- A. Construction: Volute shall be either ductile iron or cast iron. Impellers shall be semi-open design and shall be constructed of 316 SS.
- B. Mechanical seal shall have carbon/ceramic seal faces with 316 SS spring and Viton elastomers.
- C. Drive:
  - 1. Horizontal, heavy-duty, TEFC electric motor, suitable for 460-volt, 3-phase, 60-Hz AC power supply.
- D. All motors shall be designed for 1.15 service factor.
- E. Pump and motor shall be installed on a cast iron baseplate.
- F. Refer to Division 13 - Special Construction and the Contract Drawings for additional requirements.
- G. General: End suction pumps shall be suitable in all parts and materials for the specified pumped fluid and they shall conform to the following requirements:

- 1. Number of pumps (2)
- 2. Location Pipe Gallery
- 3. Service Settled Backwash Sludge
- 4. Operation (hours per day) <1

H. Operating Conditions:

- 1. Design capacity (gpm) 50 GPM
- 2. Pump design head (TDH-ft) 17 ft
- 3. Shut-Off Head (ft) 20 ft

- |                     |         |
|---------------------|---------|
| 4. Percent Solids   | 1% - 2% |
| 5. Pump speed (rpm) | 870     |
| 6. Motor size (hp)  | 1.5     |
- I. Pump Dimensions:
- |                                   |        |
|-----------------------------------|--------|
| 1. Min size suction flange (in)   | 3"     |
| 2. Min size discharge flange (in) | 1-1/2" |
- J. End suction pumps shall be manufactured by Peerless Pumps, Pentair, Goulds Pumps, or Engineer approved equal.
- K. The sludge pump design is based upon Peerless Pumps, Model 1.5X3-10 with 10-inch impeller. Any proposed "OR EQUAL" pump suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

## 2.3 SPECIAL TOOLS AND SPARE PARTS

- A. Refer to Section 01730 – Operation and Maintenance Data.
- B. Provide one complete set of all special tools required for maintenance of the pumping units.
- C. Provide the following spare parts for each pump:
1. One mechanical seal.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Install end suction pumps and related appurtenances according to the manufacturer's printed instructions, as indicated and specified.
- B. Disinfect or flush pumps in accordance with manufacturer's printed instructions, as indicated and specified.
- C. All equipment shall be field tested in accordance with this Section of the Specifications.
- D. Equipment failing to meet specific conditions shall be removed and replaced at no additional cost to the Owner.
- E. Install identifying labels permanently to equipment.
- F. Energize no equipment except by manufacturer's factory service representative, until authorized in writing.

### 3.2 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.
- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 CLEANING

- A. After installation is complete and piping connections made, clean transfer pumps in accordance with manufacturer's recommendations. Remove all debris from piping systems prior to cleaning transfer pumps.

### 3.4 SHOP PAINTING

- A. Both the inside and outside surfaces of all ferrous materials, equipment, and devices shall be thoroughly cleaned at the shop.
- B. All ferrous parts/components, except machine surfaces and others obviously not to be painted, and as otherwise specified hereinbefore (including referenced AWWA Standards), shall be furnished with primer coats of rust inhibitive primer compatible as specified in Division 9 – Finishes. Where applicable, surface preparation and primer coating shall be as specified in Division 9 – Finishes. All machined surfaces subject to corrosion shall be coated with a rust preventer/inhibitor prior to shipment. Contractor shall follow Manufacturer's recommendations for preventing corrosion prior to installation and operation.

### 3.5 PAINT

- A. Equipment shall be painted and stenciled in accordance with Division 9.

### 3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 11313

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 11312

### MULTI-STAGE IN-LINE VERTICAL PUMPS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

##### 1.2 SCOPE OF WORK

- A. Furnish, install, and field test variable speed, in-line vertical centrifugal type pump, with all required appurtenances necessary for a complete installation as indicated on the drawings and herein specified.
- B. The term “pumping unit” or “units” shall be defined as a complete pumping assembly, including pump body, casing, impeller, base, coupling, mechanical seal, motor, controls, and any associated accessories and appurtenances specified herein or required for proper operation.
- C. All items herein specified shall be provided by the pump manufacturer. Pump manufacturer is responsible for insuring that all equipment required is provided, and that it is compatible and suitable for the application.
- D. The specifications and drawings adequately describe the system, but do not purport to cover all required details. Provide all appurtenances required, whether specifically noted herein or not, at no additional cost to the owner.
- E. Pumps shall be constructed with appropriate materials for continuous service suitable for drinking water.
- F. The pump manufacturer shall be responsible for supplying the complete pumping unit as defined above and shall assume complete pumping-unit responsibility.

##### 1.3 SUMMARY OF WORK

- A. Related Sections include the following:
  - 1. Division 1 – General Requirements
  - 2. Division 9 – Finishes
  - 3. Division 11 – Equipment
  - 4. Division 13 – Special Construction

5. Division 16 – Electrical

B. Work not included:

1. Variable frequency drives (VFDs) shall be provided under Division 16.

1.4 DESCRIPTION

A. General

1. Items under this Section include, but are not limited to, components including pump base, pump wet end, coupling, coupling guards, and motor.

B. Provisions

1. Drawings and specifications indicate general arrangement and layout based upon pumping equipment supplied by hereinafter specified manufacturers. If equipment accepted requires arrangement, dimensions, or designs which differ from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.
2. Drawings and specifications direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment, controls, or appurtenances.
3. Conduit, wire, and connections for electrical power are shown on electrical drawings. In the event that the system proposed requires additional power, wiring or starters other than what is shown on electrical drawings, Contractor is fully responsible for any additional electrical costs.
4. Electrical equipment and materials shall be listed by UL wherever standards have been established by that agency.

C. Conditions of Service

1. Well Station #2 pumps will handle groundwater with minimal solids content.
2. Finished water pumps will handle finished water with minimal solids content.
3. Recycle pumps will handle settled backwash supernatant water with some solids content.
4. Pertinent elevations, dimensions, and design conditions are indicated on the Contract Drawings and in the Mechanical Schedule of the Contract Drawings.

1.5 SUBMITTALS

- A. Submit the following in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein:

B. Additional submittals hereinafter specified, for Engineer's approval.

1. Shop test results
2. Field test results
3. Equipment certification

C. Additional Submittals

1. Certified head/capacity rating curves for each required pump. Plot the following as ordinates versus flow rate as the abscissa for 100 percent pump speed, and for 90 percent, 80 percent, and 70 percent speed:
  - a. Total Dynamic Head
  - b. Pump Efficiency
  - c. Brake Horsepower
  - d. Required NPSH
2. The following information:
  - a. Maximum allowable speed
  - b. Maximum allowable flow
  - c. Maximum allowable impeller diameter
  - d. Maximum allowable horsepower (torque)
3. Certification the pump will not exhibit cavitation.
4. Complete start-up instructions. Followed by certified Start-up Report.
5. Wiring diagrams detailing wiring for power, signal, and control systems and differentiating clearly between manufacturer-installed and field installed wiring.
6. Operation and Maintenance Manuals: Submit materials for inclusion in Operating and Maintenance Manuals specified in Division 1.

## 1.6 QUALITY ASSURANCE

- A. Consideration given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, and performance equal to that specified.
- B. To ensure unity of responsibility, the pumping units shall be supplied, tested, inspected, certified, started-up and warranted by the pump manufacturer.

- C. Provide in accordance with Section 01400 - Quality Assurance and as specified.
- D. The pumping units specified under this section are to be standard pumping equipment (for use in the specified Conditions of Service) manufactured by a company with no less than fifteen years experience in the manufacture of referenced pumping equipment. Upon request by the engineer, the manufacturer shall provide proof of such experience by providing installation lists, brochures, descriptive and annotated catalog cuts describing the equipment systems being proposed, etc.
- E. Manufacturing and testing shall comply with “Hydraulic Institute Standards for Centrifugal, Rotary & Reciprocating Pumps”.
- F. Workmanship and Design
  - 1. All parts to be amply proportioned for long, continuous, and uninterrupted service. Provisions shall be made for easy lubrication, adjustment, or replacement of all parts. Corresponding parts of multiple units shall be inter-changeable.
  - 2. All materials used in construction of equipment shall be of best quality and entirely suitable in every respect for the required service and duty requirements.
- G. Shop Testing
  - 1. General
    - a. Shop test new pumps and motors. Motor shop test data shall be provided. Approval of pump and motor test results by the Engineer must be granted prior to shipping – NO EXCEPTIONS.
    - b. The motors being furnished may be shop tested at the motor manufacturer's facility. Motor routine test shall include winding resistance, locked rotor, no load, high potential, and insulation resistance.
    - c. In the event that a pump or motor fails to perform as specified during the test, make all modifications required to place the unit in conformance with the specifications, and retest, at no additional cost to the Owner.
    - d. In the event that a pump or motor unit fails a second test, the unit will be rejected without recourse, and must be replaced with a unit equal to that specified, which passes the required tests.
    - e. All tests shall be performed in accordance with the Hydraulic Institute Test Standard 14.6 - Latest Edition.
  - 2. Performance Testing
    - a. Individually performance test each pump/motor unit on water in conformance with the Hydraulic Institute Standards.

- b. The pumps shall be tested at 100 percent speed. Acceptance criteria shall be HI Grade 3B. Shut-off head plus four head/capacity points shall be measured. For each test, the following data shall be collected and reported:
  1. Rate of Flow
  2. Total Head
  3. Power Draw

### 3. Submission of Test Results

- a. All data shall be submitted on 8-1/2 x 11 inch sheets at as large a scale as is practical.
- b. Plot curves for all performance data, corrected to standard conditions.

## H. Field Testing

1. Field tests shall be performed by the Contractor on all pumping systems under the instruction of the field service engineer. All field testing to be witnessed by the Owner/Engineer in the field.
2. Ensure that all components perform as specified.
  - a. Test each pump at 70 percent, 90 percent, and 100 percent speed. At each speed collect and report the following data at shut off head and head/capacity data three equally spaced points over the full range of the curve:
  - b. Confirm current draw does not exceed nameplate FLA
  - c. Perform field vibration testing to confirm vibration is within allowable limits as specified in HI 9.6.4.
3. In the event that a pumping unit fails to pass a test, make all modifications (at no cost to the owner) required to place the unit in proper working order, and retest.
4. In the event that a unit fails a test a second time, remove the unit and replace with a satisfactory one, at no cost to the owner.
5. Submit all scheduling and procedures to the Engineer for approval.
6. The Contractor shall provide all necessary instrumentation (with calibration certificates), equipment, devices and appurtenances, as well as any temporary wiring or piping, required to perform required field tests.

7. Provide written test procedures which describe the proposed means and methods to be used in conducting necessary field tests. Field testing shall not be completed without written test procedures. Engineer to witness all field testing.
8. Submit certification of successfully conducted field tests and results to Engineer.

#### 1.7 OPERATION AND MAINTENANCE INSTRUCTION MANUALS

- A. Operation and Maintenance Manuals: Submit materials for inclusion in Operating and Maintenance Manuals specified in Division 1.
- B. Furnish six (6) complete sets of Operations and Maintenance Instruction Manuals (O&M Manuals) prior to start-up. Furnish one (1) electronic Adobe PDF searchable version on thumb drive or CD-ROM.
- C. O&M manuals shall be prepared with clear instructions which will enable the Owner's personnel to operate and maintain the pumping equipment and systems.
- D. The manuals shall be prepared specifically for each installation. General literature from the equipment manufacturer that is not specifically applicable to the operation and maintenance of the installed items shall not be acceptable.
- E. The manuals shall be comprehensive and as a minimum contain:
  1. Description and operating instruction for all mechanical components.
  2. Instructions relevant to all modes of equipment operation.
  3. Service and trouble-shooting instructions of equipment supplied.
  4. Procedures for the adjustment of equipment at initial start-up, during routine preventative maintenance, and following replacement or repair.
  5. Instructions for testing and calibration of electronic components as may be required to determine proper performance.
  6. Detailed operating instructions for normal and emergency operation conditions.

#### 1.8 REFERENCES

- A. Where herein specified or applicable.

AFBMA	Anti-Friction Bearing Manufacturers Association
API	American Petroleum Institute
HIS	Hydraulic Institute Standards
NBS	National Bureau of Standards
SAE	Society of Automotive Engineers

## 1.9 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to concrete structures and insets required.
- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.

## 1.10 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01610 - Delivery, Storage, and Handling and as specified herein. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
- C. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.
- D. Store and safeguard equipment, material and spare parts.
- E. Grease coat all exposed ferrous surface prior to shipping, to prevent corrosion during on site storage.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. Vertical multistage pumps as manufactured by Grundfos are the basis of design. Contract documents were developed based on the Grundfos pump models specified. Should the Contractor propose to furnish another named manufacturer, any changes to structures, pipe, fittings, cabling, conduit, etc. required to accommodate the other manufacturers shall be provided at no additional cost.
- B. Pump performance parameters shall be as indicated on the Contract Drawings.
- C. Well Station 2 raw water pump drawings and specifications indicate general arrangement and layout based upon pumping equipment supplied by Grundfos Model CRN 64-3 with a 5.59-inch impeller. If equipment accepted requires arrangement, dimensions, or designs which differ from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.
- D. Finished water pump drawings and specifications indicate general arrangement and layout based upon pumping equipment supplied by Grundfos Model CRN 125-2 with a 6.38-inch impeller. If equipment accepted requires arrangement, dimensions, or designs which differ from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.

- E. Recycle water pump drawings and specifications indicate general arrangement and layout based upon pumping equipment supplied by Grundfos Model CRN 5-11-3ph with a 2.88-inch impeller. If equipment accepted requires arrangement, dimensions, or designs which differ from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.
- F. All pump components shall be of sufficient strength and design to withstand operation at shut-off head for a minimum of ten (10) minutes without damage or reduced component life.
- G. Provide anchor bolts under this section in conformance with the requirements specified elsewhere.
- H. Structural steel components where required shall be in conformance with ASTM Designation A36.
- I. Shop painting, field painting, and protective coatings are required as specified in Division 9 - Finishes.
- J. All major pump components shall be furnished with lifting lugs or eye bolts to facilitate handling and/or equipment removal for maintenance. The lugs or bolts shall be designed or arranged to allow safe handling of the pump components singly or collectively as required during shipping, installation, and maintenance.
- K. Unless otherwise specified, each piece of the new pump shall be assembled in the Pump Manufacturers facility to ensure the correctness of the fabrication and matching of the component parts. Shop assembly shall be marked to assure the same position when assembled in the field.

## 2.2 MULTI-STAGE IN-LINE VERTICAL PUMP

- A. The pump end shall be of the vertical multi-stage design with the motor mounted directly to the top of the pump. The pump models shall be furnished as shown on the Drawings and installed in accordance with the recommendations of the manufacturer.
- B. The pump shall be compatible for potable water applications and/or NSF 61 approved.
- C. Net Positive Suction Head Allowed (NPSHa) and Net Positive Suction Head Required (NPSHr) for each pump shall be as follows:
  - 1. Well 2 Raw Water Pumps: The maximum NPSHa shall be 23 ft. The NPSHr shall be 18 feet or less.
  - 2. Finished Water Pumps: The maximum NPSHa shall be 29 ft. The NPSHr shall be 24 feet or less.
  - 3. Recycle Water Pumps: The maximum NPSHa shall be 33 ft. The NPSHr shall be 28 feet or less.

## 2.3 MATERIALS OF CONTRUCTION

A. For Well 2 Raw Water Pumps, materials of construction shall be:

Base plate:	Cast Iron, ASTM 88-55-06
Pump head cover/base:	CF 8MStainless Steel
Motor stool:	Cast Iron, ASTM Class 25B
Impellers:	316 stainless steel
Diffuser chambers:	316 stainless steel
Outer sleeve:	316 Stainless Steel
Shaft:	Duplex stainless steel
Bearing rings:	Silicon Carbide
O-rings:	EPDM

A. For Finished Water Pumps, materials of construction shall be:

Base:	CF8M stainless steel
Base Plate:	Ductile iron, ASTM A536-84 70-50-05
Motor stool:	Ductile iron, ASTM A536-84 70-50-05
Shaft:	AISI 318 LN stainless steel
Pump Head:	CF8M stainless steel
Impellers:	AISI 316 stainless steel
Chamber:	AISI 316 stainless steel
Sleeve:	AISI 304 or AISI 316 L stainless steel
Bearing Ring:	Tungsten carbide
O-rings:	EPDM

B. For Recycle Water Pumps, materials of construction shall be:

Pump head/base plate:	Cast iron, ASTM Class 30
Pump head cover/base:	CF 8M stainless steel
Impellers:	316 stainless steel
Diffuser chambers:	316 stainless steel
Outer sleeve:	316 stainless steel or 329 stainless steel
Shaft:	Duplex stainless Steel
Bearing rings:	Silicon Carbide
O-rings:	EPDM

## 2.4 ACCESSORIES

A. Motors larger than 20 HP shall be furnished with lifting lugs or eye bolts to facilitate handling. The lugs or bolts shall be designed or arranged to allow safe handling of the pump components singly or collectively as required during shipping, installation, and maintenance.

## 2.5 VACUUM PRIMING SYSTEM

A. A vacuum priming system shall be provided for the Well Station 2 Raw Water Pumps in accordance with Section 11371.

B. Both the finished water pumps and recycle pumps will be flooded suction.

## 2.6 MOTORS

- A. Pump motors shall be provided under this Section. They shall be in conformance with Division 16 - Electrical, with additional requirements specified herein and as indicated on the Contract Drawings. If required, motors shall be inverter duty suitable for operation with Variable Frequency Drives.
- B. Provide all motors with service factor of 1.15 over nameplate rating, of sufficient rated horsepower to provide non-overloading operation throughout the operating range indicated on the drawings.
- C. Starting characteristics required:
  - 1. NEC Code Letter F.
  - 2. Accelerate pump to full speed against a closed valve in 15 seconds or less.
- D. Temperature Rise Allowable: Maximum of 80 °C at nameplate horsepower, as measured by imbedded motor stator thermostats, at an ambient temperature of 40 °C.
- E. Noise Level Allowable: Maximum of 85 dBA measured five feet from motor.
- F. Each motor shall be designed for the highest efficiency standard available in the marketplace.
- G. Motor Voltage: as indicated on drawings.
- H. Motor starting current shall not exceed 650 percent of the motor full load current. Motors shall be Premium Efficiency type in accordance with NEMA specifications for premium efficiency motors.
- I. Motors shall be commercially balanced.
- J. Motor Bearings and Shaft Grounding Ring
  - 1. Provide heavy duty ball bearings
    - a. Grease lubricated type.
    - b. Designed for maximum radial and thrust loads which will occur.
    - c. Minimum L10 bearing life of 17,500 hours.
  - 2. Provide shaft grounding ring to protect bearings from damage caused by shaft currents.

K. Accessories required

1. The pump motor manufacturer shall provide motors with winding temperature detectors. The winding temperature detectors shall be motor overstats (bi-metallic switches).
2. Motor nameplates shall be bronze or stainless steel and shall be securely fastened to the motor frame with pins of like material. The nameplate shall contain, as a minimum, the following information:
  - a. Rated horsepower
  - b. Full Load Amps
  - c. Full Load Speed
  - d. Frequency
  - e. NEMA kVA code and design letter
  - f. Rated voltage
  - g. Manufacturer's serial number
  - h. Service Factor
  - i. Insulation Class
  - j. Maximum ambient temperature
  - k. Maximum temperature rise
  - l. Full load current at nameplate voltage
  - m. Frame designation
  - n. Hydraulic rating point (GPM @ Ft. TDH)

L. Motor shall be provided with TEFC enclosure.

2.7 SPECIAL TOOLS AND SPARE PARTS

- A. Provide one complete set of all special tools required for maintenance of the pumping units.
- B. Provide the following spare parts for each pump:
  1. One seal kit.
  2. One gasket kit.

3. One impeller stack kit.
4. One bearing kit.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Install all items with care, and in accordance with printed recommendations of manufacturer.
- B. Handle all coated ferrous items with canvas or nylon slings or other suitable methods to avoid damaging the coating.
- C. Energize no equipment, except by manufacturer's serviceman, until authorized in writing.
- D. Installation conducted in accordance with applicable Hydraulic Institute Standards. Dynamically balance the pump shaft/impeller assembly to insure a maximum vibration velocity, after installation, of 0.2 inches per second, as measured according to the Hydraulic Institute Standards.
- E. Well 2 Raw Water Pump installation shall be coordinated with the Vacuum Priming System, Section 11310.
- F. Alignment
  1. Maintain alignment through the use of shouldered fits, or dowels or turned bolts placed in reamed holes. Unless otherwise approved, alignment methods depending upon friction between mating parts are not acceptable.
  2. Establish proper alignment through the use of dial indicators. Submit alignment procedure for review and approval, in the event that field alignment is required.
  3. Alignment shall be in conformance with manufacturer's written tolerance limits.
  4. Proper alignment of all components shall be confirmed by qualified, factory engineer. Submit factory engineer's certified statement verifying proper alignment.
- G. The Well 2 Raw Water Pumps shall be suitable and compatible with the Vacuum Priming System. The Well 2 Raw Water Pumps shall not be energized until the Vacuum Priming System is installed and tested.
- H. Install identifying labels permanently to equipment.

### 3.2 WARRANTY

- A. The equipment manufacturer shall warrant all parts to be free from defective material and workmanship for a period of twenty four (24) months from startup, not to exceed 30 months from shipment.

- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 FACTORY TEST, FIELD TEST, AND QUALITY CONTROL

- A. The Contractor shall have the Pump Manufacturer factory representative present during field installation. It shall be the Contractor's responsibility to obtain the recommended installation procedures directly from the Manufacturer, and comply with same.
- B. Contractor shall have the Pump Manufacturer provide a factory service representative who has complete knowledge of the operation of the pumping system, including mechanical, electrical, control, and alarm components as necessary to perform field testing and initial start-up to assure and demonstrate the proper performance of all equipment and pump components.
- C. Field tests shall be performed by the Contractor under the instruction of the field service engineer. All field testing to be witnessed by the Engineer in the field. Provide advanced notice of field testing in accordance with 01650 – Facility Start-up/Commissioning. Submit certification of successfully conducted field tests.
- D. Field tests and training shall meet the requirements specified in this section.

### 3.4 TRAINING

- A. The Contractor shall provide operation and maintenance training for the pumping units performed by qualified manufacturer's service representatives as specified in Division 1. The training shall total no less than four (4) hours (not including travel time) for each pumping unit after all pumps have been field tested and certified. Training shall be scheduled separately from installation checkout and testing, unless approved by the Engineer.

### 3.5 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 - Contract Closeout.

END OF SECTION 11312

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 11313

### CHEMICAL TRANSFER PUMPS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

- 1. Centrifugal Chemical Transfer Pumps

- B. Related Sections include the following:

- 1. Division 1 – General Requirements

- 2. Division 9 – Finishes

- 3. Division 11 – Equipment

- 4. Division 13 – Special Construction

- 5. Division 16 – Electrical

##### 1.3 SYSTEM DESCRIPTION

- A. The Contractor shall furnish and install the chemical transfer pumps as shown on the Contract Drawings. The chemical transfer pumps shall be magnetic drive centrifugal transfer pumps including all accessories as described herein. The pumps shall be fully compatible with the chemicals being pumped.

- B. The pump manufacturer is responsible for ensuring that all equipment and systems required for a complete operating system are provided, and compatible and suitable for the project conditions.

- C. The equipment covered by these Specifications shall be standard equipment of proven ability as supplied by reputable suppliers having a long experience in the production of such equipment.

##### 1.4 SUBMITTALS

- A. The shop drawing submittals for each chemical transfer pump shall contain performance curves, showing that they meet requirements for head, capacity,

horsepower, efficiency, and related design conditions; plans and sections showing dimensions; materials of construction; details; design data; test reports; operation and maintenance manuals; warranty; and installation instructions.

- B. Shop drawings shall be submitted for all appurtenances, including electrical and instrumentation wiring diagrams, and all other associated equipment. A chemical area layout plan indicating pumps, tanks, and equipment pad locations shall be provided by the Contractor for Engineer/Town approval prior to installation.
- C. Operation and Maintenance Manuals: Include manufacturer's instructions for equipment installation, start-up, operation, and maintenance, including parts lists for operation and maintenance manuals specified in Section 01730 – Operation and Maintenance Data.

#### 1.5 QUALITY ASSURANCE:

- A. Comply with applicable parts of Section 01400 – Quality Assurance.
- B. Consideration given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, and performance equal to that specified.
- C. Workmanship and Design
  - 1. All parts to be amply proportioned for long, continuous, and uninterrupted service. Provisions shall be made for easy lubrication, adjustment, or replacement of all parts. Corresponding parts of multiple units shall be inter-changeable.
  - 2. The design and proportioning of all parts shall provide liberal strength, stability, and stiffness, and be especially adapted for the application. Ample room and facility for inspection, repairs, and adjustments shall be provided.
  - 3. All materials used in construction of equipment shall be of the best quality and shall be entirely suitable in every respect for the required service.
- D. Field Testing of Chemical Transfer Pumps
  - 1. Field tests shall be performed by the Contractor under the instruction of the field service engineer.
  - 2. Ensure that all components perform as specified.
    - i. Run a test on each pump at 100% speed. Collect and report the following data at shut-off head and at three equally spaced points over the full range of the head capacity curve:
      - (a) Flow/head
      - (b) Amperage, voltage, and power factor
    - ii. Motor current and power not to exceed the nameplate data (adjusted for operating voltage as field measured).

3. In the event that a pumping unit fails to pass a test, make all modifications required to place the unit in proper working order, and retest.
4. In the event that a unit fails a test a second time, remove the unit and replace with a satisfactory one, at no cost to the owner.
5. All tests shall be in conformance with the applicable Hydraulic Institute Standards.
6. Submit all scheduling and procedures to the Engineer for approval.
7. Provide all instrumentation, equipment, and appurtenances, as well as any temporary wiring or piping, required to perform the tests.
8. Submit certification of successfully conducted field tests, including test results.

#### 1.6 OPERATIONS AND MAINTENANCE INSTRUCTION MANUALS

- A. Operation and Maintenance Manuals: Submit materials for inclusion in Operation and Maintenance Manuals specified in Section 01730 – Operation and Maintenance Data.
- B. Furnish Operation and Maintenance Instruction Manuals (O&M Manuals) prior to start-up.
- C. O&M manuals shall be prepared with clear instructions that will enable the Owner's personnel to operate and maintain all chemical transfer pump systems.
- D. The manuals shall be prepared specifically for each installation. General literature from the equipment manufacturer that is not specifically applicable to the operation and maintenance of the installed items shall not be acceptable.
- E. The manuals shall be comprehensive and as a minimum contain:
  1. Description and operating instruction for all mechanical components.
  2. Instructions relevant to all modes of equipment operation.
  3. Service and trouble-shooting instructions of equipment supplied.
  4. Procedures for the adjustment of equipment at initial start-up, during routine preventative maintenance, and following replacement or repair.
  5. Instructions for testing and calibration of electronic components as may be required to determine proper performance.
  6. Detailed operating instructions for normal and emergency operation conditions.
  7. As-Built Mechanical drawings and dimensional information showing the actual layout and location of equipment components within the structures.

## 1.7 EXTRA MATERIALS

- A. Furnish items expected to require replacement or to be consumed during normal operation within the first year of operation. Furnish one set of spare parts for each individual unit furnished and installed.

## 1.8 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to concrete structures and insets required.
- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.

## 1.9 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01610 – Delivery, Storage, and Handling and as specified herein. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
- C. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.
- D. Store and safeguard equipment, material and spare parts.
- E. Grease coat all exposed ferrous surface prior to shipping, to prevent corrosion during on site storage.

## PART 2 – PRODUCTS

### 2.1 CHEMICAL TRANSFER PUMPS

- A. One (1) magnetic drive centrifugal transfer pump shall be supplied for the following chemical feed systems:
  - 1. Potassium Hydroxide
  - 2. Pre-Filtration Sodium Hypochlorite
  - 3. Post-Filtration Sodium Hypochlorite
  - 4. Sodium Bisulfite
- B. Drawings and specifications indicate general arrangement and layout based on pumping equipment supplied by hereinafter specified manufacturers. If equipment accepted requires arrangement, dimensions, or design that differs from that indicated

or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.

- C. Electrical equipment and materials shall be listed by Underwriters' Laboratories, Inc. wherever standards have been established by that agency.
- D. The equipment covered by these specifications is intended to be of proven ability as manufactured by reputable concerns having long experience in the production of such equipment. The equipment furnished shall be designed and constructed in accordance with the best practice and methods.
- E. All components of the equipment shall be engineered for long, continuous, and uninterrupted service. Provisions shall be made for easy lubrication, adjustment, or replacement of all parts. Corresponding parts of multiple units shall be interchangeable.
- F. Harnessed flexible pipe couplings or their approved equivalent shall be installed on the inlet and discharge piping of each pump in a manner that the pump will be free of forces of consequential magnitude transmitted thereto by the piping. Such provisions for eliminating pipe strain shall be furnished and installed whether shown or not.

## 2.2 CHEMICAL TRANSFER PUMP REQUIREMENTS

- A. Construction: All transfer pump wetted materials shall be chemically compatible with pumped chemical.
- B. Drive:
  - 1. The plastic body chemical pumps 3 HP or less shall have horizontal, heavy-duty, TEFC electric motor, suitable for 460-volt, 3-phase, 60-Hz AC power supply. Motors shall be chemical mill duty rated with corrosion resistance.
- C. All motors shall be designed for 1.15 service factor.
- D. Refer to Division 13 - Special Construction and the Contract Drawings for additional requirements.
- E. Chemical transfer pumps shall be manufactured by Finish Thompson, March Pumps, Goulds Pumps, or Engineer approved equal.

## 2.3 PUMP NAME: Potassium Hydroxide Transfer Pump (TP-502)

- A. General: Plastic body chemical pumps shall be suitable in all parts and materials for the type of chemical involved and they shall conform to the following requirements:
  - 1. Number of pumps (1)
  - 2. Location Potassium Hydroxide Storage Area
  - 3. Service Transfer Pump

4. Operation (hours per day) <1

B. Operating Conditions:

- 1. Design capacity (gpm) 50 GPM
- 2. Pump design head (TDH-ft) 25 ft
- 3. Shut-Off Head (ft) 33 ft
- 4. Liquid to be pumped Potassium Hydroxide 45%
- 5. Specific gravity of liquid 1.45
- 6. Max pump speed (rpm) 3450
- 7. Min motor size (hp) 1
- 8. Max motor speed (rpm) 3450

C. Pump Dimensions:

- 1. Min size suction flange (in) 2"
- 2. Min size discharge flange (in) 1-1/2"

D. The chemical transfer pump design is based upon Finish Thompson Inc., Model DB7 with 3.18-inch impeller. Any proposed "OR EQUAL" chemical transfer pump suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

2.4 PUMP NAME: Pre-Filtration Sodium Hypochlorite Transfer Pump (TP-403)

A. General: Plastic body chemical pumps shall be suitable in all parts and materials for the type of chemical involved and they shall conform to the following requirements:

- 1. Number of pumps (1)
- 2. Location Sodium Hypochlorite Storage Area
- 3. Service Transfer Pump
- 4. Operation (hours per day) <1

B. Operating Conditions:

- 1. Design capacity (gpm) 27 GPM
- 2. Pump design head (TDH-ft) 13.8 ft
- 3. Shut-Off Head (ft) 26 ft

- |                               |                           |
|-------------------------------|---------------------------|
| 4. Liquid to be pumped        | Sodium Hypochlorite 12.5% |
| 5. Specific gravity of liquid | 1.20                      |
| 6. Max pump speed (rpm)       | 3450                      |
| 7. Min motor size (hp)        | 1/2                       |
| 8. Max motor speed (rpm)      | 3450                      |

C. Pump Dimensions:

- |                                   |    |
|-----------------------------------|----|
| 1. Min size suction flange (in)   | 1” |
| 2. Min size discharge flange (in) | 1” |

D. The chemical transfer pump design is based upon Finish Thompson Inc., Model DB6 with 2.75-inch impeller. Any proposed “OR EQUAL” chemical transfer pump suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

2.5 PUMP NAME: Post-Filtration Sodium Hypochlorite Transfer Pump (TP-406)

E. General: Plastic body chemical pumps shall be suitable in all parts and materials for the type of chemical involved and they shall conform to the following requirements:

- |                              |                                  |
|------------------------------|----------------------------------|
| 1. Number of pumps           | (1)                              |
| 2. Location                  | Sodium Hypochlorite Storage Area |
| 3. Service                   | Transfer Pump                    |
| 4. Operation (hours per day) | <1                               |

F. Operating Conditions:

- |                               |                           |
|-------------------------------|---------------------------|
| 1. Design capacity (gpm)      | 23 GPM                    |
| 2. Pump design head (TDH-ft)  | 11 ft                     |
| 3. Shut-Off Head (ft)         | 21 ft                     |
| 4. Liquid to be pumped        | Sodium Hypochlorite 12.5% |
| 5. Specific gravity of liquid | 1.20                      |
| 6. Max pump speed (rpm)       | 3450                      |
| 7. Min motor size (hp)        | 1/2                       |
| 8. Max motor speed (rpm)      | 3450                      |

G. Pump Dimensions:

1. Min size suction flange (in) 1”
2. Min size discharge flange (in) 1”

H. The chemical transfer pump design is based upon Finish Thompson Inc., Model DB6 with 2.5-inch impeller. Any proposed “OR EQUAL” chemical transfer pump suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

2.6 PUMP NAME: Sodium Bisulfite Transfer Pump (TP-402)

I. General: Plastic body chemical pumps shall be suitable in all parts and materials for the type of chemical involved and they shall conform to the following requirements:

1. Number of pumps (1)
2. Location Sodium Bisulfite Storage Area
3. Service Transfer Pump
4. Operation (hours per day) <1

J. Operating Conditions:

1. Design capacity (gpm) 23 GPM
2. Pump design head (TDH-ft) 11 ft
3. Shut-Off Head (ft) 21 ft
4. Liquid to be pumped Sodium Bisulfite 38%
5. Specific gravity of liquid 1.30-1.37
6. Max pump speed (rpm) 3450
7. Min motor size (hp) 1/2
8. Max motor speed (rpm) 3450

K. Pump Dimensions:

1. Min size suction flange (in) 1”
2. Min size discharge flange (in) 1”

L. The chemical transfer pump design is based upon Finish Thompson Inc., Model DB6 with 2.5-inch impeller. Any proposed “OR EQUAL” chemical transfer pump

suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

## 2.7 CHEMICAL TRANSFER PUMP CONTROLS

- A. Provide spring loaded switch for chemical transfer pump operation. When switch is turned clockwise, the pump shall energize and shall return left to the OFF position once the switch is released.
- B. Each transfer pump control switch shall be mounted on a unistrut support within sight of the corresponding transfer pump and day tank.
- C. Refer to Division 13 – Special Construction, Division 16 – Electrical, and the Contract Drawings for additional requirements.

## 2.8 SPECIAL TOOLS AND SPARE PARTS

- A. Refer to Section 01730 – Operation and Maintenance Data.
- B. Provide one complete set of all special tools required for maintenance of the pumping units.
- C. Provide the following spare parts for each chemical transfer pump:
  - 1. One set of impeller and suction cover wearing rings and shims.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Install chemical transfer pumps and related appurtenances according to the manufacturer's printed instructions, as indicated and specified.
- B. Disinfect or flush chemical transfer pumps in accordance with manufacturer's printed instructions, as indicated and specified.
- C. All equipment shall be field tested in accordance with this Section of the Specifications.
- D. Equipment failing to meet specific conditions shall be removed and replaced at no additional cost to the Owner.
- E. Install identifying labels permanently to equipment.
- F. Energize no equipment except by manufacturer's factory service representative, until authorized in writing.

### 3.2 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.
- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 CLEANING

- A. After installation is complete and piping connections made, clean transfer pumps in accordance with manufacturer's recommendations. Remove all debris from piping systems prior to cleaning transfer pumps.

### 3.4 SHOP PAINTING

- A. Both the inside and outside surfaces of all ferrous materials, equipment, and devices shall be thoroughly cleaned at the shop.
- B. All ferrous parts/components, except machine surfaces and others obviously not to be painted, and as otherwise specified hereinbefore (including referenced AWWA Standards), shall be furnished with primer coats of rust inhibitive primer compatible as specified in Division 9 – Finishes. Where applicable, surface preparation and primer coating shall be as specified in Division 9 – Finishes. All machined surfaces subject to corrosion shall be coated with a rust preventer/inhibitor prior to shipment. Contractor shall follow Manufacturer's recommendations for preventing corrosion prior to installation and operation.

### 3.5 PAINT

- A. Equipment shall be painted and stenciled in accordance with Division 9.

### 3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 11313

## SECTION 11371

### VACUUM PRIMING SYSTEM

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. Furnish all labor, equipment, appliances, materials and performing all operations in connection with providing and installing a complete vacuum priming system as shown on the Contract Drawings and as specified herein. The vacuum priming system shall meet the approval of the Engineer.
- B. Related Sections include the following:
  - 1. Division 0 – Bidding and Contract Requirements
  - 2. Division 1 – General Requirements
  - 3. Division 9 – Painting
  - 4. Division 11 – Process Mechanical
  - 5. Division 13 – Special Construction
  - 6. Division 16 – Electrical
- C. Work included:
  - 1. The work covered under this Section of the Specifications includes the furnishing of all plant, labor, equipment, appliances, and materials, and in performing all operations in connection with the furnishing, installation, and testing of vacuum priming systems, including compressors, control panels, PLC system, air receiver, vacuum pumps, piping, valves, and appurtenant work, at the locations and to the general arrangements and details as indicated and/or as directed, complete in place, in accordance with the Contract Drawings and Specifications.

##### 1.3 SUBMITTALS

- A. The shop drawing submittals for the vacuum priming system shall contain vacuum pump curves, plans, and sections showing dimensions, materials of construction, details, design data, test reports showing rated flow and steady state accuracy at 100 percent setting, certification of factory testing, operation and maintenance manuals,

warranty, and installation instructions. Provide sequence of operations and points list for integration purposes.

- B. Shop drawings shall be submitted for all appurtenances, including water traps, priming valves, electrical and instrumentation wiring diagrams, control panels, and all other associated equipment. A vacuum priming system layout plan indicating pumps, tanks, and equipment pad locations shall be provided by Contractor for Engineer/Town approval prior to installation.
- C. Submit a legal copy of the programming software for the PLC licensed to the Town of Sharon.
- D. Certification that the Vacuum Priming System is suitable and compatible for use with the Collection Well 2 Pumps (P-100A, P-100B).
- E. Operating and Maintenance Manuals: Include manufacturer's instructions for equipment installation, start-up, operation, and maintenance, including parts lists for operation and maintenance manuals specified in Division 1.

#### 1.4 QUALITY ASSURANCE

- A. The materials and equipment covered in this specification are intended to be standard materials and equipment of proven ability as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations and these Specifications. The Specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.
- B. The Contractor's attention is directed to the fact that the vacuum priming system is an integrated system and, as such, it shall be furnished by one manufacturer which shall provide all materials, equipment and controls and accept all responsibility for the satisfactory installation and operation and control of the process. All controls for electrically operated or motor driven equipment shall be complete including all necessary auxiliary relays so as to require only wiring and connections to the equipment control circuit. All necessary fuses and switches required by the Vacuum Priming System Manufacturer shall be provided with the equipment.
- C. Provide in accordance with Section 01400 - Quality Assurance and as specified.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Provide in accordance with Section 01610 - Delivery, Storage, and Handling and as specified herein. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

- C. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.
- D. Store and safeguard equipment, material and spare parts.

## 1.6 EXTRA MATERIALS

- A. Furnish items expected to require replacement or to be consumed during normal operation within the first year of operation. Furnish one set of spare parts for each individual unit furnished and installed.

## 1.7 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to concrete structures and insets required.
- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.
- C. Manufacturer shall provide technical assistance and guidance to the Application Engineer for SCADA programming of the equipment. Equipment PLC shall be programmed per Paragraph 2.6.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. Vacuum priming system shall be an Automatic Duplex Vacuum Priming System as manufactured by Q-VAC Automatic Priming Systems, CompreVac, Inc., Premier Fluid Systems, or Engineer approved equal. System shall be a pre-packaged system that is piped and wired to the fullest extent possible prior to shipment.
- B. The drawings and specifications indicate general arrangement and description of what is required, but do not purport to cover all details entering into design and construction of the equipment, controls, and appurtenances. Drawings and specifications are, however, intended to cover furnishing, shop testing, delivering, supervision of installation, certifying and field testing all materials, equipment and appurtenances for the complete pneumatic mixing system as specified herein, whether specifically mentioned in these specifications or not.
- C. The vacuum priming system shall include two oil-lubricated rotary vane vacuum pumps, air receiver tank, control panel, isolation valves, water trap, and appurtenances.
- D. Vacuum priming system shall be compatible with the Well Station 2 Raw Water Pumps (P-100A, P-100B) and designed to vacuum prime the pump.
- E. The vacuum priming system design is based upon Q-VAC QVD-11RV-60HG-AP automatic duplex vacuum priming system. Any proposed “OR EQUAL” vacuum priming system supplier’s work and Contractor’s work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

## 2.2 ROTARY VANE VACUUM PUMPS

- A. The vacuum priming system shall be equipped with two (2) rotary vane vacuum pumps.
- B. Drawings and specifications indicate general arrangement and layout based upon pumping equipment supplied by QVAC Duplex Vacuum Priming System. If equipment accepted requires arrangement, dimensions, or designs which differ from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.
- C. The vacuum pump shall be of oil-lubricated rotary vane design with a minimum ultimate vacuum rating of 29 mmHg.
- D. The maximum noise level of each pump shall be 62 dB(A) or less.
- E. The vacuum pump shall be integrally flanged to a 0.6 horsepower TEFC motor wired for operation.
- F. Belt drives shall not be permitted.
- G. The vacuum pump shall be constructed primarily of cast iron.
- H. Vacuum pump shall be equipped with three non-metallic, non-asbestos vanes. Multiple stages of liquid and aerosol oil separation shall be integral to the pump to ensure clean discharge air. A gas ballast valve must be included to improve moisture handling. An oil drain valve shall be piped to the edge of priming system for ease of maintenance. The vacuum pump assembly shall be supplied with the following equipment connected to the inlet: a 5-micron inlet filter; secondary inlet check valve; vacuum release valve with silencer, pump isolation valve; and a flexible connector for a vibration free attachment.
- I. Each vacuum pump shall be filled with vacuum pump oil. Oil shall be NSF 61 approved.

## 2.3 AIR RECEIVER

- A. The air receiver tank shall be a galvanized 60 gallon horizontal air receiver functioning as a vacuum storage vessel.
- B. The air receiver shall be coded to ASME Section VIII, Div. I, and be rated for 200 psi working pressure at 450 degrees F.
- C. The receiver shall include a sight gauge for visual inspection of water accumulation within the receiver; a protective high water level switch to shut down the system and provide an alarm if the receiver begins to flood; a vacuum release valve with silencer to facilitate draining; a manual drain valve for draining accumulated water; and an inlet ball valve to isolate the priming system from the process vacuum line.

## 2.4 WATER TRAP

- A. An inline water trap shall be furnished by the priming system manufacturer to help protect the system from slugs of water due to a priming valve leak or failure.
- B. The water trap shall include 3/4" FNPT isolation valves, a corrosion resistant aluminum head, clear polycarbonate housing, internal baffle, stainless steel separator screen and float ball, elastomer seat, vacuum release valve with silencer, drain valve, and liquid filled vacuum gauge.

## 2.5 VACUUM PRIMING VALVE

- A. A priming valve shall be furnished for each pump serviced by the priming system.
- B. The priming valve shall be constructed of cast iron with 316 stainless steel trim.
- C. The internal and external valve body shall include a fusion bonded epoxy coating for abrasion and chemical resistance.
- D. A SPDT water level switch with weatherproof enclosure shall be provided with brass installation fittings to provide a prime verification signal or interlock with each pump.

## 2.6 CONTROL PANEL

- A. Automatic controls shall be utilized for maintaining preset vacuum levels and to ensure peak system operation and safety.
- B. Controls shall be housed in NEMA 4 enclosure with UL508 panel shop rating and shall include:
  - 1. Main disconnect switch with lockable handle
  - 2. Motor starters with UL Class 10 motor overload relays
  - 3. Control voltage transformer
  - 4. Green LED pump running lights
  - 5. H-O-A selector switches
  - 6. Local-Remote selector switch
  - 7. Remote Start-Stop contact for a 115VAC remote start signal
  - 8. Vacuum transducer, 0.5% FS accuracy, 4-20 mA
  - 9. Alarm horn
  - 10. Alarm silence push button

11. Red LED Alarm light

12. PLC controller with 4.3” color LCD touchscreen. The Town of Sharon has standardized their PLC system on Allen-Bradley PLC Micrologix 1400 (**No substitutions shall be allowed**). PLC shall be programmed and tested prior to shipment, and shall be re-programmed in the field as required to provide a complete, functional system.

13. Dry contacts for SCADA monitoring as shown on I drawings and as specified in Division 13.

## 2.7 ACCESSORIES

A. Refer to Section 11200 for piping and valve requirements.

## 2.8 SHOP/FACTORY FINISHING

A. Furnish manufacturer’s standard enamel finish, color as selected. All external ferrous surfaces shall be uniformly primed and painted by the manufacturer to provide a high quality protective finish and uniform color.

B. Different coatings on the receiver and other major components shall not be permitted.

C. All ferrous surfaces must be sound, dry, clean and free of oil, grease, dirt, mildew, release agents, curing compounds, efflorescence, loose and flaking paint and other foreign substances.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

A. General: Install equipment on vibration isolators in accordance with manufacturer’s instructions.

B. Piping: Each pump shall be equipped with full-size flexible discharge connection, check valves, and PVC isolation ball valve.

C. Install all items with care, and in accordance with printed recommendations of manufacturer.

D. Handle all coated ferrous items with canvas or nylon slings or other suitable methods to avoid damaging the coating.

E. Alignment

1. Maintain alignment through the use of shouldered fits, or dowels or turned bolts placed in reamed holes. Unless otherwise approved, alignment methods depending upon friction between mating parts are not acceptable.

2. Submit alignment procedure for review and approval, in the event that field alignment is required.
  3. Alignment shall be in conformance with manufacturer's written tolerance limits.
  4. Proper alignment of all components shall be confirmed by qualified, factory engineer. Submit factory engineer's certified statement verifying proper alignment.
- F. Install identifying labels permanently to equipment.
- G. Energize no equipment, except by manufacturer's serviceman, until authorized in writing.

### 3.2 WARRANTY

- A. The equipment manufacturer shall warrant all parts to be free from defective material and workmanship for a period of one (1) year after final acceptance, and shall furnish to the Owner replacement for any such items found to be defective by the Manufacturer.
- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 FIELD QUALITY CONTROL

- A. Functional Tests: Conduct on each piece of equipment in the system.
1. Vibration Test: System shall not develop amplitudes of vibration in excess of manufacturer's recommendations. Test with units installed and in normal operation.
- B. Performance Test: Conduct on each unit assisted by manufacturer's representative.
1. Perform under actual or approved simulated operating conditions.
  2. Test for without malfunction and in accordance with Section 01650.
  3. Perform with Engineer present.
  4. Adjust, realign, or modify units and retest.

### 3.4 MANUFACTURER'S SERVICES

- A. In accordance with Section 01730, Operation and Maintenance Data.

- B. Manufacturer's Representative: Present at Site or classroom designated by Owner, for minimum person-days listed below, travel time excluded:
  - 1. 1 person-day for installation assistance and inspection, or as required.
  - 2. 1 person-day for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation, or as required.
  - 3. 1 person-day for facility startup, or as required.
  - 4. 1 person-day for training of Owner's personnel.

### 3.5 SHOP PAINTING

- A. Both the inside and outside surfaces of all ferrous materials, equipment, and devices shall be thoroughly cleaned at the shop.
- B. All ferrous parts/components, except machine surfaces and others obviously not to be painted, and as otherwise specified hereinbefore (including referenced AWWA Standards), shall be furnished with primer coats of rust inhibitive primer compatible as specified in Division 9 – Finishes. Where applicable, surface preparation and primer coating shall be as specified in Division 9 – Finishes. All machined surfaces subject to corrosion shall be coated with a rust preventer/inhibitor prior to shipment. Contractor shall follow Manufacturer's recommendations for preventing corrosion prior to installation and operation.

### 3.6 PAINT

- A. Equipment shall be painted and stenciled in accordance with Division 9 – Finishes.

### 3.7 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 11371

## SECTION 11373

### FLOATING DECANTER

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

- 1. Backwash Waste Tank Recycle Decanters

- B. Related Sections include the following:

- 1. Division 1 – General Requirements

- 2. Division 9 – Finishes

- 3. Division 11 – Equipment

- 4. Division 13 – Special Construction

- 5. Division 16 – Electrical

##### 1.3 SYSTEM DESCRIPTION

- A. The Contractor shall furnish all labor, materials, equipment, and incidentals and install three (3) floating decanters and support systems to extract the supernatant from the backwash waste tanks.

- B. The pump manufacturer is responsible for ensuring that all equipment and systems required for a complete operating system are provided, and compatible and suitable for the project conditions.

- C. The equipment covered by these Specifications shall be standard equipment of proven ability as supplied by reputable suppliers having a long experience in the production of such equipment.

- D. Decanters are located in confined spaces, the backwash waste tanks.

#### 1.4 SUBMITTALS

- A. Submit the following in accordance with the Conditions of Contract and Division 1 Specification Sections.
  - 1. Submit shop drawing submittals for floating decanters shall contain valves, valve operators, strainers, hangers and supports, wall seals and sleeves, flexible connections, and other like manufactured items.
- B. Operation and Maintenance Manuals: Include manufacturer's instructions for equipment installation, start-up, operation, and maintenance, including parts lists for operation and maintenance manuals specified in Section 01730 – Operation and Maintenance Data.

#### 1.5 QUALITY ASSURANCE:

- A. Comply with applicable parts of Section 01400 – Quality Assurance.
- B. Consideration given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, and performance equal to that specified.
- C. Workmanship and Design
  - 1. All parts to be amply proportioned for long, continuous, and uninterrupted service. Provisions shall be made for easy lubrication, adjustment, or replacement of all parts. Corresponding parts of multiple units shall be inter-changeable.
  - 2. The design and proportioning of all parts shall provide liberal strength, stability, and stiffness, and be especially adapted for the application. Ample room and facility for inspection, repairs, and adjustments shall be provided.
  - 3. All materials used in the construction of equipment shall be of the best quality and shall be entirely suitable in every respect for the required service.
- D. Field Testing of Floating Decanters
  - 1. Field tests shall be performed by the Contractor under the instruction of the field service engineer.
  - 2. Ensure that all components perform as specified. The field tests shall be completed in coordination with the recycle pump tests.
  - 3. In the event that a decanter unit fails to pass a test, make all modifications required to place the unit in proper working order, and retest.
  - 4. In the event that a unit fails a test a second time, remove the unit and replace with a satisfactory one, at no cost to the owner.
  - 5. Submit all scheduling and procedures to the Engineer for approval.

6. Provide all instrumentation, equipment, and appurtenances, as well as any temporary wiring or piping, required to perform the tests.
7. Submit certification of successfully conducted field tests, including test results.

#### 1.6 OPERATIONS AND MAINTENANCE INSTRUCTION MANUALS

- A. Operation and Maintenance Manuals: Submit materials for inclusion in Operation and Maintenance Manuals specified in Section 01730 – Operation and Maintenance Data.
- B. Furnish Operation and Maintenance Instruction Manuals (O&M Manuals) prior to start-up.
- C. O&M manuals shall be prepared with clear instructions that will enable the Owner's personnel to operate and maintain all end suction pump systems.
- D. The manuals shall be prepared specifically for each installation. General literature from the equipment manufacturer that is not specifically applicable to the operation and maintenance of the installed items shall not be acceptable.
- E. The manuals shall be comprehensive and as a minimum contain:
  1. Description and operating instruction for all mechanical components.
  2. Instructions relevant to all modes of equipment operation.
  3. Service and trouble-shooting instructions of equipment supplied.
  4. Procedures for the adjustment of equipment at initial start-up, during routine preventative maintenance, and following replacement or repair.
  5. Instructions for testing and calibration of electronic components as may be required to determine proper performance.
  6. Detailed operating instructions for normal and emergency operation conditions.
  7. As-Built Mechanical drawings and dimensional information showing the actual layout and location of equipment components within the structures.

#### 1.7 EXTRA MATERIALS

- A. Furnish items expected to require replacement or to be consumed during normal operation within the first year of operation. Furnish one set of spare parts for each individual unit furnished and installed.

#### 1.8 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to concrete structures and insets required.

- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.

## 1.9 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01610 – Delivery, Storage, and Handling and as specified herein. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
- C. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.
- D. Store and safeguard equipment, material and spare parts.
- E. Grease coat all exposed ferrous surface prior to shipping, to prevent corrosion during on site storage.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. Three (3) floating decanters (DF-835A, DF-835B, DF-835C) shall be provided.
- B. Decanter manufacturer acts as a single source for all components and shall accept complete product responsibility.
- C. Manufacturers
  - 1. Pureflow (<https://waterbypureflow.com/>) Whittier, CA
  - 2. Fluidyne (<http://www.fluidynecorp.com/>) Cedar Falls, IA
  - 3. Engineer Approved Equal.
- D. Drawings and specifications indicate general arrangement and layout based on decanter equipment supplied by Pureflow Model PFD-18G-8.5-4. If the equipment accepted requires arrangement, dimensions, or design that differs from that indicated or specified, or additional equipment not specified, any costs for modifications required are to be borne by the Contractor.
- E. The equipment covered by these specifications is intended to be of proven ability as manufactured by reputable concerns having long experience in the production of such equipment. The equipment furnished shall be designed and constructed in accordance with the best practice and methods.

- F. All components of the equipment shall be engineered for long, continuous, and uninterrupted service. Provisions shall be made for easy lubrication, adjustment, or replacement of all parts. Corresponding parts of multiple units shall be interchangeable.
- G. Provide anchor bolts under this section in conformance with requirements specified elsewhere. Anchor bolts shall be sized for a minimum base slab embedment of 6”.
- H. Structural steel components where requires shall be in conformance with ASTM Designation A36 and A53.
- I. Shop painting, field painting, and protective coatings are required as specified in Division 9 – Finishes.

## 2.2 FLOATING DECANTER (DF-835A, DF-835B, DF-835C) REQUIREMENTS

- A. The floating decanter system shall be suitable for potable water use.
- B. The floating suction assembly shall be designed and constructed so that the hose connection can swivel through 180 degrees without causing the float to overturn. During operation, the unit shall be self-righting if turned over, and capable of functioning as constructed without the addition of field attached weights.
- C. If the water is above the recycle pump shut-off point, the floating suction assembly shall be constructed in such a manner that regardless of water level, or hose position, the suction inlet will not break suction, either by turning on its side, pulsating, or vortexing at the suction inlet.
- D. The suction pipe assembly shall vent air when the suction pipe is above the horizontal on the floating suction assembly end.
- E. The floating suction assembly shall be a welded PVC enclosure, foam-filled, sized to pass through a 24” hatchway. The suction invert tee shall have 180-degree travel. There shall be two suction locations to provide reduced invert suction velocity. Each suction invert shall have a stainless-steel vortex breaker.
- F. The floating suction assembly shall have 316 stainless steel legs with non-metallic caps to prevent damage to the tank floor.
- G. If a tethering is a sight requirement, a top-mounted eyebolt shall be included on the floating suction assembly to allow for tethering or for float retrieval without draining the reclaim tank.
- H. The suction pipe shall be schedule 80 PVC connected at the tank end with a metal helix reinforced flexible PVC hose-joint of sufficient length to allow for a ninety-degree bend radius from horizontal to a vertical position, change of direction, without the reinforcement being unduly stressed or distorted.
- I. The suction assembly shall have a pipe size of 4”.
- J. Basic components supplied:

1. Float
  2. Stainless steel vortex breakers
  3. Dual suction invert
  4. Suction pipe schedule 80 NSF/ANSI 61
  5. Suction flex hose joint
  6. Tank connection Schedule 80 PVC flange adapter with 125# pattern
  7. Four power-clamps to make up hose connections.
- K. All floating suction parts in contact with the water shall be constructed from NSF / ANSI 61 compliant components.

### 2.3 SPECIAL TOOLS AND SPARE PARTS

- A. Refer to Section 01730 – Operation and Maintenance Data.
- B. Provide one complete set of all special tools required for maintenance of the decanting units.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Install floating decanters and related appurtenances according to the manufacturer's printed instructions, as indicated and specified.
- B. Disinfect or flush decanters in accordance with manufacturer's printed instructions, as indicated and specified.
- C. All equipment shall be field tested in accordance with this Section of the Specifications.
- D. Equipment failing to meet specific conditions shall be removed and replaced at no additional cost to the Owner.
- E. Energize no equipment except by manufacturer's factory service representative, until authorized in writing.

### 3.2 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.

- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 CLEANING

- A. After installation is complete and piping connections made, clean decanters in accordance with manufacturer's recommendations. Remove all debris from piping systems prior to cleaning decanters.

### 3.4 SHOP PAINTING

- A. Both the inside and outside surfaces of all ferrous materials, equipment, and devices shall be thoroughly cleaned at the shop.
- B. All ferrous parts/components, except machine surfaces and others obviously not to be painted, and as otherwise specified hereinbefore (including referenced AWWA Standards), shall be furnished with primer coats of rust inhibitive primer compatible as specified in Division 9 – Finishes. Where applicable, surface preparation and primer coating shall be as specified in Division 9 – Finishes. All machined surfaces subject to corrosion shall be coated with a rust preventer/inhibitor prior to shipment. Contractor shall follow Manufacturer's recommendations for preventing corrosion prior to installation and operation.

### 3.5 FIELD PAINTING

- A. Equipment shall be painted and stenciled in accordance with Division 9.

### 3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 11373

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 11377

### ROTARY POSITIVE DISPLACEMENT BLOWER

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. Furnish, install, and field test package blower system, including, but not limited to, blowers, motors, noise enclosure, drives, guards, drive couplings, baseplates, vibration isolators, supports, silencers, relief valves, flexible connectors, spare parts, outside air filter, and miscellaneous appurtenances as necessary for a complete installation as indicated on the drawings and herein specified.
- B. All items herein specified and related items shall be provided by the blower manufacturer as selected by the Filter Manufacturer in accordance with Section 11201 – Iron and Manganese Removal System. The Blower Manufacturer is responsible for ensuring that all equipment required is provided, and that it is compatible and suitable for the application.
- C. The specifications and drawings adequately describe the system, but do not purport to cover all required details. Provide all appurtenances required, whether specifically noted herein or not, at no additional cost to the owner.
- D. Blowers shall be constructed with appropriate materials for continuous service suitable for drinking water. The Blower Manufacturer shall be responsible for supplying the complete unit as defined and shall assume complete unit responsibility.
- E. Related Sections include the following:
  - 1. Division 1 – General Requirements
  - 2. Division 9 – Finishes
  - 3. Division 11 – Equipment
  - 4. Division 13 – Special Construction
  - 5. Division 16 – Electrical

##### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein:

1. Complete list of system components to be provided.
2. Make, model, weight, and horsepower of each equipment assembly.
3. Complete catalog information, descriptive literature, specifications, and identification of materials of construction.
4. Standard and specialized equipment assembly cuts.
5. System layout, installation, and placing drawings for equipment, drivers, and bases.
6. Performance data for each type of equipment that will show compliance with specification requirements stated herein.
7. Horsepower demand over the operating range of the blower.
8. Detailed structural, mechanical, and electrical drawings showing the equipment fabrications and interface with other items. Include dimensions, size, and locations of connections to other work.
9. Sound Enclosure: Complete description of sound enclosure and accessories, and calculated noise attenuation.
10. Routine maintenance requirements prior to plant startup.
11. Test Reports: Factory test reports for blower and motor. Field test procedures and inspection reports. Test report for slip test and noise certified readings.
12. Shop drawing data for accessory items.
13. Operating and maintenance instructions and parts lists.
14. Shop Manuals.
15. Motor shop test results.
16. Recommendations for short- and long-term storage.
17. Samples: Color samples for finish coating. If paint manufacturer of finish coat differs from manufacturer of prime coat, provide both manufacturers' written confirmation that materials are compatible.

#### 1.4 QUALITY ASSURANCE

- A. Provide in accordance with Section 01400 – Quality Assurance and as specified.
- B. To be considered “or equal”, the blower shall be a standard product in regular production by a single blower manufacturer who shall have five years minimum, successful experience in the production of equipment specified herein. The

manufacturer shall have also satisfactorily furnished ten units of the type described herein within the last five years.

- C. The blower and equipment specified shall be standard equipment and totally suited for the application as detailed herein. The equipment to be furnished shall be satisfactory and safely designed, in accordance with the design parameters as detailed in these contract documents. It shall be constructed for continuous, automatic operation, for extended periods.
- D. When two or more units of a specific type of equipment are to be provided, they shall be the product of a single manufacturer. Multiple units and their parts shall be identical and interchangeable to the greatest extent possible.
- E. All items shall be designed and constructed in full accordance with all applicable state and local codes and regulations. Labor, materials, and costs required to meet state codes shall be the responsibility of the Contractor and the equipment supplier.
- F. Blower manufacturer must provide the blowers and motors, regardless of manufacturer, as a complete and integrated package to ensure proper coordination and compatibility of equipment.
- G. Shop tests as hereinafter specified.
- H. Services of Manufacturer's Representative as specified herein.
- I. Provide services of factory-trained Service Engineer, specifically trained on type of equipment specified:
  - 1. Submit qualifications of Service Engineer for approval.
  - 2. Person-day requirements listed exclusive of travel time, and do not relieve Contractor of obligation to provide sufficient service to place equipment in satisfactory operation.
  - 3. Installation: Sufficient time to assist in location of anchor bolts; setting, leveling, alignment, field erection, etc.; coordination of piping, electrical, miscellaneous utility connections, but not less than:
    - i. 1 day
  - 4. Start-up: Sufficient time for calibration, testing, and start-up, but not less than:
    - i. 1 day
  - 5. Instruction: Sufficient time for classroom and/or field operation and maintenance instruction, but not less than:
    - i. ½ day

6. Instruction shall be scheduled separately from installation checkout and acceptance testing, unless approved by the Engineer.
7. Performance Testing: Sufficient time for field performance testing, but not less than:
  - i. ½ day
8. Credit to the Owner unused service person-days specified above, at the manufacturer's published field service rate plus travel costs.

## 1.5 OPERATION AND MAINTENANCE INSTRUCTION MANUALS

- A. Operation and Maintenance Manuals: Submit materials for inclusion in Operation and Maintenance Manuals specified in Section 01730 – Operation and Maintenance Data.
- B. Furnish Operation and Maintenance Instruction Manuals (O&M Manuals) prior to start-up for each blower supplied.
- C. O&M manuals shall be prepared with clear instructions that will enable the Owner's personnel to operate and maintain the blowers and all equipment associated with each blower.
- D. The manuals shall be prepared specifically for each installation. General literature from the equipment manufacturer that is not specifically applicable to the operation and maintenance of the installed items shall not be acceptable.
- E. The manuals shall be comprehensive and as a minimum contain:
  1. Description and operating instruction for each blower.
  2. Instructions relevant to all modes of equipment operation.
  3. Service and trouble-shooting instructions as may be available from select manufacturers of equipment supplied.
  4. Procedures for the adjustment of equipment at initial start-up, during routine preventative maintenance, and following replacement or repair.
  5. Instructions for testing and calibration of electronic components as may be required to determine proper performance.
  6. As-Built Mechanical drawings and dimensional information showing the actual layout and location of blower equipment components within the structures.

## 1.6 SPARE PARTS

- A. Furnish, tag, and box for shipment and storage the following spare parts:

<u>Item</u>	<u>Quantity</u>
Oil, synthetic	Enough for one year of service
Intake Filters	Three filters
Flexible Coupling	One complete set per unit
Drive V-Belts	One complete set per unit
Special tools required to maintain or dismantle	One complete set for each unit

## 1.7 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to instrumentation, electrical, and concrete structures and insets required.
- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.

## 1.8 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01610 – Delivery, Storage, and Handling and as specified herein. Ship equipment, material and spare parts complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
- C. Deliver spare parts at same time as pertaining equipment. Deliver to Owner after completion of work.
- D. Store and safeguard equipment, material and spare parts.
- E. Grease coat all exposed ferrous surface prior to shipping, to prevent corrosion during on site storage.

## PART 2 – PRODUCTS

### 2.1 EQUIPMENT SUPPLIER

- A. The Blower Manufacturer shall act as a single source for all components and shall accept entire system responsibility.
- B. The equipment covered by these specifications shall be standard equipment of proven ability as supplied by reputable suppliers having a long experience in the production of such equipment.
- C. Available Suppliers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to, the following:

1. Dresser Roots (<http://www.rootsblower.com/>)
2. Kaeser Compressors, Inc. (<http://us.kaeser.com/>)
3. Gardner-Denver, Inc. (<http://www.gardnerdenver.com/>)

Note: The blower contract drawings are based upon Roots 22 URAI Universal blower package unit. Any proposed “OR EQUAL” blower suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

## 2.2 DESIGN REQUIREMENTS

### A. General.

1. Design equipment with due regard to safety of operation, accessibility, and durability of parts, and complying with applicable OSHA, state, and local safety regulations.
2. The blower will receive outside air from a dedicated filter and discharge into a separate discharge line.
3. Intermittent and continuous operation in an indoor environment.
4. Maximum Sound Pressure Level: 80 dBA, factory calculated, with inlet and discharge silencers, measured with a sound enclosure.

B. Performance requirements are listed in the Mechanical Schedule of the Drawings. Additional design requirements are listed in the table below:

Design Capacity, scfm	31
Design Capacity, acfm @ 100 degrees F and 100% RH	40
Altitude, mean sea level	162
Barometric pressure, psia	14.6
Inlet pressure at compressor inlet flange, psia	13.9
Inlet air temperature range, degrees F	-10 to 110
Relative humidity, %	0 to 100
Discharge pressure at compressor discharge flange, psia	19.9
Blower pressure rise required, psig	5
Pressure relief valve setting, psig	6

## 2.3 BLOWER

- A. Rotary positive displacement type, belt driven by horizontal electric motor.
- B. Casing: One-piece construction, ASTM A48, Class 30B close-grain cast iron strongly ribbed to prevent distortion at the specified operating conditions. Separate headplates of cast iron.
- C. Bearings: Each shaft and impeller assembly shall be supported by bearings sized for a minimum L10 rating of 100,000 hours. Drive end bearings shall be fixed to control axial location of impeller assembly. Bearings and gears shall be lubricated by a splash type lubrication system on both ends of the rotors. Provide each bearing with a positive lip type oil seal designed to prevent lubricant from entering air stream and a labyrinth seal on each shaft designed to reduce air leakage at point where shaft extends through headplate of blower casing. Make further provision to vent area between the two sealing systems to atmosphere to relieve excessive pressure on seals.
- D. Impellers: Each impeller/shaft assembly integrally cast from high-strength ASTM A395 Type 60-45-15 ductile iron. Straight, two-lobe involute type, rotating in opposite directions in a common casing without rubbing, liquid seals, or lubrication. Positioned by timing gears to maintain proper clearances. Impellers and timing gears shall be mounted on shafts supported by antifriction bearings, fixed to control the axial location of impeller/shaft in the casing.
- E. Shafts: The blower shafts shall be ASTM A322, Class B, Grade SAE 1144 or equal. The shafts shall be pressed through the impeller body with an interference fit, and pinned in place.
- F. Belt Drive: V-belt drive with automatic belt tension device. Minimum service factor of 1.4. Designed not to exceed allowable overhung load limits of blower and motor. Provide belt guard with acoustical treatment.

## 2.4 MOTOR

- A. The motor shall be sized for appropriate horsepower, RPM, and other electrical characteristics as determined for the application. The brake horsepower requirement with relief valve fully open shall not exceed the motor nameplate horsepower rating with service factor. Motors to be horizontal foot mounted, ball bearings, heavy-duty steel or cast iron frame, gasketed conduit boxes, and manufactured to NEMA or IP standards.
- B. Motor shall be squirrel-cage induction type with TEFC enclosure, and motor shall be premium efficiency with a 1.15 service factor.
- C. Factory mount blower and motor as a package.

## 2.5 ACCESSORIES

- A. Provide vibration isolators to limit transmission of vibration to anchor points at floor.

- B. Baseplate: Cast iron or fabricated steel mounted on concrete equipment pad as shown on Drawings.
- C. Support Stand: Designed by manufacturer and shall be reinforced to withstand anticipated loadings and vibration of blower, motor, inlet silencers, and associated piping.
- D. The drive guard shall be the manufacturer's standard sheet metal with provision for ventilation. The installed guard shall be fully enclosed, easily removable, and designed to meet current OSHA recommendations and CE standards.
- E. Intake filters shall be the type suitable for exterior service and direct mounting at the end of the air piping. The filter element shall be the cartridge type fabricated from a pleated paper media with an efficiency of 99 percent on 10 micron particles. The housing shall be designed to withstand a full vacuum of 15 psig. The rated capacity of the filter shall be a minimum of 150 scfm with a clean maximum pressure drop of 2 inches of water column (WC). End connections shall be 125-pound steel flanges.
- F. The silencers shall be of the absorptive type, directly connected to the inlet/outlet ports of the blower, and shall be mounted horizontally. Silencers shall be designed to reduce pulsation from rotary lobe blowers at blower operating timing gear speed. Silencer shall be designed for anticipated operating temperatures. Pressure loss shall not exceed 6 inches of WC maximum, through each silencer at the design flow rate. Provide drain coupling and plug.
- G. Check Valve: Wafer type for each blower; installed in blower discharge piping downstream of relief valve. Cast iron body, stainless steel pin and spring, and two semicircular cast iron or aluminum plates. Seat shall be Viton or Silicone for high temperature operation. Elastomeric hinges will not be allowed. The blower manufacturer must ensure the valve is suitable for the application.
- H. Safety Relief Valve: Flanged, spring type. Cast iron weighted nonvibrating type with flanged connection. Sized to relieve entire discharge flow without overloading blower. Rated at operating temperatures of 300 degrees F. Furnish one for each blower on discharge piping. Design pressure for relief shall be 7 psig. Safety Relief Valve shall be as manufactured by: TEC, Inc. Model: SWL1199 or Engineer Approved Equal.
- I. Noise Enclosure: Total noise enclosure to provide 80 dBA average noise level at one meter. Material shall be at least 2 inches thick of galvanized material. Noise enclosure shall have removable panels for blower access and inspection. The sound enclosure shall be sheet steel construction with powder coat finish.
- J. The blower package shall be capable of being installed directly adjacent to another blower package of similar design and shall be capable of mounting next to the wall without maintenance interference.

- K. The blower package shall include pressure/vacuum gauges, each with a throttle plug on both the suction and discharge of the blower. Gauges shall be mounted on the noise enclosure.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Install package blower systems and related appurtenances according to the manufacturer's printed instructions, as indicated and specified.
- B. All equipment shall be field tested in accordance with this Section of the Specifications.
- C. Equipment failing to meet specific conditions shall be removed and replaced at no additional cost to the Owner.
- D. Install identifying labels permanently to equipment.
- E. Energize no equipment except by blower manufacturer's service representative, until authorized in writing.
- F. Handle all coated ferrous items with canvas or nylon slings or other suitable methods to avoid damaging the coating.
- G. Install blower package on vibration isolators in strict accordance with manufacturer's written instructions.

### 3.2 WARRANTY

- A. The complete system shall be warranted free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.
- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 FACTORY TEST REQUIREMENTS

- A. The rotating parts of each blower provided by the manufacturer shall be statically and dynamically balanced before final assembly. The blower alone shall operate without excessive vibration. Removal of material from the face of the rotors for balancing purposes is not allowed.

- B. Each blower provided by the manufacturer shall be slip tested. A 1 PSI slip test shall be performed on each blower to verify flow and horsepower. The slip RPM shall be documented. A document certifying that the supplied blowers conform to the design specifications shall be provided.
- C. On completion of final assembly of the packaged blower and prior to shipment, each packaged blower shall be mechanically run for a minimum of fifteen (15) minutes. A document certifying that the supplied blowers conform to the design specifications shall be provided.
- D. Provide package noise certified readings which includes the mechanical run test and calculated to a free field environment. Test to be measured to CAGI-PNEUROP test code with +/- 3 dBA tolerance. Blower manufacture's certification shall be provided.
- E. Motor Tests:
  - 1. Give each motor the standard commercial tests in the shop of the motor manufacturer, and submit certified copies of the test results to the Engineer for review prior to installation of the motors.
- F. In the event that the blower package fails to perform as specified during the test, make all modifications required to place the unit in conformance with the specifications, and retest, at no additional cost to the Owner.
- G. In the event that the blower package fails a second test, the unit will be rejected without recourse, and must be replaced with a unit equal to that specified, which passes the required tests.
- H. Submission of Test Results: All data shall be submitted on 8-1/2 x 11 inch sheets at as large a scale as is practical.

### 3.4 FIELD TEST AND QUALITY CONTROL

- A. Each blower package shall be completely assembled in the Blower Manufacturer's facility and the blowers shall be subjected to a complete operational performance test. Individually test each blower package. Certify that the blower package is free from overheating and excessive vibration. Plot curves for all performance data. A copy of the test report will be submitted to the Engineer prior to startup. Additional requirements specified herein.
- B. The Contractor shall have the Blower Manufacturer factory service representative present during field installation. It shall be the Contractor's responsibility to obtain the recommended installation procedures directly from the Manufacturer, and comply with same.
- C. Contractor shall have the Blower Manufacturer provide a factory service representative who has complete knowledge of the operation of the packaged blower system, including mechanical, electrical, control, and alarm components as necessary to perform field testing and initial start-up to assure and demonstrate the proper performance of all equipment and blower components.

- D. Field tests shall be performed by the Contractor under the instruction of the Blower Manufacturer's field service engineer. All field testing to be witnessed by the Engineer in the field. Provide notice of field testing in accordance with 01650 – Facility Start-up/Commissioning. Submit all scheduling and procedures to the Engineer for approval. Provide written test procedures which describe the proposed means and methods to be used in conducting necessary field tests. Submit certification of successfully conducted field tests.
- E. Check on each blower system, assisted by manufacturer's service representative, for correct rotation, proper alignment and connection, quiet operation, vibration, and satisfactory specified performance in meeting design requirements. Complete mechanical and flow test, record the following data: Inlet and outlet air pressure, inlet and outlet air temperature, discharge flow, motor voltage and amperage for each phase, horsepower. Measure power consumption using a calibrated wattmeter.
- F. In the event that a unit fails to pass a test, make all modifications required to place the unit in proper working order.
- G. In the event that a unit fails a test a second time, remove the unit and replace with a satisfactory one, at no cost to the Owner.
- H. The Contractor shall provide all necessary instrumentation, equipment, devices, and appurtenances, as well as temporary wiring or piping, required to perform field tests.

### 3.5 SHOP PAINTING

- A. Both the inside and outside surfaces of all ferrous materials, equipment, and devices shall be thoroughly cleaned at the shop.
- B. All ferrous parts/components, except machine surfaces and others obviously not to be painted, and as otherwise specified hereinbefore (including referenced AWWA Standards), shall be furnished with primer coats of rust inhibitive primer compatible as specified in Division 9 – Finishes. Where applicable, surface preparation and primer coating shall be as specified in Division 9 – Finishes. All machined surfaces subject to corrosion shall be coated with a rust preventer/inhibitor prior to shipment. Contractor shall follow Manufacturer's recommendations for preventing corrosion prior to installation and operation.

### 3.6 PAINT

- A. Equipment shall be painted and stenciled in accordance with Division 9 – Finishes

### 3.7 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 - Contract Closeout.

END OF SECTION 11377

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

SECTION 11501  
PROCESS GAUGES

PART 1 – GENERAL

1.1 SUMMARY OF WORK

- A. The Contractor shall furnish process gauges where shown on the Contract Drawings and as specified herein.
- B. The Contractor shall be responsible for delivery and unloading of the process gauges system as noted below.
- C. All required labor, materials, and equipment shall be included.
- D. Related Sections include the following:
  - 1. Division 1 – General Requirements
  - 2. Division 11 – Equipment
  - 3. Division 13 – Special Construction

1.2 QUALITY ASSURANCE

- A. Provide in accordance with Section 01400 – Quality Assurance and as specified.
- B. Each component shall be designed for the environmental conditions of the space in which the component is located.
- C. Indoor areas will be climate controlled. Temperatures in the equipment areas will be between 75 and 55 degrees F, and a relative humidity may be as high as 60 percent.

1.3 SUBMITTALS

- A. The Contractor shall submit shop drawings for all components of the pressure gauges in accordance Division 1.

1.4 COORDINATION

- A. Contractor shall coordinate with PFAS Removal and Iron and Manganese Removal pressure filter vendors to assure all process gauges are the product of the same manufacturer.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

- A. The available manufacturers are:

1. AMETEK, Inc.; U.S. Gauge Div. (<https://webshop.ametekusg.com/>).
2. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div. (<http://www.ashcroft.com/>).
3. H. O. Trerice Co. (<http://www.trerice.com/>).
4. WIKA Instrument Corporation (<https://www.wika.us/>).
5. Engineer Approved Equal.

## 2.2 DIRECT MOUNTING, DIAL TYPE PRESSURE GAUGES

- A. All pressure gauges shall be of the indicating-dial type in accordance with ASME Designation B40.100.
1. The case shall be of the liquid-filled type, drawn steel or cast aluminum, 4-1/2 inches in diameter.
  2. The pressure-element assembly shall be of the Bourdon tube, unless otherwise indicated.
  3. The pressure connection shall be brass, NPS 1/4, bottom-outlet type unless the back-outlet type is indicated.
  4. The movement shall be mechanical with a link to the pressure element and connection to pointer.
  5. The dial shall be satin-faced, non-reflective aluminum with permanently etched scale markings.
  6. The pointer shall be red metal.
  7. The window shall be glass.
  8. The ring shall be metal.
  9. The accuracy shall be Grade A, plus or minus one (1) percent of middle half scale.
  10. The vacuum-pressure range shall be 30-inches of mercury of vacuum to 15 psig of pressure.
  11. The range for fluids under pressure shall be two (2) times the operating pressure.
  12. Provide diaphragm seals for liquid piping to prevent the gauge from being clogged or corroded by process materials.

## 2.3 REMOTE MOUNTING, DIAL TYPE PRESSURE GAUGES

- A. All pressure gauges shall be of the indicating-dial type in accordance with ASME Designation B40.100.
1. The case shall be of the dry type, drawn steel or cast aluminum, 4-1/2 inches in diameter, with holes or something else for panel mounting.
  2. The pressure-element assembly shall be of the Bourdon tube, unless otherwise indicated.
  3. The pressure connection shall be brass, NPS 1/4, bottom-outlet type unless the back-outlet type is indicated.
  4. The movement shall be mechanical with a link to the pressure element and connection to pointer.
  5. The dial shall be satin-faced, non-reflective aluminum with permanently etched scale markings.
  6. The pointer shall be red metal.
  7. The window shall be glass.
  8. The ring shall be metal.
  9. The accuracy shall be Grade A, plus or minus one (1) percent of middle half scale.
  10. The vacuum-pressure range shall be 30-inches of mercury of vacuum to 15 psig of pressure.
  11. The range for fluids under pressure shall be two (2) times the operating pressure.
  12. Provide diaphragm seals for liquid piping to prevent the gauge from being clogged or corroded by process materials.

## 2.4 PRESSURE-GAUGE FITTINGS

- A. The valves shall be NPS 1/2" or 1/4" brass or stainless steel ball valve.
- B. The snubbers shall be in accordance with ASME Designation B40.5, NPS 1/4 brass bushing with corrosion resistant, porous metal disc of material suitable for system fluid and working pressure.

## PART 3 – EXECUTION

### 3.1 GAUGE APPLICATIONS

- A. The Contractor shall furnish pressure gauges for discharge of each blower.
- B. The Contractor shall furnish and install pressure gauges at the suction and discharge of each pump.

- C. The Contractor shall furnish and install pressure gauges where noted on the Contract Drawings and as specified in other sections.

### 3.2 INSTALLATION

- A. The Contractor shall furnish ball valves and snubber fitting in the piping for each pressure gauge in accordance with the Manufacturer's written instructions, Drawings, and as specified herein.
- B. The Contractor shall provide diaphragm protection seal protection for all chemical feed system and residuals/backwash waste applications.

### 3.3 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 11501

DIVISION 12 – FURNISHINGS

12350	.....	Laboratory Casework
12500	.....	Window Treatments

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 12350

### LABORATORY CASEWORK

#### PART 1 - GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Laboratory casework standing base cabinet.
2. Laboratory casework standing base cabinet with drawers.
3. Molded epoxy resin laboratory base cabinet worktop, backsplash, sink and sink outlet.
4. Wall mounted, glass fronted laboratory casework storage cabinet.
5. Accessories and appurtenances as required for complete installation of laboratory casework.

- B. Related Sections:

1. Division 0 – Bidding and Contract Requirements.
2. Division 1 – General Requirements.
3. Section 07920 “Joint Sealants”, for sealing joint between laboratory casework and adjacent wall.
4. Division 15 Sections for plumbing work at laboratory casework sinks.
5. Division 15 Sections for fume hood.

##### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of the Contract and Division 1 Specification Sections and as specified herein.

- B. Product Data: Full information on all laboratory casework items, including materials of construction, dimensions, hardware and all other features, together with a complete schedule of laboratory casework to be provided.

- C. Samples: 12 in. x 12 in. sample of laboratory casework wood cabinet material and 6 in. x 6 in. sample of 1 in thick worktop.
- D. Cleaning and Maintenance Information: Manufacturer's laboratory casework cleaning and maintenance instructions.

#### 1.4 QUALITY ASSURANCE

- A. Obtain all laboratory casework from a single supplier and single manufacturer.
- B. The materials, products, devices, methods, systems, design and installation of any and all aspects of the plumbing systems, including the laboratory casework sink and appurtenances, shall be in conformance with 248 CMR 3.00 through 10.00, including the provision that all products used in any plumbing system shall be Product-Approved by the Plumbing Board.

#### 1.5 WARRANTY

- A. Provide manufacturer's standard warranty for all laboratory casework items, including defects such as hardware failures, delamination or warping of wood cabinets, deterioration of molded epoxy resin and other material failures.
- B. Warranty to include repair or replacement, as appropriate, of failed or defective laboratory casework materials and items at no cost to the Owner for the full length of warranty period.

#### 1.6 COORDINATION

- A. Coordinate laboratory casework with Plumbing work and HVAC work (fume hood).

### PART 2 - PRODUCTS

#### 2.1 LABORATORY CASEWORK

- A. Cabinets, Worktop, Sink and Other Items:
  - 1. Wood base cabinets and wall cabinets with doors, drawers and shelves as shown and listed on the Drawings.
  - 2. Worktop: 1 in. thick molded epoxy resin countertop with sink cutout, epoxy resin backsplash, tub sink and sink outlet. [Note: Worktop shall be compatible with potassium hydroxide (45%), sodium hypochlorite (12.5%), and polyaluminum chloride (33%).]
  - 3. Wall mounted, glass fronted laboratory casework storage cabinet.
  - 4. Accessories and appurtenances as required for complete installation of laboratory casework.

- B. Wood Cabinet Finish: Golden Oak.
- C. Acceptable Manufacturers:
  - 1. Kewaunee Scientific Corporation.
  - 2. Fisher Scientific.
  - 3. Labconco Corporation.
  - 4. Or approved equal.
- D. Casework Listing: Casework identified on the Drawings is based on Kewaunee Scientific Corporation catalog numbers. Listing on the Drawings is solely to establish the sizes, features and other characteristics of the laboratory casework items. Casework items by other manufacturers with the same size, features and other characteristics as the listed items will be acceptable.

### PART 3 - EXECUTION

#### 3.1 EXAMINATION

- A. Examine location for installation of laboratory casework for suitability to proper installation.
- B. If unsatisfactory conditions are found, notify Engineer and General Contractor for correction of unsatisfactory conditions.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.2 INSTALLATION

- A. Install all laboratory casework in strict accord with manufacturer's written recommendations.
- B. Install all casework level and true and securely mount wall-hung unit.
- C. Coordinate work at sink with Plumbing Contractor.
- D. Coordinate installation of casework with installation of joint sealants.

#### 3.3 PROTECTION AND CLEANING

- A. After completion of casework installation, provide protective covers for all casework to prevent damage from other construction work.
- B. Repair or replace, as needed, any casework damaged by other construction work at no cost to the Owner.
- C. Clean all casework as part of Closeout work.

3.4 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Project Closeout.

END OF SECTION 12350

## SECTION 12500

### WINDOW TREATMENTS

#### PART 1 - GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:
  - 1. Horizontal louver blinds for windows indicated.
- B. Related Sections include the following:
  - 1. Division 0 – Bidding and Contract Requirements.
  - 2. Division 1 – General Requirements.

##### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of the Contract and Division 1 Specification Sections and as specified herein.
- B. Product Data: For each type of product indicated.
- C. Shop Drawings: Show fabrication and installation details for horizontal louver blinds.
- D. Samples for Initial Selection: For each type and color of horizontal louver blind indicated.
  - 1. Include similar Samples of accessories involving color selection.
- E. Samples for Verification: For each type and color of horizontal louver blind indicated.
  - 1. Slat: Not less than 12 inches long.
  - 2. Blind: One full functional unit, 16-inches wide by 24-inches long.
- F. Product Certificates: For each type of horizontal louver blind, signed by product manufacturer.

G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each type of horizontal louver blind.

H. Maintenance Data: For horizontal louver blinds to include in maintenance manuals.

#### 1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain horizontal louver blinds through one source from a single manufacturer.

B. Fire-Test-Response Characteristics: Provide horizontal louver blinds with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.

1. Flame-Resistance Ratings: Passes NFPA 701.

C. Product Standard: Provide horizontal louver blinds complying with WCSC A 100.1.

D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver horizontal louver blinds in factory packages, marked with manufacturer and product name, fire-test-response characteristics, and location of installation using same designations indicated on Drawings and in a window treatment schedule.

#### 1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not install horizontal louver blinds until construction and wet and dirty finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Field Measurements: Where horizontal louver blinds are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operable glazed units' operation hardware throughout the entire operating range. Notify Engineer of discrepancies. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

## PART 2 - PRODUCTS

### 2.1 HORIZONTAL LOUVER BLINDS, ALUMINUM SLATS

- A. Basis of Design Product: Subject to compliance with requirements, provide **SWFContract; Classics 1” Mini Blinds** or one of the following:
1. Hunter Douglas; Lightlines.
  2. Levolor; Riviera.
- B. Slats: Aluminum; alloy and temper recommended by producer for type of use and finish indicated; with crowned profile.
1. Width: 1 inch (0.991- inch actual).
    - i. Spacing: Not less than 0.85 inch (21.5 mm).
  2. Thickness: Not less than 0.008 inch.
  3. Finish: One color.
    - i. Ionized Coating: Antistatic, dust-repellent, baked polyester finish.
- C. Headrail: Formed steel channel, “U”-shaped; long edges returned or rolled; fully enclosing operating mechanisms on three sides and the following:
1. Capacity: One blind per headrail.
  2. Size: 1-inch high by 1-1/2- inch deep, 0.025 inch thick.
  3. Provide steel end stiffeners at each end of headrail with a lateral adjustment tab to eliminate lateral movement and the center the blind in the window.
  4. Hardware: Acetal low friction thermoplastic, mechanically locked into head channel by means of snap-in fittings with no mechanical cleats visible from underside of headrail.
  5. Finish: Prime coat of vinyl primer with finish coat of polyester baked enamel, to match bottom rail and end support brackets.
- D. Bottom Rail: Formed-steel tube 0.025-inch-thick, with plastic or metal capped ends, top contoured to match crowned shape of slat; with enclosed ladders and tapes to prevent contact with sill; and locking groove to receive dust cover.
1. Finish: Prime coat of vinyl primer with finish coat of polyester baked enamel.

- E. Ladders: Braided string; 100% high tenacity polyester yarn, not less than 0.045- inch diameter or greater than 0.066- inch diameter.
  - 1. Spacing: Distance between end ladder and end of slats not to exceed 6-1/2 inches; distance between ladders not to exceed 24 inches.
  - 2. Ladder drum: Injection molded thermoplastic with smooth hole edges to position ladder. Secure ladder with a snap down top, eliminating the need for braided ladder clips.
- F. Tilt Control: Enclosed worm-gear mechanism, slip clutch or detachable wand preventing overrotation, and linkage rod, and the following:
  - 1. Tilt Operation: Manual.
  - 2. Wand: Detachable, clear polycarbonate hollow rod with a hexagonal shape measuring approximately 1/4- inch across.
  - 3. Length of Tilt Control: Length required to make operation convenient from floor level.
  - 4. Tilt: Full.
  - 5. Tilt Rod: Electro-zinc coated solid steel, hexagonal in shape, 1/4-inch at its widest point. Tilt rod to limit torsional deflection to 6 degrees in a 30-inch test length with a torque application of one-foot pound.
  - 6. Tilt Rod Support: Acetal low friction thermoplastic, to provide smooth bearing and center the ladder drum over ladder hole. Incorporate a grommet guide to guide lift cord and braided ladder through bottom of headrail. Provide acetal grommet with beveled edges to prevent cord and braided ladder wear and discoloration.
- G. Lift Operation: Manual, cord lock; locks pull cord to stop blind at any position in ascending or descending travel.
  - 1. Cord Lock: Snap-in design which incorporates a stainless steel wear guard over which cords pass, and a floating shaft-type locking pin. Locking pin shall be free of abrasive teeth and offer minimum wear to cord. Incorporate a crash-proof safety feature which will lock blind automatically upon release of cord.
  - 2. Cord Guide: Nickel steel plated.
- H. Tilt-Control and Cord-Lock Position: Right and left side of headrail, respectively.
- I. Mounting: Wall or ceiling mounting as required, permitting easy removal and replacement without damaging blind or adjacent surfaces and finishes; with spacers and shims required for blind placement and alignment indicated.

1. Provide intermediate support brackets if end support spacing exceeds spacing recommended by manufacturer for weight and size of blind, but not more than 48-inches.
- J. Hold-Down Brackets and Hooks or Pins: Manufacturer's standard; provide at locations indicated.
- K. Colors, Textures, Patterns, and Gloss: As selected by Owner from manufacturer's full range.

## 2.2 HORIZONTAL LOUVER BLIND FABRICATION

- A. Concealed Components: Noncorrodible or corrosion-resistant-coated materials.
  1. Lift-and-Tilt Mechanisms: With permanently lubricated moving parts.
- B. Unit Sizes: Obtain units fabricated in sizes to fill window and other openings as follows, measured at 74 deg F:
  1. Blind Units Installed between (inside) Jamb: Width equal to 1/4 inch per side or 1/2 inch total, plus or minus 1/8 inch, less than jamb-to-jamb dimension of opening in which each blind is installed. Length equal to 1/4 inch, plus or minus 1/8 inch, less than head-to-sill dimension of opening in which each blind is installed.
  2. Blind Units Installed outside Jamb: Width and length as indicated, with terminations between blinds of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.
- C. Installation Brackets: Designed for easy removal and reinstallation of blind, for supporting headrail, and operating hardware, and for hardware position and blind mounting method indicated.
  1. Fabricate from steel, marked left and right to facilitate installation, with 1-1/4-inch extra wide top to accommodate power screwdriver.
  2. Finish: Prime coat of vinyl primer with finish coat of polyester baked enamel, to match headrail.
- D. Installation Fasteners: No fewer than two fasteners per bracket, fabricated from metal noncorrosive to blind hardware and adjoining construction; type designed for securing to supporting substrate; and supporting blinds and accessories under conditions of normal use.
- E. Color-Coated Finish:
  1. Metal: For components exposed to view, apply manufacturer's standard baked finish complying with manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.

- F. Component Color: Provide rails, cords, ladders, and exposed-to-view metal, and plastic matching or coordinating with slat color, unless otherwise indicated.

### PART 3 - EXECUTION

#### 3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.2 INSTALLATION

- A. Install horizontal louver blinds level and plumb and aligned with adjacent units according to manufacturer's written instructions, and located so exterior slat edges in any position are not closer than 1 inch to interior face of glass. Install intermediate support as required to prevent deflection in headrail. Allow clearances between adjacent blinds and for operating glazed opening's operation hardware if any.

- B. Flush Mounted: Install horizontal louver blinds with slat edges flush with finish face of opening if slats are tilted open.

- C. Jamb Mounted: Install headrail flush with face of opening jamb and head.

- D. Head Mounted: Install headrail on face of opening head.

#### 3.3 ADJUSTING

- A. Adjust horizontal louver blinds to operate smoothly, easily, safely, and free of binding or malfunction throughout entire operational range.

#### 3.4 CLEANING AND PROTECTION

- A. Clean horizontal louver blind surfaces after installation, according to manufacturer's written instructions.

- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that horizontal louver blinds are without damage or deterioration at time of Substantial Completion.

- C. Replace damaged horizontal louver blinds that cannot be repaired, in a manner approved by Engineer, before time of Substantial Completion.

#### 3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain systems.

3.6 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout.

### COMPUTERS AND MISCELLANEOUS EQUIPMENT

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

1. Work required by this section is indicated on the Contract Drawings and by the requirements of this section.
2. The components as required to provide a complete supervisory control and data acquisition (SCADA) servers at the Town of Sharon Wells 2, 3, and 4 Water Treatment Plant (WTP) in accordance with the Specifications and Drawings, by the control systems integrator/ supplier (Integrator) as specified in Section 13320.
3. Installation and start-up of computer system.
4. Testing of the computer system.
5. Coordination with work to be completed by the Application Engineer.

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements
2. Division 1 – General Requirements
3. Division 13 – Special Construction
4. Division 16 – Electrical

##### 1.3 SUBMITTALS

- A. Submit in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein.
- B. Provide complete equipment specifications, details of all connections, wiring diagrams, and component dimensions.
- C. Submittals consisting of only general sales literature will not be acceptable.

- D. Submit detailed information for each product listed below clearly indicating compliance with each of the specifications. Indicate any deviations from that specified and the reason for deviation.
- E. Submit all software licenses to the Owner. Licenses shall be made out in Owner's name.
- F. Submit O&M information as specified in Paragraph 1.5.

#### 1.4 QUALITY ASSURANCE

- A. Provide in accordance with Section 01400 – Quality Assurance and as specified. Installer's Qualifications - Firms regularly engaged in the installation, programming, and testing of computer and network systems, with a minimum of five years of experience or a minimum of ten (10) fully installed system, have functioned satisfactorily in similar service for a minimum of two (2) years and have demonstrated proficiency and extensive experience with current technology.

#### 1.5 OPERATIONS AND MAINTENANCE MANUALS

- A. Furnish six (6) complete sets of Operations and Maintenance Instruction Manuals (O&M Manuals) prior to start-up. Furnish one (1) electronic Adobe PDF searchable version on thumb drive or CD-ROM.
- B. Provide O&M manuals for each software package supplied.
- C. O&M manuals for the servers and all components inside shall be include. Manuals should include:
  - 1. Processor;
  - 2. Modems;
  - 3. Optical Drive;
  - 4. Sound Card;
  - 5. Video Card (if provided);
  - 6. DVD Drive
  - 7. Internal Hard Drive
  - 8. Network Interface Card
  - 9. Motherboard; and
  - 10. Ethernet Card.
- D. Provide O&M manual for the mouse.

- E. Provide O&M manual for the monitor.
- F. Provide O&M manual for the printer.
- G. Provide O&M manual for the server tower.
- H. Refer to Specification Section 01730 – Operation and Maintenance Data for additional requirements.

## 1.6 SPARE PARTS

- A. Spare parts shall include the following:
  - 1. One connecting cable for each type used;
  - 2. One matching power supply;
  - 3. One mouse – same type as provided;
  - 4. One keyboard – same type as provided;
  - 5. 500 writable CDs;
  - 6. 10 – 16 GB USB 3.0 Thumb Drives; and
  - 7. Printer accessories/supplies as specified below.
- B. Spare parts shall be packaged so as to prevent damage during long storage at the WTP. All packages shall be legibly and properly identified with indelible markings on the exterior as to contents.
- C. Complete ordering information including manufacturer, part number, part name, and equipment for which the part is to be used shall be provided.
- D. All spare parts/accessories provided under this section shall be turned over to the Owner at the same time accompanied by a written transmittal listing each specific item and quantity.

## 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Control, delivery, storage, and handling of equipment in accordance with Sections 01600 and 01610.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. Type

1. All computer hardware and software supplied shall be of the manufacturer's latest version.
2. All equipment furnished shall be suitable for operation on 120 VAC, 60-hertz electrical power.
3. Hardware and software products required for communications between the Programmable Logic Controllers (PLCs) and the SCADA servers shall consist of standard products offered by either the computer software publisher or the PLC manufacturer.

B. Lightning/Surge Protection

1. General - Lightning/surge protection shall be provided to protect the system from inducted surges and shall be separate from the Uninterruptible Power Supply (UPS) specified below and shall be installed such that it protects the UPS as well.

2.2 SERVERS (PC)

A. The two SCADA Servers shall run the SCADA software, function as an operator interface (OI)/Human Machine Interface (HMI) and, serve as a control/alarm monitoring system for the WTP and the Well Stations 2, 3, and 4. The SCADA Servers shall be located at the Wells 2, 3, and 4 Water Treatment Plant (WTP). The SCADA Servers shall meet these minimum requirements and achieve the performance goals in the control system software specification.

B. General Requirements

1. Provide servers to meet requirements for the Process Control System SCADA and all other SCADA support functions.
2. Provide tower-mount server, with all necessary items for installation, including interconnecting cables, mounting hardware, and appurtenances.
3. Provide all documentation, manuals, and licenses.

C. Features:

1. Tower form factor.
2. Processor: Intel Xeon Processor or Engineer approved equal. 4 cores or more, minimum 3.4 GHz, and minimum 8 MB cache.
3. RAM (Random-Access Memory): 16 GB UDIMM, 3200 MT/s, ECC, minimum.
4. Support 1920 x 1080 at 75 Hz monitor resolution.
5. Internal Hard Drive Configuration:

- a. Provide two (2) separate internal hard drives.
  - b. Type: 7.2k RPM SATA, 3.5", 6 Gbps
  - c. Capacity: 2.0 TB, minimum, each
  - d. RAID: 1
6. Removable Media Drive: DVD Dual-layer Drive with both Read and Write Capability.
7. Network Interface Cards (NIC):
- a. Provide two (2) separate NIC cards.
  - b. Network cards shall be of the same type and manufacturer.
  - c. All network ports shall at minimum support 1 Gbps transmission rate.
8. Power Supply: 125 VAC, 60 Hz
9. Warranty (parts & labor): 1 year
10. Acceptable Manufacturers
- a. Dell PowerEdge T150 (basis of design)
  - b. Hewlett-Packard ProLiant
  - c. Cisco UCS
  - d. Or approved equal.

### 2.3 OPERATING SYSTEM AND SOFTWARE

- A. 64-bit Windows Operating System Compatibility Requirement:
  - 1. SCADA Servers: Windows Server 2022 Standard, 16CORE
  - 2. PC Workstation: Windows 10 Pro
- B. Microsoft Office Professional 2021
- C. Adobe Acrobat Reader, latest edition
- D. Web Browser: Microsoft Edge, latest edition
- E. All software licenses shall be registered by the Contractor in the Owner's name.

- F. All software shall be licensed to the Owner; end user license agreements and proof of purchase to be submitted to Owner.

## 2.4 MONITORS

- A. Each SCADA Server shall be provided with a monitor that meets the below specifications.
- B. Features:
  - 1. Screen Size: 27-inch
  - 2. Screen Type: IPS panel with antiglare coating
  - 3. Native Resolution: 1920 x 1080 at 75 Hz
  - 4. Input Connectors:
    - a. (1) HDMI Port (v. 1.4)
    - b. (1) Display Port 1.2
    - c. (1) Audio line-out port
  - 5. Acceptable Manufacturers:
    - a. Dell
    - b. Asus
    - c. HP
    - d. Or approved equal.

## 2.5 PRINTER

- A. Type: Laser
- B. Printer to be located adjacent to SCADA Servers
- C. Interface: Wired Ethernet
- D. Paper weight: 24 Lbs
- E. Print resolution: 4800 x 2400 dpi color
- F. Rated speed: 25 ISO ppm Black/White, 12 ISO ppm Full Color
- G. Compatible with Windows Server 2022 Operating System
- H. Warranty (parts & labor): 1 year
- I. Accessories/supplies:

1. Scanning capability
2. Connecting cable
3. One spare toner cartridge for each type used, in addition to ones installed in the printer originally
4. 500 sheets, 24 LB, A size printing paper
5. Support software with all necessary drivers

J. Acceptable Manufacturers

1. Epson WorkForce Pro WF-C4810 Color Multifunction Printer (basis of design)
  2. Canon
  3. Hewlett Packard
- Or approved equal.

2.6 Accessories:

A. Mouse

1. USB Wireless connectivity
2. Combination set with keyboard
3. Optical
4. Compatible with Windows Server 2022
5. Manufacturers:
  - a. Logitech Signature M550 L
  - b. Dell
  - c. Microsoft
  - d. Or approved equal.

B. Keyboard

1. USB Wireless connectivity
2. Combination set with keyboard
3. Standard 104 key configuration
4. Cushioned palm rest
5. Compatible with Windows Server 2022
6. Manufacturers:
  - a. Logitech Wave Keys MK67
  - b. Dell
  - c. Microsoft
  - d. Or approved equal.

PART 3 – EXECUTION

3.1 INSTALLATION

- A. The Integrator shall furnish the servers, software, and ancillary equipment to the Application Engineer for servers set up, configuration, and programming. The

Contractor shall be responsible for coordinating this work with the Application Engineer.

- B. The Application Engineer shall deliver the configured and programmed servers to the Contractor for installation. The SCADA servers, peripherals, and accessory equipment shall be installed by the Integrator in accordance with the manufacturer's instructions and located as shown on the contract drawings or as approved by the Owner.
- C. The Integrator shall coordinate the installation, the placing and location of system components, and connections to the process components, panels, cabinets and devices. The Integrator shall be responsible to ensure that all field wiring for power and signal circuits between existing devices and PLCs are correctly done in accordance with best industry practice to ensure a satisfactory functioning installation and a high degree of lightning surge protection at both ends of all systems/connectors.

### 3.2 TESTS AND ACCEPTANCE

- A. The Integrator shall perform onsite operability tests and system acceptance tests.
- B. The Integrator shall train Owner's personnel in the operation of the SCADA servers. This training is considered formal and may not coincide with the system acceptance test.
- C. Provide four (4) hours of training on the SCADA servers system, not including travel time.

### 3.3 SOFTWARE VERSIONS, UPDATES, AND LICENSING

- A. The Integrator shall provide the latest version of each software package being provided with all update service packs that may apply.
- B. The software provided by the Integrator shall be compatible with the specified servers operating system.
- C. The Integrator shall include all necessary licensing for operation of the software on the computer system provided.
- D. The Integrator shall provide to the Owner a software update service as part of the warranty and/or maintenance contract for this project for a minimum of 1 year.

### 3.4 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.

- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.5 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 001700 – Contract Closeout.

END OF SECTION 13100

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 13120

### METAL BUILDING SYSTEMS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes following:

1. Structural steel main building framing.
2. Secondary framing including purlins; girts; sag rods; and bracings and supports for canopies, door, window, mechanical and process openings, and mechanical components.
3. Insulated roof panels and insulated wall panels.
4. Gutters and downspouts.
5. Snow guards.
6. Anchor bolts.
7. Accessories, trim, flashing, sealants, and all other appurtenances required for a complete, weathertight metal building system.

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements.
2. Division 1 – General Requirements.
3. Section 03300 “Cast-In-Place Concrete” for concrete work.
5. Section 05400 “Cold-Formed Metal Framing” for framing associated with dormers to be installed in the metal building system.
6. Section 07620 “Sheet Metal Flashing and Trim” for stainless steel counter-flashing to be installed as part of the work of this Section.
7. Section 07920 “Joint Sealants” for sealants between the metal building system components and items installed under other sections.

8. Section 08331 “Overhead Coiling Doors” for overhead doors to be installed in the metal building system.
9. Section 08413 “Aluminum-Framed Entrances” for aluminum frames to be installed in the metal building system.
10. Section 08513 “Aluminum Windows” for aluminum windows to be installed in the metal building system.
11. Section 08950 “Fiberglass-Sandwich-Panel Assemblies” for fiberglass-sandwich-panel assemblies to be installed in the metal building system.
12. Section 10200 “Fixed Louvers” for louvers to be installed in the metal building system.
13. Division 11 “EQUIPMENT” for mechanical work to be installed in the metal building system.
14. Division 15 “MECHANICAL” for plumbing, HVAC, and fire protection work to be installed in the metal building system.
15. Division 16 “ELECTRICAL” for electrical work to be installed in the metal building system.

### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of the Contract and Division 1 Specification Sections and as specified herein.
  - A. Product Data: Submit product data for all components of the metal building system, including material descriptions, dimensions and profiles of components, construction details and finishes.
  - B. Shop Drawings: Submit shop drawings for entire metal building system, including plans, elevations, wall sections, details and all other drawings required for full review of building system compliance with Contract Drawing and Specification requirements.
  - C. Drawings to show the shapes of all members, design and erection drawings, and an isometric view of the roof showing the design wind uplift pressure and dimensions of edge and corner zones. Shop painting and finishing specifications. Anchor bolt placement plan and column reactions.
  - D. Color Selector: Selectors for full range of colors available for interior and exterior of insulated roof panels and insulated wall panels.
  - E. Design Certification: Letter signed and sealed by a structural engineer registered in the Commonwealth of Massachusetts certifying metal building system complies with all applicable Massachusetts Codes and Regulations.

F. Structural Calculations: Calculations for structural design of the metal building system signed and sealed by a structural engineer registered in the Commonwealth of Massachusetts showing design's compliance with all structural requirements of the applicable Massachusetts Codes and Regulations, including dead loads, wind loads, snow loads, lateral loads and foundation reactions for all load combinations.

G. Samples

1. Accessories: One sample of each type of flashing, trim, closure, cap and similar items. Size shall be sufficient to show construction and configuration.
2. Roofing and Siding: One piece of each type and finish (exterior and interior) to be used, 9 inches long, full width. The sample for factory color finished covering shall be accompanied by certified laboratory test reports showing that the sheets to be furnished are produced under a continuing quality control program and that a representative sample consisting of not less than 5 pieces has been tested and has met the quality standards specified for factory color finish.
3. Fasteners: Two samples of each type to be used, with statement regarding intended use. If so requested, random samples of bolts, nuts, and washers as delivered to the job site shall be taken in the presence of the Contracting Officer and provided to the Contracting Officer for testing to establish compliance with specified requirements.
4. Gaskets and Insulating Compounds: Two samples of each type to be used and descriptive data.
5. Sealant: One sample, approximately 1 pound, and descriptive data.

H. On-Site Sample Coordination Meeting: The General Contractor, metal building manufacturer and erector, Owner, and Engineer shall meet on site to coordinate and confirm all finish selections.

I. Mockups: Construct on-site mockup of exterior wall components, including trim and flashing. Coordinate with Section 04001 for masonry veneer installed over insulated metal backup wall panel system.

J. Welding Certificates: Copies of certificates for welding procedures and personnel.

K. AISC Certifications: Copies of certifications of Manufacturer and Erector.

L. Signed Warranties for building system, roof panel and wall panels and weathertightness.

## 1.4 PERFORMANCE REQUIREMENTS

- A. Metal building system design in accordance with AISC 360-10, "Specification for Structural Steel Buildings," and Mass. State Building Code, current edition.
- B. Construction shall comply with AISC 303-10, "Code of Standard Practice for Steel Buildings and Bridges."
- C. Welding shall comply with AWS D1.1, "Structural Welding Code - Steel" and AWS D1.3, "Structural Welding Code - Sheet Steel."
- D. Cold-formed steel shall comply with AISI SG-671, "Specification for Design of Cold- Formed Steel Structural Members."
- E. Bolted connections shall comply with Research Council on Structural Connections (RCSC) "Specification for Structural Joints Using ASTM A325 and A490 Bolts."
- F. The metal building system covered under this specification shall be provided by a single manufacturer and shall include all components and assemblies that form a building. Structural Standing Seam Metal Roofing System shall be furnished as part of a single manufacturer's system.
- G. Primary frame shall be solid-member, clear span, rigid frame with pinned column bases; and, in accord with AISC recommendations: Column base plates and anchor bolts shall be designed and detailed to transfer shear load to the foundation.
- H. Secondary framing girts shall be inset type as shown on drawings. Purlins shall be supported on top flange of the frame girders and shall be braced at quarter spans. Purlin bracing shall be full depth bracing.
- I. Thermal Movements: Provide metal building roof and wall panels systems that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg. F ambient; 180 deg. F material surfaces.
- J. Building envelope shall be designed with a continuous air barrier to control air leakage into and out of conditioned space. Air permeability barrier shall not exceed 0.004 cubic feet per minute per square foot under a pressure differential of 0.3 inches of water.

- K. Water Penetration for Roof Panels: Provide roof panel system with no water penetration when tested according to ASTM E 1646 at a minimum differential pressure of 20 percent of inward-acting, wind-load design pressure of not less than 6.24 pounds per square foot and not more than 12 pounds per square foot.
- L. Water Penetration for Wall Panels: Provide wall panel system with no water penetration when tested according to ASTM E 331 at a minimum differential pressure of 20 percent of inward-acting, wind-load design pressure of not less than 6.24 pounds per square foot and not more than 12 pounds per square foot.

## 1.5 QUALITY ASSURANCE

- A. Metal building shall be the product of a recognized steel building systems manufacturer who has been in the practice of manufacturing steel building systems for a period of not less than 5 years. The manufacturer shall be chiefly engaged in the practice of designing and fabricating steel building systems. The manufacturer shall be certified under the Metal Building Systems (MB) Certification Program, AISC FCD. Structural framing and covering shall be designed by a licensed Professional Engineer registered in the Commonwealth of Massachusetts and experienced in design of this work.
- B. Erector shall have specialized experience in the erection of steel building systems for a period of at least 5 years. Framing shall be erected in accordance with MBMA Low Rise Manual, common industry practices and erection instructions describing the basic sequence of assembly, temporary bracing, shoring, and related information necessary for erection of the metal building including its structural framework and components. The erector shall furnish temporary guys and bracing where needed for squaring, plumbing, and securing the structural framing against loads acting on the exposed framing, such as wind loads and seismic forces, as well as loads due to erection equipment and erection operation. Bracing furnished by the manufacturer for the metal building system shall not be assumed to be adequate during erection. Structural members shall not be field cut or altered without approval of the metal building manufacturer. Welds, abrasions, and surfaces not galvanized shall be primed after erection.
- C. Erector shall investigate and be familiar with the site to prevent causing damage to existing adjacent structures and utilities, above or below grade, during the erection of the structure. Erector shall be fully liable for any damage caused to existing adjacent structures and utilities above or below grade.
- D. A representative designated by the building manufacturer, who is familiar with the design of the building supplied and experienced in the erection of metal buildings similar in size to the one required under this contract, shall be present at the job site during construction, from the start of the structural

framing erection until completion of the installation of the exterior covering, to assure that the building is erected properly.

- E. At the conclusion of construction, the building manufacturer will provide written certification that the building was erected in accordance with the design and all applicable codes and standards.

## 1.6 DESIGN REQUIREMENTS

- A. Criteria and definitions shall be in accordance with MBMA Low Rise Manual, except criteria for seismic loads shall be in accordance 780 CMR State Building Code of the Commonwealth of Massachusetts, with TI 809-04, the design loads as shown on structural drawings and all other loads and load combinations in accordance with ASCE 7, whichever is more stringent.
- B. The dead load shall consist of the weight of all permanent construction such as roof, framing, covering members and all other materials of the building system.
- C. Collateral loads shall be applied to the entire structure to account for the weight of additional permanent materials other than the building system, such as sprinklers, mechanical systems, electrical systems, and process piping. This allowance does not include the weight of hung equipment weighing 50 pounds or more. Equipment loads of 50 pounds or more shall be shown on the shop drawings and the structural members shall be strengthened as required. The Contractor is responsible for providing the building manufacturer the magnitude and approximate location of all concentrated loads greater than 50 pounds before design of the building commences.
- D. Additional localized dead loads such as supports for mechanical components shall be accounted for in the design of the building. The Contractor is responsible for providing the Building Manufacturer the magnitude and location of all additional loads.
- E. Uniform roof live loads, including maintenance traffic and construction loads, shall be determined and applied in accordance with 780 CMR State Building Code of the Commonwealth of Massachusetts or ASCE 7, whichever is more stringent.
- F. In addition to prescribed roof live loads, a minimum design concentrated load of 300 pounds shall be used to simulate a construction load on roof panels. The concentrated load shall be applied at the panel midspan and shall be resisted by a single standing seam metal roof panel, or a 24 inches wide corrugated metal panel, assumed to be acting as a beam. The undeformed shape of the panel shall be used to determine the section properties.
- G. The design roof snow loads, including effects of drifting, shall be determined and applied in accordance with 780 CMR State Building Code of the

Commonwealth of Massachusetts or as indicated on the Construction Drawings, whichever is more stringent.

- H. Wind pressures shall be computed and applied in accordance with 780 CMR State Building Code of the Commonwealth of Massachusetts or as indicated on the Construction Drawings, whichever is more stringent.
- I. Seismic loads shall be computed in accordance with 780 CMR State Building Code of the Commonwealth of Massachusetts or as indicated on the Construction Drawings, whichever is more stringent.
- J. Structural steel members and their connections shall be designed in accordance with AISC 360. Structural cold-formed steel framing members and their connections shall be designed in accordance with TI 809-07. Maximum live load deflection under applied live load, snow, or wind load shall not exceed 1/180th of the span length, including deflection of the roof and wall diaphragm. Members with openings in their webs shall be designed with consideration of the additional stresses which will result due to the openings. Deflections of the steel framing above and along the side of commercially framed door and window openings shall be limited to a maximum allowable deflection of 1/360 of the opening width to ensure proper operation. The contractor shall include the loads that the doors and windows transfer to the building frame in the design. All openings shall be framed all around and shall be designed to structurally replace the covering and framing displaced. The subpurlin and/or purlin spacing shall not exceed 30 inches on centers at the corner, edge and ridge zones, and 5 foot maximum on centers for the remainder of the roof. Provide solid blocking between roof purlins.
- K. Except as otherwise specified, steel roofing and siding shall be designed in accordance with AISI Cold-Formed design manual. Maximum deflection for wall and roof panels under applied live load, snow or wind loads shall not exceed 1/180th of the span length. The design analysis shall establish that the roof, when deflected under loading combinations, shall not result in ponding. Maximum deflections shall be based on sheets continuous across two or more supports with sheets unfastened and fully free to deflect. The calculated deflection from the concentrated load shall not exceed 1/180 of the span length. The methods for resisting lateral loads shall be cross-bracing, rigid frames, or wind columns.

## 1.7 DESIGN ANALYSIS

- A. The design analysis shall be done by a registered Professional Engineer, registered in the Commonwealth of Massachusetts, experienced in design of this work and shall include complete calculations for the building, its components, and the foundations. Foundations shown on the drawings are based on loads derived from a representative set of similar building types. Formulas and references shall be identified. Assumptions and conclusions shall be explained, and cross-referencing shall be clear. Wind forces on

various parts of the structure, both positive and negative pressure, shall be calculated with the controlling pressure summarized. Lateral forces due to seismic loading shall be calculated and tabulated for the various parts and portions of the building. Computer programmed designs shall be accompanied by stress values and a letter of certification, signed by a Professional Structural Engineer registered in the Commonwealth of Massachusetts, stating the design criteria and procedures used and attesting to the adequacy and accuracy of the design. A narrative of the computer program delineating the basic methodology shall be included. Computer program output shall be annotated and supplemented with sketches to verify the input and output. Critical load conditions used in the final sizing of the members shall be emphasized. The design analysis shall include the name and office phone number of the designer, who shall function as a point of contact to answer questions during the detail drawing review.

- B. Submit design calculations, including reactions to foundation to the Engineer for review and use.

## 1.8 WARRANTIES

- A. Material Warranty: Manufacturers standard form in which manufacturer agrees to repair or replace metal building system wall and roof panels that fail in workmanship or materials within specified warranty period. Failures include, but are not limited to:
  - 1. Structural failures including rupture, buckling or perforation.
  - 2. Weathertightness failures including roof leaks or wall drafts.
  - 3. Deterioration of metals, finishes and other materials beyond normal weathering and use, including rusting.
- B. Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components that show evidence of deterioration of factory-applied finishes within specified warranty period.
- C. Period of Warranties: Twenty (20) years from date of Substantial Completion.

## 1.9 PRODUCT HANDLING

- A. Deliver components, sheets, panels and other items undamaged, undeformed and in all conditions fully suited for use in construction of the metal building system.
- B. Unload, store and erect roof and wall panels to prevent bending, warping, twisting and any surface damage.
- C. Stack delivered materials on platforms or pallets, covered with tarpaulins or other suitable weathertight, ventilated covering.

- D. Store roof and wall panels to ensure dryness; do not store panels in contact with other materials that might cause staining, denting or other surface damage.

#### 1.10 COORDINATION

- A. Coordinate location, number, size and placement of anchor bolts with concrete work.
- B. Coordinate metal building system work with the work of all trades affected by metal building system erection, panel installation and other related work.
- C. A coordination meeting shall be held within 45 days after contract award for mutual understanding of the metal building system contract requirements. This meeting shall take place at the building site and shall include representatives from the Contractor, the roofing/metal building system manufacturer, the roofing/metal building supplier, the erector, the designer, and the Owner's Representative. All items required by paragraph SUBMITTALS shall be discussed, including applicable standard manufacturer shop drawings, and the approval process. The Contractor shall coordinate time and arrangements for the meeting.

### PART 2 - PRODUCTS

#### 2.1 FRAMING

- A. Each piece or part of the assembly shall be clearly and legibly marked to correspond with the drawings.
- B. Hot-rolled Shapes: W-shapes shall conform to ASTM A992 (50 ksi minimum yield strength); channels shall conform to either ASTM A36 or ASTM A572 grade 50; other steel shapes shall conform to ASTM A36.
- C. Steel Plate, Bar or Strip: ASTM A572, 50 ksi minimum yield strength.
- D. Welding electrodes shall comply with AWS requirements, with a tensile strength level of 70 ksi.
- E. Anchor bolts shall be of sizes required by certified design, threaded, headed and made of ASTM F1554 Grade 36 steel.
- F. Bolts shall be ASTM A325 Type I, heavy-hex.
- G. Nuts shall be ASTM A563, heavy-hex.
- H. Washers shall be ASTM F436, hardened steel.
- I. Plate washers shall be ASTM A36.
- J. Tension-control bolts assemblies shall be ASTM F1852 Type I, heavy-hex.

K. Direct tension indicators shall be ASTM F959, Type 325, compressible washer type.

L. Threaded rods shall be ASTM A36.

## 2.2 INSULATED ROOF PANELS AND SUPPORTS

### A. Roof Construction:

1. UL construction (uplift) rating of not less than Class I-90 required.
2. Single panel from eave to ridge.
3. Deflection of roof panel shall not exceed 1/180 of its span when supporting applicable design loads.

### B. Standing Seam Roof Panels:

1. Exterior Facing: 22 gauge AZ-50 aluminum-zinc coated steel, 2 in. high lap lock or batten clip standing seam, with 1/8 in. nominal depth wave pattern, non-directional embossed, between seams.
2. Insulation: Foamed-in-place, non-CFC, zero ozone-depleting polyurethane, Factory Mutual Class 1 approval.
3. Interior Facing: 22 gauge AZ-50 aluminum-zinc coated steel, flat surface, with 1/16 in. nominal depth wave pattern, non-directional embossed.
4. Panel Width: 36 in. minimum.
5. Panel Length: As required for single panel coverage from eave to ridge
6. Panel Thickness: 5 in. minimum, with max. U-Factor of 0.027.
7. Finishes:
  - i. Exterior: Kynar 500/Hylar 5000.
  - ii. Interior: Silicone polyester.
8. Colors (including metal trim): As selected by Engineer from Basis-of-Design manufacturer's (Metl-Span) full range of 26 Standard Exterior and Premium I Exterior colors.

### C. Fasteners and Accessories:

1. Provide roof jacks and roof curbs as required by the roof penetrations in accord with metal building system manufacturer's design and construction standards for compatibility with standing seam roof, including visual appearance and weathertightness.

2. Concealed stainless steel or aluminum fasteners and/or clips with thermal break.
3. Metal flashing, closure panels and accessories to match panels in materials and finishes.

D. Acceptable Products:

1. Basis-of-Design: CFR Roof Panel, by Metl-Span, LLC, Lewisville, Texas.
2. Standing Seam (SR2) Roof Panel, by Nucor Building Systems.
3. Isoleren RL Roof Panel, by ATAS International, Inc.
4. Or approved equal.

## 2.3 INSULATED WALL PANELS AND SUPPORTS

A. Wall Construction:

1. Deflection of single wall panel shall not exceed 1/180 of its span when supporting applicable design loads.

B. Wall Panels:

1. Exterior Facing: 22 gauge AZ-50 aluminum-zinc coated steel, architectural surface, with 1" wide by nominal 3/8" deep reveals at approx. 8.4" on center, non-directional embossed.
2. Insulation: Foamed-in-place, non-CFC, zero ozone-depleting polyurethane, Factory Mutual Class 1 approval.
3. Interior Facing: 22 gauge AZ-50 aluminum-zinc coated steel, flat surface, with 1/16 in. nominal depth wave pattern, non-directional embossed.
4. Panel Width: 36 in. minimum.
5. Panel Thickness: 4 in. minimum, with max. U-Factor of 0.032.
6. Finishes:
  - i. Exterior: Kynar 500/Hylar 5000.
  - ii. Interior: Silicone polyester.
7. Colors (including metal trim): As selected by Engineer from Basis-of-Design manufacturer's (Metl-Span) full range of 26 Standard Exterior and Premium I Exterior colors.

C. Fasteners and Accessories:

1. Provide all trim, wall opening subframes and fastenings required to complete a finished, weathertight metal building.
2. Stainless steel fasteners and/or clips; fastening of wall panels to framing to be done with interlocking ribs toward the interior, eliminating fasteners exposed to exterior.
3. Metal flashing, closure panels and trim to match panels in materials and finishes.

D. Acceptable Products:

1. Basis-of-Design: CF Flute Wall Panel, by Metl-Span, LLC, Lewisville, Texas.
2. Isoleren SL Wall Panel, by ATAS International, Inc.
3. ShadowLine Wall Panel, by Green Span Profiles.
4. Or approved equal.

## 2.4 RAIL-TYPE SNOW GUARDS

A. Seam-Mounted, Rail-Type Snow Guards:

1. Basis-of-Design: Alpine SnowGuards (a division of Vermont Slate & Copper Services), Model ASG4025; or a comparable product by one of the following:
2. Rocky Mountain Snow Guards, Inc.
3. Sno Gem, Inc.

B. Description:

1. Units fabricated from metal baseplate anchored to fixed bracket and equipped with two bars.
2. Finish: Powder coat in custom color to match standing seam metal roof panels.
3. Bracket: 6000 Series aluminum.
4. Base Plate: 11 gauge, Type 304 stainless steel with two 5/16-inch Type 304 stainless steel machine screws welded into countersinks.
5. Tubing: 6000 Series extruded aluminum, 1 inch outside diameter and 0.120-inch wall thickness.

6. Couplings: 6000 Series aluminum; internal and concealed couplings 3 inches long.
7. End Caps: Type 304 stainless steel.
8. End Collars: 6000 Series aluminum.
9. Ice Flags: 6000 Series aluminum, 3 inches wide by length required.

## 2.5 STRUCTURAL STEEL PRIMER

- A. All uncoated structural steel shall be given one (1) shop coat of rust-inhibitive (primer) paint; surface preparation shall conform to SP-6, commercial blast, unless otherwise required.

## 2.6 SEALANT

- A. Sealant shall be an elastomeric type containing no oil or asphalt. Exposed sealant shall be colored to match the applicable building color and shall cure to a rubber like consistency.

## 2.7 GASKETS AND INSULATING COMPOUNDS

- A. Gaskets and insulating compounds shall be nonabsorptive and suitable for insulating contact points of incompatible materials. Insulating compounds shall be nonrunning after drying.

## PART 3 - EXECUTION

### 3.1 ERECTION

#### A. General:

1. Erect metal building system in strict accord with manufacturer's written instruction and erection drawings.
2. Set structural framing in location and to elevations indicated and in accord with AISC specifications referenced above; maintain structural stability of frame during erection.
3. Do not field cut, drill or alter structural members without written approval from metal building system manufacturer's Mass. registered structural engineer.
4. Erect framing true to line, level, plumb, rigid and secure.

#### B. Leveling Plates, Baseplates and Bearing Plates:

1. Clean bearing surfaces of bond-reducing materials and roughen surfaces before setting baseplates and bearing plates; clean bottom surface of baseplates and bearing plates.
  2. Set baseplates and bearing plates for structural members on wedges, shims or setting nuts.
  3. Level baseplates to a true even plane with full bearing to supporting structures; set baseplates with double-nutted bolts.
  4. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims; if protruding, cut-off flush with edge of baseplate or bearing plate before packing with grout.
  5. Pack grout solidly between bearing surface and plates so no voids remain. Finish exposed surfaces, protect installed materials and allow to cure. Comply with manufacturer's written instructions for grout materials.
  6. Moist cure grout for not less than seven days after placement.
- C. Align and adjust framing members before permanently fastening; before assembly, clean bearing surfaces and other surfaces that will be in permanent contact. Make adjustments to compensate for discrepancies in elevations and alignments.
1. Level and plumb individual members of structure.
  2. Establish required leveling and plumbing measurement on mean operating temperature of structure; make allowances for difference between temperature at time of erection and mean temperature at which structure will be when completed and in service.
  3. Make field connections using high-strength bolts; tighten bolts by turn-of-the-nut method.
- D. Secondary Framing:
1. Fasten secondary framing to primary framing using clips with field connections using non-high-strength bolts; hold rigidly to straight line by sag rods.
  2. Provide rake and gable purlins with tight-fitting closure channels and fascias.
  3. Locate and space girts and purling to suit:
    - i. Openings for doors, louvers, windows, vents, curbs and any other wall or roof penetrations.
    - ii. Canopy projections.

4. Provide supplemental framing at entire perimeter of openings and penetrations of roof and walls.

E. Bracing:

1. Install bracing in roof and walls where shown on erection drawings and as otherwise required.
2. Tighten rod and cable bracing to avoid sag.
3. Locate interior end bay bracing only where indicated.

F. Framing for Openings:

1. Provide shapes of proper design and size to reinforce openings and to carry load and vibrations imposed for all equipment furnished under mechanical and electrical work or otherwise included in the project work.
2. Securely attach framing for openings to building structural frame.

G. Roof, Wall and Canopy Panels:

1. Securely fasten panels to structure and secondary framing in strict accord with manufacturer's written instructions.
2. Use concealed fasteners unless otherwise required by manufacturer's building and panel system.

H. Trim and Accessories: Securely fasten all trim and accessories to supporting structure or panels, as recommended by manufacturer.

### 3.2 CORRECTING, TOUCH-UP AND CLEANING

- A. Check all connections, materials and surfaces of completed metal building; correct any defects found, including but not limited to installing missing screws and fasteners, sealing openings, repairing dents, grinding uneven surfaces.
- B. Touch-up abrasions in primer on structural steel framing with coating compatible with, and matching in color and gloss, factory-applied primer.
- C. Touch-up minor abrasions in finishes on panels with air-dried coating compatible with, and matching in color and gloss, factory-applied finish coating.
- D. Replace any roof or wall panels that are dented, deeply scratched or otherwise not suitable for touch-up, as determined by the Engineer, with new panels at no additional cost to the Owner – no exceptions.

E. Clean all exposed surfaces of completed metal building system.

3.3 EXTRA MATERIALS

A. Provide six complete, full-width insulated metal wall panels. Panel length to match longest length provided for the project but not less than 30 feet. Provide a complete set of clips, anchors, and fasteners as may be required to install extra wall panels.

3.4 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 13120

## SECTION 13200

### PROGRAMMABLE LOGIC CONTROLLERS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

1. Provide Programmable logic controllers (PLCs) and operator interface terminals in accordance with this Section.
2. This specification has been developed to establish minimum requirements for a solid-state PLC designed to provide high reliability in industrial applications. All controllers provided under this Contract shall meet the requirements of this Specification. All controllers are to be of the same manufacturer.
3. The internal wiring of each controller is to be fixed, with the logic functions each must perform in a given application to be programmed into its memory. Each controller shall be supplied with the central processing unit (CPU), input/output scanner, inputs, outputs, memory, power supply, and all power and interface cables necessary to function as a complete and operable programmable controller system.
4. The Integrator shall use the equipment, instrument, and loop numbering scheme that has been developed and shown on the Drawings in the development of all submittals.
5. The Integrator shall coordinate with equipment manufacturers (provided under other Specifications Divisions) prior to programming to review equipment operations, functions, interlocks, and ancillary requirements to provide a complete, functional controls system.
6. Furnishing of all labor, equipment, appliances, and materials, and in performing all operations in connection with furnishing, installation, testing, and training of a programmable controller system complete and in place, in accordance with the Contract Drawings and Specifications.
7. The Integrator shall coordinate with the Application Engineer.

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements

2. Division 1 – General Requirements
3. Division 11 – Equipment
4. Division 13 – Special Construction
5. Division 15 – Mechanical
6. Division 16 – Electrical

C. Work not included:

1. Programming and configuration of Programmable Logic Controllers and Operator Interface Terminals (OITs).
2. Electrical conduit relays, raceways, starters, motor control centers, etc., required for operation, control, and monitoring of equipment shall be furnished and installed under Division 16 of these specifications.
3. The exterior power connections to all electrical devices furnished under this Section shall be performed under Division 16.
4. PLC programming; PLC I/O addressing; testing of PLC logic and computer based control system SCADA; OIT programming including graphics development; OIT software configuration; database development; and report development activities associated with the software portions of the SCADA and PLC systems shall be provided by the Application Engineer.

1.3 SUBMITTALS

- A. Submit in accordance with Section 01300- Submittals.
- B. Closeout and Maintenance Material Submittals: per Division 1 General Requirements.
- C. Product Data: Provide catalog sheets and technical data sheets to indicate physical data and electrical performance, electrical characteristics, and connection requirements.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product. Include equipment installation outline, connection diagram for external cabling, internal wiring diagram, and written instruction for installation.
- E. Submit Manufacturer's programming manuals.

1.4 QUALITY ASSURANCE

- A. Provide in accordance with Division 01 General Requirements, Section 01400 – Quality Assurance and as specified.

- B. Provide PLCs and OITs supplied from manufacturers regularly engaged in the production of such products, shall be standard products wherever possible, and shall be of the manufacturer's latest design.
- C. All PLC system components shall be new, free from defects, and produced by manufacturers regularly engaged in the manufacture of these products.
- D. Only communication modules for communication or network media functions that are not provided by the PLC manufacturer may be produced by third-party sources.
- E. Only PLC manufacturer-approved hardware, including cables, mounting hardware, connectors, enclosures, racks, communication cables, splitters, terminators and taps, may be used.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

A. Provide in accordance with Division 1 General Requirements.

B. Acceptance at Site

1. Check equipment, instruments, and materials for damage or defects within 7 days of delivery. Repair or replace to satisfaction of Engineer.
2. Special instructions for proper field handling and installation required by the manufacturer for proper protection shall be securely attached to each piece of equipment prior to shipment.
3. Each package shall be tagged to identify its location, tag number, and function in the system. Identification shall be prominently displayed on the outside of the package.
4. Equipment shall not be stored out-of-doors. Equipment shall be stored in dry permanent shelters and shall be adequately protected against mechanical injury. If any apparatus has been damaged, such damage shall be repaired or the damaged equipment replaced by the Contractor at his own cost and expense. If any apparatus has been subject to possible injury by water, it shall be thoroughly dried out and put through such tests as directed by the Engineer. This shall be at the cost and expense of the Contractor, or the apparatus shall be replaced by the Contractor at his own expense.

#### 1.6 COORDINATION

A. Coordination, Sequencing, and Scheduling: in accordance with Section 13320 Instrumentation and Controls.

### PART 2 – PRODUCTS

#### 2.1 PROGRAMMABLE LOGIC CONTROLLERS

D. Manufacturers

1. The Town of Sharon has standardized their PLC system on Allen-Bradley CompactLogix™ 5380 Programmable Logic Controllers (**No substitutions shall be allowed**).
- E. PLC hardware and programming software: by same manufacturer.
  - F. House PLCs in new or existing control panel as specified in Section 13420 Control System Equipment Panels and Racks. Provide 120VAC, 60 Hz, single phase power to control panel.
  - G. Minimum PLC input/output (I/O) requirements as indicated on Drawings. Provide additional 25 percent active spare I/O wired to terminal blocks; relay outputs, wired to interposing relays.
  - H. Provide PLC rack or mounting space to accommodate additional 25 percent minimum spare slots for future expansion.
  - I. Provide microprocessor-based PLC devices with power supplies, processors, process input and output modules, communication cards and chassis, mounted in control panel.
  - J. Size power supplies to accommodate analog signals, including spares, and card's entire I/O capacity.
  - K. Provide PLC capable of stand-alone operation in the event of SCADA network or SCADA computer failure.
  - L. The PLC shall be capable of performing the following basic math functions:
    1. Addition
    2. Subtraction
    3. Multiplication
    4. Division
    5. Square root
  - M. The PLC shall be capable of performing PID algorithms and control processes utilizing the PID output.
  - N. Provide UL listed PLC system using modular, field expandable design.
  - O. Module design shall prohibit upside down insertion or connection of modules and be compatible with processor type specified.
  - P. Operate programmable controller hardware at ambient temperature of 32-140 degrees F.  
F. Ambient temperature rating for storage: minus 40-185 degrees F.

- Q. Provide PLC hardware to function continuously in relative humidity range of 5 to 95%, non-condensing.
- R. Provide PLC system designed and tested to operate in the high electrical noise environment of an industrial plant.
- S. Module-expandable PLCs and associated modules shall meet the following acceptable level of quality:
  - A. Processor: Allen Bradley CompactLogix 5380 L3 series, 5069 L306ER.
  - B. Discrete input modules: Allen Bradley 5069-IQ16.
  - C. Discrete output modules: Allen Bradley 5069-OW16.
  - D. Analog input modules: Allen Bradley 5069-IF8.
  - E. Analog output modules: Allen Bradley 5069-OF8.
  - F. Memory module: Allen Bradley 1784-SD1.
- T. Chassis-based PLCs and associated modules shall meet the following acceptable level of quality:
  - A. Processor: Allen Bradley ControlLogix 1756-L81E series.
  - B. Discrete input modules: Allen Bradley 1756-IQ16 or 1756-IQ32.
  - C. Discrete output modules: Allen Bradley 1756-OW16.
  - D. Analog input modules: Allen Bradley 1756-IF8 or 1756-IF16.
  - E. Analog output modules: Allen Bradley 1756-OF8.

## 2.2 OPERATOR INTERFACE TERMINALS

- A. House OITs in new or existing control panel as specified in Section 13420 Control System Equipment Panels and Racks.
- B. Operator interface terminal: color graphic display connecting directly to PLC communication port or a communication module, allowing viewing and changing of PLC parameters, rated NEMA 4/4X, powered by 24VDC with integrated real time clock and battery backup.
- C. The OIT shall have a minimum resolution of 800 x 600 VGA (10.4 inch) and 1024 x 768 XGA (15 inch) with 18-bit color graphics.
- D. Provide OIT with 80MB internal project memory with compact flash port. Provide one (1) GB SD flash card for each operator terminal.

- E. Provide OIT with ability to display a selectable screen based on specific alarm bits.
- F. Provide OIT with ability to communicate to more than one PLC.
- G. Provide all communication modules and cables for OIT - PLC communications. PLC interface: Ethernet/IP.
- H. Provide and coordinate communications protocol drivers to establish reliable communications between PLC and OIT.
- I. Furnish licensed copy of OIT software to be installed by the Engineer.
- J. OITs shall be Allen-Bradley PanelView Plus 7 Performance 10.4-inch or 15-inch Color active matrix TFT Touch Panel as shown on the Drawings, or approved equivalent.

### PART 3 – EXECUTION

#### 3.1 INSTALLATION

- A. Programmable controller shall be installed per manufacturer's recommendations.
- B. Programmable controllers shall be located within the MCP. The PLC, processor racks and power supplies shall be grounded to meet the manufacturer's specifications and installation recommendations.
- C. All field wiring shall terminate at terminal blocks within the PLC enclosure.
- D. All terminals and wires shall be uniquely numbered and labeled for easy identification. Numbers shall match those identified in wiring diagrams.
- E. All panel construction shall meet the requirements of Section 13420- Control System Equipment Panels and Racks.

#### 3.2 TESTING

- A. All testing shall be completed in accordance with Specification Section 13320 – Instrumentation and Controls.
- B. The Contractor shall perform onsite operability tests and system acceptance tests; and coordinate this work with the Application Engineer.

#### 3.3 TRAINING

- A. Provide eight (8) hours of training on PLC, power supply, and I/O module maintenance, replacement, and troubleshooting.

#### 3.4 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after

startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.

- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents
- C. Warranties: Submit a written warranty, executed by the manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period

### 3.5 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 13200

## SECTION 13201

### DISINFECTION OF WATER SYSTEMS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0, and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. Related Sections include the following:
  - 1. Division 0 – Bidding and Contract Requirements
  - 2. Division 1 – General Requirements
  - 3. Division 2 – Site Construction
  - 4. Division 11 – Equipment
  - 5. Division 13 – Special Construction

##### 1.3 REFERENCES

- A. The following is a list of standards that may be referenced in this section:
  - 1. American Water Works Association (AWWA):
    - i. B300, Hypochlorites.
    - ii. B301, Liquid Chlorine.
    - iii. B302, Ammonium Sulfate.
    - iv. B303, Sodium Chlorite.
    - v. C651, Disinfecting Water Mains.
    - vi. C652, Disinfection of Water Storage Facilities.
    - vii. C653, Disinfection of Water Treatment Plants.
    - viii. C654, Disinfection of Wells.
  - 2. Standard Methods for the Examination of Water and Wastewater, as published by American Public Health Association, American Water Works Association, and the Water Environment Federation.

##### 1.4 SUBMITTALS

- A. Submit in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein.

B. Submittals:

1. Plan describing and illustrating conformance to appropriate AWWA standards and this Specification.
2. Procedure and plan for cleaning systems.
3. Procedures and plans for disinfection and testing.
4. Proposed locations within system where samples will be taken.
5. Type of disinfecting solution and method of preparation.
6. Certification that employees working with concentrated chlorine solutions or gas have received appropriate safety training.
7. Method of disposal for highly chlorinated disinfecting water.
8. Independent Test Agency: Certification that testing agency is qualified to perform chlorine concentration testing and bacteriological testing in accordance with AWWA standards, agency requirements, and this Specification.

1.5 QUALIFICATIONS

- A. Independent Testing Agency: Certified in the State of Massachusetts, with 10 years' experience in field of water sampling and testing. Agency shall use calibrated testing instruments and equipment, and documented standard procedures for performing specified testing.

PART 2 – PRODUCTS

2.1 WATER FOR DISINFECTION AND TESTING

- A. Clean, uncontaminated, and potable.
- B. The Contractor shall coordinate with the Owner before any public water is used. The Contractor will be responsible for all associated fees and charges for water use and compliance with conditions and/or restrictions associated with the use of public water from the Owner. Contractor shall convey in disinfected pipelines or containers to site.

2.2 CONTRACTOR'S EQUIPMENT

- A. Furnish chemicals and equipment, such as pumps and hoses, to accomplish disinfection.
- B. Water used to fill pipeline may be supplied using a temporary connection to existing distribution system. Provide protection against cross-connections as required by AWWA C651.

## PART 3 – EXECUTION

### 3.1 GENERAL

- A. Conform to AWWA C651 for pipes and pipelines, C652 for tanks and reservoirs, C653 for water treatment plants and filters, and C654 for wells, except as modified in these Specifications.
- B. Disinfect the following items installed or modified under this Project, intended to hold, transport, or otherwise contact potable water:
  - 1. Pumps:
    - i. Well Station 2 Raw Water Pumps (P-100A, P-100B)
    - ii. Well Station 3 Raw Water Pump (P-141)
    - iii. WTP Finished Water Pumps (P-700A, P-700B, P-700C)
    - iv. WTP Recycle Pumps (P-800A, P-800B)
    - v. WTP Sludge Pumps (P-801A, P-801B)
  - 2. Tanks:
    - i. Finished Water Wet Well
    - ii. Backwash Waste Tanks (3 compartments)
  - 3. Pressure Filters
  - 4. Wells:
    - i. Eight production wells at Well Station 2
    - ii. Well 3
  - 5. Pipelines: Disinfect new pipelines that connect to existing pipelines up to point of connection.
  - 6. Disinfect surfaces of materials that will contact finished water, both during and following construction, using one of the methods described in AWWA C652 and C653. Disinfect prior to contact with finished water. Take care to avoid recontamination following disinfection.
- C. Prior to application of disinfectants, clean pumps, tanks, filters, and pipelines of loosed and suspended materials.
- D. Allow freshwater and disinfectant solution to flow into pipe or vessel at a measured rate so chlorine-water solution is at specified strength. Do not place concentrated liquid commercial disinfectant in pipeline or other facilities to be disinfected before it is filled with water.

### 3.2 SEQUENCING AND SCHEDULING

- A. Commence initial disinfection after completion of following:

1. Completion and acceptance of internal painting of system(s).
2. Hydrostatic and pneumatic testing, pressure testing, functional and performance testing and acceptance of pipelines, pumping systems, structures, and equipment.
3. Disinfection of:
  - i. Pumps and associated system piping.
  - ii. Treatment plant basins and processes used to supply water to system.

### 3.3 PIPING AND PIPELINES

- A. Piping, valves, and those items contacting process water shall be disinfected as specified under AWWA Standards C651 – Disinfecting Water Mains, latest version. Refer to Section 02615 – Ductile Iron Pipe and Fittings.
  1. Before disinfecting, clean all foreign matter from pipe in accordance with AWWA C651.

### 3.4 WELLS

- A. Wells shall be disinfected as specified under AWWA Standards C654 – Disinfection of Wells, latest version.
  1. Contractor shall complete all requirements of AWWA Standard C654, Section 4.5 Chlorination of Well after permanent equipment is installed.
  2. Refer to Contract Drawings for additional requirements.

### 3.5 PUMPS

- A. Disinfecting Solutions: Minimum free chlorine concentration of 100 ppm.
- B. Application:
  1. Inject disinfecting solution into pump and associated piping and circulate for a minimum 3-hour period of time. At end of 3-hour period, solution shall have a strength of at least 50 ppm free chlorine.
  2. Operate valves and pump appurtenances during disinfection to ensure that disinfecting solution is dispersed into all parts of pump and lines.
  3. Disinfecting solution contained in pump has a residual free chlorine concentration less than 50 ppm after the 3-hour retention period, re-clean pump, reapply disinfecting solution, and retest until a satisfactory test result is obtained.
  4. After chlorination, flush water from pump until water through the unit chemically and bacteriologically equal to permanent source of supply.

### 3.6 TANKS AND RESERVOIRS

A. Cleaning:

1. Clean interior surfaces using water under pressure before sterilizing. Isolate tanks from system to prevent contaminating materials from entering the distribution system. Cleaning shall:
    - i. Remove all deposits of foreign nature.
    - ii. Remove all biological growths.
    - iii. Clean the slopes, walls, top, and bottom.
    - iv. Avoid damage to the structure.
    - v. Avoid pollution or oil deposits by workers and equipment.
  2. Dispose of water used in cleaning in accordance with applicable regulations before adding disinfecting solution to tanks.
- B. Disinfecting Procedure: In accordance with AWWA C652, unless herein modified. Parts of structures, such as ceilings or overflows that cannot be immersed, shall be spray or brush disinfected.

3.7 FILTERS

- A. Prior to disinfection, remove foreign material from filtration structures. Clean using fire hoses and tools suitable for adequate scrubbing and cleaning. Pump or drain scrub water from structures.
- B. Disinfection Procedure: In accordance with AWWA C653, unless herein modified.
- C. Disinfect the underdrain. Do not disinfect GreensandPlus™, Granular Activated Carbon, or Ion Exchange media.
- D. Clean other new facilities designed to hold or transport process water prior to disinfection of filter system including filter influent piping, and filter effluent piping.

3.8 DISPOSAL OF HEAVILY CHLORINATED WATER

- A. Do not allow flow into a waterway without neutralizing disinfectant residual.
- B. See the appendix of AWWA C651 for acceptable neutralization methods.

3.9 TESTING

- A. Collection of Samples:
1. Coordinate activities to allow samples to be taken in accordance with this Specification and Contract Drawings.
  2. Provide valves at sampling points.
  3. Provide access to sampling points.

B. Test Equipment:

1. Clean containers and equipment used in sampling and make sure they are free of contamination.
2. Obtain sampling bottles with instructions for handling from an independent testing laboratory.

C. Chlorine Concentration Sampling and Analysis:

1. Collect and analyze samples in accordance with AWWA C651.
2. Sampling Frequency for Disinfecting Solution: 2 samples per hour.
3. Residual Free Chlorine Samples: 2 samples per hour.
4. Dechlorinated Disinfecting Wastewater Residual Samples: 1 sample.
5. Sampling Locations: As required to meet this Specification and accepted by Engineer.
6. Analysis to be performed by an independent test laboratory. Samples will be analyzed using amperometric titration method for free chlorine as described in latest edition of Standard methods for Examination of Water and Wastewater.

D. After tanks, filters, pumps, and pipelines have been cleaned, disinfected, and refilled with potable water, an independent laboratory will take water samples and have them analyzed for conformance to bacterial limitations for public drinking water supplies.

1. Samples shall be collected in accordance with applicable AWWA Standard.
2. Samples shall be analyzed for coliform concentrations in accordance with latest edition of Standard Methods for the Examination of Water and Wastewater.
3. A minimum of two samples on each of 2 consecutive days from each separable structure and every 1,000 feet of pipeline shall be obtained and analyzed by standard procedures outlined by state and local regulatory agencies.
4. Sampling points shall be representative and accepted by Engineer.

E. If minimum samples required above are bacterially positive, disinfecting procedures and bacteriological testing shall be repeated until bacterial limits are met.

### 3.10 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 13201

## SECTION 13215

### CHEMICAL STORAGE TANKS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0, and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this section of the Specifications includes the following:
  - 1. The Contractor shall furnish all labor, materials, equipment, and incidentals required to install, field test, certify, complete, and make ready for service chemical storage tanks as shown on the Contract Drawings as specified herein.
- B. Related Sections include the following:
  - 1. Division 0 – Bidding and Contract Requirements
  - 2. Division 1 – General Requirements
  - 3. Division 11 – Equipment
  - 4. Division 13 – Special Construction

##### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of the Contract and Division 1 Specification Sections and as specified herein:
  - 1. The Contractor shall submit shop drawings to the Engineer showing details of construction and erection for each tank as follows:
    - i. Dimensions of tank, fittings and attachments, with bolt and gasket material.
    - ii. Wall thicknesses.
    - iii. Wall thickness calculations for each tank (bulk tanks and day tanks over 50 gallons only).
    - iv. Locations of fittings and attachments and size of manway and instrument openings.
    - v. Resin used.
    - vi. Weight of tank and any auxiliary equipment.
    - vii. Installation list of tanks with similar applications.
    - viii. Instructions for handling, storage, and installation of tanks.
    - ix. Statement that the high density cross-linked PE tanks are designed and manufactured in accordance with ASTM Designation D1998, Type I.

- x. Corrosion data for all materials in contact with the chemicals.
  - xi. Certificate of Compliance from the tank manufacturer for each tank stating:
    - a. All dome fittings and manway covers are vapor tight.
    - b. All fittings and appurtenances have been installed by the tank manufacturer.
    - c. H2O tests have been performed by the manufacturer and all fittings were installed prior to H2O tests.
    - d. The tank materials of construction are suitable for the intended chemical storage application.
- B. Operating and Maintenance Manuals: Equipment manuals shall be supplied with all tanks and shall give detailed, descriptive instruction on external piping procedures, accessory installation and use, and general tank use guidelines. Tank Installation and Use Instructions booklet shall be supplied. Refer to Section 01730 – Operation and Maintenance Data for additional requirements.

#### 1.4 QUALITY ASSURANCE

- A. The materials and equipment covered in this specification are intended to be standard materials and equipment of proven ability as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations and these Specifications. The Specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.
- B. Provide in accordance with Section 01400 – Quality Assurance and as specified.
- C. Consideration shall be given to only those manufacturers regularly engaged in the successful design, manufacture, and installation of storage tanks of the size and character herein specified for a period of not less than ten (10) years in similar applications. These locations must be provided where the tank can be visibly inspected. All tanks and appurtenances shall be supplied by one tank manufacturer.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Provide in accordance with Section 01610 – Delivery, Storage, and Handling.

#### 1.6 COORDINATION

- A. Coordinate with trades and other equipment to the fullest extent possible, particularly with respect to concrete structures and insets required.
- B. Provide an efficient, well-coordinated arrangement without conflict or sacrifice of design.

## 1.7 SYSTEM DESCRIPTION

- A. Potassium Hydroxide Bulk Storage Tank: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 45% potassium hydroxide. The HDXLPE tank shall be vertical, cylindrical, flat bottom, dome top. Bulk storage tank shall have a flanged outlet to achieve full drain. Tank shall be graduated for visual measurement of tank volume.
- B. Sodium Hypochlorite Bulk Storage Tank: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 12.5% sodium hypochlorite. The HDXLPE tank shall be vertical, cylindrical, flat bottom, dome top. Bulk storage tank shall have a flanged outlet to achieve full drain. Tank shall be graduated for visual measurement of tank volume. Tanks shall be molded with an oxidation resistant barrier with 4x the anti-oxidant.
- C. Sodium Bisulfite Bulk Storage Tank: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 38% sodium bisulfite. The HDXLPE tank shall be vertical, cylindrical, flat bottom, dome top. Bulk storage tank shall have a flanged outlet to achieve full drain. Tank shall be graduated for visual measurement of tank volume. Tank shall be molded with an oxidation resistant barrier with 4x the anti-oxidant.
- D. Potassium Hydroxide Day Tanks: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 45% potassium hydroxide. The tanks shall be flat bottom, cylindrical with a tight fitting cover. A threaded inspection hatch shall be provided on the cover. Tank shall be graduated for visual measurement of tank volume.
- E. Sodium Hypochlorite Day Tanks: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 6.25% sodium hypochlorite. The tanks shall be flat bottom, cylindrical with a tight fitting cover. A threaded inspection hatch shall be provided on the cover. Tank shall be graduated for visual measurement of tank volume.
- F. Sodium Bisulfite Day Tanks: High-density cross-linked polyethylene (HDXLPE) shall be used for storage of 38% sodium bisulfite. The tanks shall be flat bottom, cylindrical with a tight fitting cover. A threaded inspection hatch shall be provided on the cover. Tank shall be graduated for visual measurement of tank volume.
- G. Fluoride Saturator and Overflow Assembly: Rugged polyethylene (PE) shall be used for storage of 4% fluoride and backup overflow assembly. The tanks shall be open top, flat bottom, cylindrical tanks. The saturator shall have a tight fitting, hinged opening cover. The overflow tank shall have a tight fitting cover. Tanks shall be graduated for visual measurement of tank volume. The fluoride saturator and overflow system shall be provided with a disc water meter, 6 vane distributor assembly, cover mounted flow switch, remote mounted solenoid valve, control box, float shutoff valve, and siphon breaker. The fluoride saturator and overflow system shall be a 55 gallon Fluoro-HD Saturator with associated Overflow Assembly as manufactured by JP Plastics, Inc. or Engineer approved equal.

- H. Items under this Section include, but are not limited to, the following components and appurtenances: tanks, manways, ladders, fittings, supports, tank pads, tank stands, and associated appurtenances.

## PART 2 – PRODUCTS

### 2.1 EQUIPMENT SUPPLIER

- A. Storage Tank Manufacturer shall act as a single source for all components and shall accept entire system responsibility.
- B. The equipment covered by these specifications shall be standard equipment of proven ability as supplied by reputable suppliers having a long experience in the production of such equipment.
- C. Available Suppliers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to, the following:
1. Bulk Storage Tanks:
    - i. Poly Processing Company (<http://www.polyprocessing.com/>)
    - ii. Assmann Corporation (<http://www.assmann-usa.com/>)
    - iii. Terracon Corporation (<http://www.terracontanks.com/>)
    - iv. or Engineer approved equal
  2. Day Tanks:
    - i. Poly Processing Company: (<http://www.polyprocessing.com/>)
    - ii. Chem-Tainer Industries (<http://www.chemtainer.com/>)
    - iii. LMI Milton Roy (<https://www.lmi-pumps.com/>)
    - iv. Northeast Fluid Control, Inc (<http://www.nefluid.com>)
    - v. or Engineer approved equal
  3. Fluoride Saturator and Overflow Assembly:
    - i. JP Plastics Inc. (<http://www.maltzsales.com/>)
    - ii. Northeast Pump and Instrument Co. (<http://www.npipump.com>)
    - iii. LMI Milton Roy (<https://www.lmi-pumps.com/>)
    - iv. or Engineer approved equal
  4. Note: The chemical tank drawings are based upon Poly Processing Company and JP Plastics, Inc tank designs. Any proposed “OR EQUAL” chemical storage tank suppliers work includes any necessary re-design, revised piping/equipment/wiring, etc., at no additional costs to the Owner.

### 2.2 DESCRIPTION OF EQUIPMENT

- A. The Manufacturer shall be responsible for design and supply of tank supports and anchors, additional requirements described herein.

B. All tanks shall be provided with labels per MassDEP requirements.

C. Chemical storage tank schedule:

CHEMICAL STORAGE TANK SCHEDULE

<i>Equipment Description</i>	<i>Tag</i>	<i>Chemical Specific Gravity</i>	<i>Capacity (gal)</i>	<i>Dimensions *</i>	<i>Material</i>
Potassium Hydroxide Bulk Storage Tank	BT-500	1.30	3,000	7'-1" dia. 11'-11 3/4" height	HDXLPE
Sodium Hypochlorite Bulk Storage Tank	BT-400	1.20	905	64'-0" dia. 66'-0" height	HDXLPE
Sodium Bisulfite Bulk Storage Tank	BT-600	1.30-1.37	1,150	5'-4" dia. 8'-6" height	HDXLPE
Potassium Hydroxide Day Tank	DT-501	1.30	230	3'-2" dia. 4'-10 3/4" height	HDXLPE
Sodium Hypochlorite Day Tank (Pre-Filtration)	DT-401	1.20	70	1'-11" dia. 4'-1" height	HDXLPE
Sodium Hypochlorite Day Tank (Post-Filtration)	DT-402	1.20	30	1'-11" dia. 2'-1 1/4" height	HDXLPE
Sodium Bisulfite Day Tank	DT-601	1.30-1.37	30	1'-11" dia. 2'-1 1/4" height	HDXLPE
Fluoride Saturator	SAT-650		55		PE

\* Dimensions for reference only. Prior to submittal all dimensions shall be verified with available room, door, and building clearances.

2.3 BULK STORAGE TANKS

- A. Plastic: The tanks shall be molded from Grade I cross-linked polyethylene. The molding powder used shall be Paxon 7004, as manufactured by Exxon/Mobil Chemical, or powders of equal physical and chemical properties. The tank shall be suitable for each chemical application. Sodium hypochlorite bulk storage tank shall be molded with an oxidation resistant barrier with 4x the anti-oxidant.
- B. Fillers and Pigments: The plastic shall not contain any fillers. All plastic shall contain a long term U.V. stabilizer. Pigments may be added as desired by customer or as designated by tank manufacturer, not to exceed 0.5% of dry blended or 2 percent if melt compound of the total weight of the tank.

- C. The high density cross-linked polyethylene storage tanks shall be as manufactured in accordance with the definitions given in ASTM Designation D-1998 Type I. The tanks shall be manufactured by the rotational molding process.
- D. The minimum for the properties of the material shall be as follows, based on molded parts:

<b>Test Procedure</b>	<b>Units</b>	<b>Value</b>
Density /ASTM D-1505	g/cc	0.943-0.946
Tensile Strength at Yield/ASTM D-638	MPa (psi)	22.7 (3,290)
Elongation at Break (%)/ASTM D-638	%	> 640
Environmental Stress Crack Resistance/ASTM D-1693	hrs.	F <sub>0</sub> > 2,000
Impact Strength (-40 °C)/ARM	joules (ft-lb)	96 (71)
Heat Deflection Temperature, 66 psi/ ASTM D-648	°C (°F)	69 (157)

- E. The tanks shall be designed with a hoop stress value of no greater than 600 psi at 100 °F, with a safety factor of no less than two (2), using the Barlow Formula for calculating wall thickness. Wall thickness shall be designed for 1.90 Specific Gravity.
- F. All edges cut out for manway or other openings shall be trimmed to have smooth edges.
- G. The finished surface shall be as free as commercially practical from visual defects such as foreign inclusions, air bubbles, pinholes and craters.
- H. The tank diameter shall be measured externally (the reason for this variance in wall thickness to handle different weight materials). Tolerance on the outside diameter, including out of roundness, shall be +/- 1 percent. Measurement shall be taken in a vertical position. The knuckle radius at bottom to wall shall be a minimum of one (1) inch.
- I. At a minimum, the tank shall be rated for the specific gravity of the chemical intended for storage.
- J. Accessories:
1. Ladders:
    - i. Rigid ladders shall be provided on each bulk chemical tank as shown on the Contract Drawings.
    - ii. Ladders conform to the requirements of OSHA 29 CFR Part 1910.27, Fixed Ladder.

- iii. Ladder rungs to be nonskid fiberglass on one-foot centers and a minimum of two feet wide.
2. Refer to Contract Drawings for the location and sizes of fittings. Contractor and Manufacturer shall coordinate location and size of fittings with Engineer approved piping layouts. All tank fittings shall be shop installed prior to shipment.
3. Dome Fittings: All dome fittings shall be two-flanged Universal Ball Dome style. The flange attached to the tank wall shall be 150 Lb. ANSI and constructed of PVC. Bolts shall be chemically compatible. Each bolt shall have a ¼-inch EPDM gasket which is on the inside of the tank, and each flange shall have a ¼-inch EPDM gasket on the outside of the tank. All dome fittings shall be fume tight. All dome fittings shall have PVC flange adapters and be 150 Lb. ANSI. All pipe connections shall have a union fitting within one foot of the connection point.
4. Sidewall Overflows: All sidewall outlets shall be bolted flanged fittings. The flange attached to the tank wall shall be 150 Lb. ANSI and constructed of PVC. Bolts shall be chemically compatible. Each bolt shall have a ¼-inch EPDM gasket which is on the inside of the tank, and each flange shall have a ¼-inch EPDM gasket on the outside of the tank. All fittings shall be liquid tight. Overflow pipe shall provide for full volume of tank using interior overflow piping.
5. Flexible Connections/Expansion Joints: Flexible connections shall be provided for each lower sidewall fitting, as show on the Contract Drawings. Flex connections shall be true union PVC design with EPDM tube bellows and EPDM O-ring seals. Flex connections shall be designed to allow for expansion and contraction of tank without applying stress to the piping system. Joint shall be installed after the tank shut-off valve prior to the first pipe support.
6. Integrally Molded Flanged Outlet (IMFO): The bulk storage tank shall include an IMFO. The IMFO shall be located at the bottom of the sidewall and allow the tank to be fully drained. The IMFO shall be integrally molded into the tank during the molding process. The IMFO shall be seamless, flanged, and manufactured from the same material as the tank. Inserts are not acceptable. A PVC companion flange assembly with a split back-up ring, bolts, and gasket shall be provided.
7. Tank Pads: All bulk storage tanks shall be supplied with the associated IMFO tank pad or a custom tank pad with a footprint equivalent to the tank diameter. The pads shall be a minimum of 4” thick and shall be constructed of grade I high-density cross-linked polyethylene (HDXLPE) suitable for each chemical application.

## 2.4 DAY TANKS

- A. All day tanks shall be vertical, cylindrical, and flat bottom tanks. The tanks shall be molded from High Density Polyethylene and all tank materials shall be chemically compatible with the service. Tanks shall have a threaded inspection hatch.
- B. At a minimum, the tank shall be rated for the specific gravity of the chemical intended for storage.

### C. Accessories

1. Refer to Contract Drawings for the location and sizes of fittings. All piping connections to the tank shall have a union fitting within one foot of the connection point. Contractor and Manufacturer shall coordinate location and size of fittings with Engineer approved piping layouts.
2. Connections on the top of the tank shall be welded half couplings for fill, vent, level, and as required. Connections on the side and bottom tank shall be welded-gusseted flanged. Bolts shall be PVC. All fittings shall be liquid tight. Gussets shall extend to the outside edge of the ANSI flange and give full support to the pipe stub and flange.
3. Inspection Hatch: All chemical day tanks shall include a threaded inspection hatch.
4. All day tanks shall be provided with external, visible graduations.
5. All day tanks shall be provided with a freestanding polyethylene tank stand suitable of supporting the combined weight of the tank and chemical. Tank stands shall be provided with minimum of four (4) tie down tabs. Tank stands shall be provided by the tank manufacturer or shall be poured concrete. Day tank stands shall be 4-inches tall.

## 2.5 INSPECTION AND TEST PROCEDURES

- A. Test samples shall be taken from the manway cut out area or where fittings are inserted in each tank.
- B. Impact Test: Shall be performed (bulk tank only) in accordance with ASTM Designation D746.
  - 1/8" < test sample < 1/4" shall not shatter at  $-20^{\circ}\text{F}$  at 90 ft. lbs.
  - 1/4" < test sample < 1/2" shall not shatter at  $-20^{\circ}\text{F}$  at 100 ft. lbs.
  - 1/2" < test sample < 3/4" shall not shatter at  $-20^{\circ}\text{F}$  at 150 ft. lbs.
  - 3/4" < test sample shall not shatter at  $-20^{\circ}\text{F}$  at 200 ft. lbs.
- C. Degree of Cross-linking Test: ASTM Designation D2765 as modified by Phillips PTC Report 193 shall be used in this test. A minimum of 60 percent gel must be obtained.
- D. Hydrostatic Test: Each tank shall be filled with water and checked for leaks.
- E. Spark test the day tank connections.
- F. A certified certificate of compliance must be provided by the Manufacturer for impact tests, degree of cross-linking, hydrostatic tests, and spark tests prior to installation of the tanks.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. The Contractor shall furnish and install the tanks in accordance with the Contract Drawings and the manufacturer's instructions.
- B. The Contractor shall furnish and install the process piping in such a manner that allows the tank to expand and contract when filled and drained. Rigid piping must not be used. All piping must be supported.
- C. Upon successful completion of the field test, tanks and support members shall be anchored in their final position according to the Manufacturer's recommendations.

### 3.2 WARRANTY

- A. The complete system shall be warranted to be free from defects in material and workmanship under normal and proper use and service, for a period of one (1) year after startup and acceptance by the Owner. The Contractor shall provide all labor and materials to repair or replace any defective warranted items specified in this section.
- B. This warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made under the requirements of the Contract Documents.
- C. Warranties: Submit a written warranty, executed by the Manufacturer of the equipment and the Contractor, agreeing to repair or replace components of the equipment that fail in materials or workmanship within the specified warranty period.

### 3.3 FIELD TESTING

- A. After installation, each tank shall be field tested by filling with water. The tank and fittings shall hold water without loss, evidence of weeping or capillary action for a period of 24 hours prior to acceptance. Dispose of water in accordance with requirements of the Contract Documents.
- B. Submit field test results and certification of successfully conducted field tests.
- C. All field testing to be witnessed by the Engineer in the field.

### 3.4 CLEANING

- A. After installation is complete and piping connections made, remove all debris from tank and piping systems.

### 3.5 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.

END OF SECTION 13215

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 13320

### INSTRUMENTATION AND CONTROLS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:
  - 1. It is the intent and requirement of this project to have an instrumentation and control system integrator/supplier (ICSI/S or Integrator) responsible to the Contractor and an instrumentation and control system integrator (Application Engineer) responsible to the Town of Sharon (Owner) and Engineer.
  - 2. The Integrator shall complete all the work covered under this Section of the Specifications, including: furnishing all plant, labor, equipment, instruments, devices, appliances, hardware, software, accessories, incidentals and materials, and in performing all operations in connection with the furnishing, installation, calibration, testing, certification, and training of all instruments, equipment, devices associated with the process instrumentation and control systems, complete in place, in accordance with the Specifications and Drawings.
  - 3. Integrator responsibilities: The Integrator shall be responsible to the Contractor for satisfactory design detail of a complete coordinated system; and calibration services.
  - 4. Application Engineer responsibilities: The Application Engineer shall be responsible to the Owner and Engineer for integration with the Owner's existing drinking water system facilities; SCADA and PLC programming; start-up; testing; ongoing operation of the Owner's existing drinking water facilities; training; and on-site quality assurance.
  - 5. All work provided by the Integrator shall be done in harmony with the Contractor, Contractor's sub-contractors, Engineer, Owner, Application Engineer, and Owner's existing SCADA system.
  - 6. The Owner's existing SCADA system may not be interrupted under any circumstances – NO EXCEPTIONS.

7. All work shall be done in accordance with the National Electric Code, National Electric Safety Code, Occupational Safety and Health Administration, Underwriters Laboratories, Inc., International Society of Measurement and Control, National Electric Manufacturers Association, and all other state and local codes.

B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements
2. Division 1 – General Requirements
3. Division 11 – Equipment
4. Division 13 – Special Construction
5. Division 15 – Mechanical
6. Division 16 – Electrical

C. Work included:

1. The Contractor shall be responsible for the following:
  - i. Providing the services of an instrumentation and control system integrator/supplier (ICSI/S or Integrator) who shall furnish and install all of the equipment, instruments, devices, and materials described and specified in this Section.
  - ii. Furnishing a complete and fully operational system. The Drawings and Specifications are intended to include all details of a complete equipment installation, but do not purport to cover all details entered into the design of the complete system. The Contractor shall be responsible for all details which may be necessary to properly install, adjust, and place in operation the complete installation. The Contractor shall assume full responsibility for additional costs which may result from unauthorized deviations or substitutions from the specifications and all requirements necessary to integrate the new systems with the Owner's existing system. An inspection of the Owner's existing SCADA and I&C systems is strongly encouraged during the bid phase.
  - iii. Installation of all mechanical instrumentation furnished under this Contract.
  - iv. The Contractor shall not furnish separate equipment and attempt to assemble a system. This work is to be performed by a qualified control systems company as approved by the Engineer.
2. The Integrator shall be responsible for the following:
  - i. Well Stations 2, 3, and 4  
Furnishing and installing all appurtenant materials, including specialty cables, connectors, tubing, and necessary mounting and accessory equipment

to provide a complete operating system. All equipment shall be furnished as indicated on the Contract Drawings and specified herein, or as required to ensure proper system functioning;

Furnishing all panels and panel components specified herein and in Division 13 specifications. Prefabrication of all panel assemblies;

Integration of all equipment and instrumentation meant for SCADA control and monitoring as specified under this Contract;

Connection of fiber cables to the network switch at Well Station 4;

Integration of the new fiber telemetry and existing radio telemetry at Well Station 4;

Integration of existing radio telemetry at Well Stations 2 and 3;

All selective demolition and salvage work as shown in the Contract Drawings; and

Coordination with the Application Engineer for programming and control.

ii. Wells 2, 3, and 4 Water Treatment Plant

Furnishing and installing all appurtenant materials, including specialty cables, connectors, tubing, and necessary mounting and accessory equipment to provide a complete operating system. All equipment shall be furnished as indicated on the Drawings and specified herein, or as required to ensure proper system functioning;

Furnish all panels and panel components specified herein and in Division 13 specifications. Prefabrication of all panel assemblies;

Integration of all equipment and instrumentation meant for SCADA control and monitoring as specified under this Contract;

Connection of fiber cables to the network switch;

Integration of the new fiber telemetry and existing radio telemetry;

Coordination with the Application Engineer for programming and control; and

Coordination with the Iron and Manganese Filter Manufacturer for the filtration system controls.

iii. Remote Site Radios

Furnish 14 radios, lightning protection, and appurtenances to the Owner for installation by the Application Engineer at the Town's water system facilities.

- iv. The Integrator shall be available for consultation and provide direction during mechanical installation of instrumentation furnished under this Contract and during installation of conduit, raceways, power supplies, wiring, and terminations associated with instrumentation furnished under this Contract but installed by others.

D. Work not included:

1. Integration with the Owner's existing drinking water system facilities; programming; ongoing operation of the Owner's existing drinking water facilities shall be covered under the Application Engineer's scope of work.
2. Installation of radio modems and lightning protection devices at each of the Owner's existing water system facilities shall be covered under the Application Engineer's scope of work.
3. Installation of process equipment, pumps, piping, valves, fittings, and appurtenances shall be covered under Division 11.
4. Providing control panels to be provided under Division 11.
5. Electrical conduit, wiring, raceways, relays, starters, motor control centers, and variable speed drives, etc., required for operation of the equipment shall be furnished and installed by the Electrical Contractor under Division 16 of these specifications.
6. Power connections for all electrical devices and panels furnished under this Section, including connections or disconnections to power supplies, shall be furnished and installed by the Electrical Contractor under Division 16. Electrical terminations of signal wiring from applicable field devices/equipment furnished under Division 11, Division 13, Division 15, and Division 16 within the cabinets furnished and installed in this Section shall be made by the Electrical Contractor as directed by the Integrator. Fiber connections for all fiber-Ethernet network switches provided under this Section shall be furnished and installed by the Electrical Contractor under Division 16 as directed by the Integrator.

### 1.3 REFERENCE STANDARDS

- A. Publications are referred to in the text by basic designation only. Where a date is given for reference standards, that edition shall be used. Where no date is given for a reference standard, the latest edition in effect at the time of bidding shall apply.
- B. American Petroleum Institute (API)
- C. International Society of Measurement and Control (formerly Instrument Society of America)
  1. ISA S5.4, Instrument Loop Diagrams

2. ISA S20, Specification Forms for Process Measurement and Control Instruments, Primary Elements and Control Valves.
  3. ISA RP60.3, Human Engineering for Control Centers
  4. ISA RP60.6, Nameplates, Labels, and Tags for Control Centers
- D. National Electric Manufactures Association (NEMA)
- E. National Fire Protection Agency (NFPA)
- F. Underwriters Laboratories, Inc. (UL)
- G. American Society for Testing and Materials (ASTM)

#### 1.4 QUALIFICATIONS OF INSTRUMENTATION & CONTROL SYSTEM INTEGRATOR

- A. The evaluation of qualifications of each Instrumentation and Control System Integrator will be in accordance with the following requirements, as determined by the Engineer:
1. Responsiveness to each of the specific requirements, both technical and contractual.
  2. Documentation that demonstrates the Instrumentation and Control System Integrator is both financially and technically capable of providing and implementing the instrumentation and control system, as specified.
  3. The Instrumentation and Control System Integrator shall have a staffed field service department with full-time service technicians. Service technicians shall be in the direct employ of the Instrumentation and Control System Integrator, not a sub-contractor, capable of performing detailed engineering, coordination, drafting, procurement, scheduling, inspection, programming, calibration, and testing of equipment supplied. Qualification summaries and resumes of staff shall be submitted upon request.
  4. The Instrumentation and Control System Integrator shall provide a list of at least seven (7) currently operating installations that use communications, and control systems similar to the one specified for this project.
  5. The Instrumentation and Control System Integrator shall provide documentation that they have built and placed into service at least 5 systems of similar scope within the past 60 months.
  6. The final decision regarding the acceptance of the qualifications for the Instrumentation and Control System Integrator shall be that of the Engineer. Therefore, it is imperative that the Bidder understand the Contractor qualifications for the Instrumentation and Control System Integrator set forth herein, prior to submitting a Bid for this project.

7. The following Instrumentation and Control System Integrators have been pre-qualified for this project:
  - i. R. E. Erickson, Co., Inc.  
591-A Providence Highway  
Walpole, MA 02081  
508-668-9330
  - ii. Elm Electrical, Inc.  
68 Union Street  
Westfield, MA 01085  
413-562-0905
  - iii. Harbor Controls Inc.  
85 Commerce Park Rd  
North Kingstown, RI, 02852  
401-667-0930

## 1.5 SUBMITTALS

A. The Integrator shall submit the following in accordance with Section 01300.

1. Qualifications Submittal: Within 15 days of the Contract Award the Contractor shall submit detailed information associated with the Integrator to be subcontracted for the project. The information shall include project references from five (5) water/wastewater projects of similar complexity (including contact information for prior projects, resumes of staff to be participating in this project, and location of staff responsible for responding to the site within four hours to resolve start-up issues). The project descriptions and references shall include an approximate value of the project and contact information (Engineer and Owner). The information shall clearly demonstrate compliance with paragraph 1.4 of this Section. The Qualifications submittal shall be submitted to the Engineer, reviewed, and approved before any further Instrumentation, Control, or SCADA system submittals will be accepted by the Engineer. Failure to meet the minimum requirements of this Section shall be grounds for rejection as an acceptable Integrator. If the Contractor's proposed Integrator is rejected, a new Integrator shall be proposed by the Contract until the Integrator is deemed to be qualified by the Engineer.
2. Project Plan and Schedule: a Project Plan and Schedule submittal shall be submitted within 60 calendar days of the Contract Award. This submittal must be reviewed and approved by the Engineer before any further Instrumentation, Control, or SCADA system submittals will be accepted by the Engineer, and shall, as a minimum, contain the following:
  - i. Overview of the proposed system.
  - ii. A summary of conformance of the equipment supplied with the specifications and identification of any substitutions or deviations.

- iii. Summary of Integrators approach to the work, including integration with existing SCADA system.
  - iv. Plan and approach to installation, testing, calibrating, and training.
  - v. Implementation schedule that includes: equipment purchase, manufacturing, delivery, installation, testing, start-up, calibration, training, and certificate of installation.
  - vi. Project personnel and organization chart for each task to be completed: design, installation, testing, calibration, and training.
  - vii. Proposed list of submittals including specific contents of each submittal.
  - viii. Project milestones and anticipated meeting dates with Filter Manufacturer for filter programming.
3. Hardware, Panel Drawings, and Loop Drawings: the Integrator shall submit a single all-inclusive package as detailed herein. The submittal shall contain a job index sheet for all equipment, materials, and devices to be furnished, and a detailed table of contents for the submittal package. At a minimum, the submittal shall include the following.
- i. A complete system architecture diagram showing in schematic form, the interconnections between major hardware components including control centers, panels, power supplies, consoles, computer and peripheral devices, network equipment, PLCs, PLC I/O modules, OIT, and like equipment. The system architecture diagram shall be complete and shall depict all required cables, details on connection requirements, network modules, switches, communication modules, port numbers, and rack slot numbers. The intent of this submittal is for the Integrator to develop a diagram that is complete in every aspect to allow purchase of all required equipment by part number, and to allow a qualified technician to interconnect all equipment without having to refer to additional manuals or literature. The system architecture diagram shall be provided on 11 x 17 inch paper and may be shown on multiple sheets.
  - ii. Component specifications, manufacturer's descriptive literature, shop drawings, and ISA-S20 data sheets for all devices/equipment being furnished. The information shall clearly indicate all pertinent design data for the Engineer to evaluate conformance with the specifications. Devices shall reference the tagging convention used in the Design Documents.
  - iii. Submit certified calibration data for all flow metering devices.
  - iv. Submit UPS system sizing calculations listing all connected and anticipated loads, battery backup times, and spare capacity.
  - v. Component drawings showing dimensions, mounting and external connection details including external piping and/or wiring for all field and pipeline mounted equipment.
  - vi. Panel Drawings: Where panels are furnished, provide: bill of materials drawings listing each panel component; fabrication and nameplate legend drawings; internal wiring and piping schematic drawings clearly showing all equipment, terminal, and bulkhead numbers; conduit access locations; panel construction details; fabrication and painting specifications (including color); panel layout drawing showing the location of each

device/component; panel wiring diagram showing all signal and power connections. Wiring diagrams to show all wire sizes, numbers, wire colors, and terminal block numbers. The drawings shall be drawn to scale and detail all equipment in and on the panel.

Loop Drawings: The Integrator shall submit detailed loop diagrams for each analog and digital loop in compliance with ISA-S5.4 format. Loop drawings shall include the location of each device using a minimum of three areas (field, back of panel, front of panel), and shall show all intermediate wiring locations such as junction boxes or field termination panels. Drawings shall reflect actual wire numbers, terminal block numbers, and equipment/device tag IDs. Loop drawings shall be submitted on 11 x 17 inch paper folded to 8.5 x 11 inches.

4. Testing Plan: The Integrator shall submit a detailed testing plan describing the method and procedure for testing each loop. The procedure shall include checkoff/signoff sheets/forms for each component/device for: tag identification, installation, wiring, tubing, calibration, adjustments, and space for comments. The procedure shall include checkoff/signoff sheets/forms for each loop including panel interface terminations, I/O interface terminations, I/O signal operation, total loop operation, and space for comments. For each analog device, calibration and testing sheets shall be provided to document calibration and testing results including: scale ranges, functions, modes, interlocks, required and actual I/O signals at 25%, 50%, 75%, and 100%, and space for comments. After completion of the system installation and testing, submit a written certification that the system installation has been completed as specified, and to the satisfaction of the Integrator. The testing plan shall meet the requirements of Part 3 of this Section.
5. Training Plan: The Integrator shall submit an outline of the proposed training to be provided to the Owner's personnel. Training shall be directed to the different needs of various users of the system. At a minimum, training programs shall be developed for the following areas: basic hardware and equipment operation; system maintenance; system calibration; and basic troubleshooting. The training plan shall meet the requirements of Part 3 of this Section.
6. Final System Documentation: After approval of the system, submit six complete bound sets of final documentation manuals. The manuals shall be submitted in 3-ring binders, maximum size of 3-inches, with drawings reduced to 11 x 17 inch, then folded to 8.5 x 11 inch for inclusion. Each section shall be uniquely numbered and separated by a binder tab. At a minimum, the submittal shall contain the following:
  - i. Table of Contents
  - ii. An instrument and equipment list for all devices supplied including tag numbers, manufacturer's model number, range, span, set points, manufacturer, manufacturer's telephone number, local supplier name and telephone number.
  - iii. An ISA S20 data sheet for every type of device and equipment supplied.
  - iv. Detailed service, maintenance, and operation instructions for each

- device/instrument supplied.
- v. Complete as-built panel drawings, wiring diagrams, loop diagrams, and system architecture schematic.
- vi. The cover and edge of each volume shall contain the Owner's name, project name, Integrator name, date, volume number, and number of volumes.

## 1.6 QUALITY ASSURANCE

- A. The materials and equipment covered in this specification are intended to be standard materials and equipment of proven ability as manufactured by reputable concerns. The control and monitoring system shall be designed and constructed in accordance with the best practice of the industry and shall be installed in accordance with the manufacturer's recommendations and these Specifications. The Specifications call attention to certain features but do not purport to cover all details entering into the design and installation of the Instrumentation and Control system. The Contractor shall be responsible for furnishing and installing any necessary peripheral devices required to achieve a fully functioning Instrumentation and Control system as described herein.

## 1.7 WARRANTY

- A. Contractor shall provide an equipment manufacturer's guarantee that the materials and/or workmanship of the equipment be free from defects for a period of one year from date of the Engineer's Letter of Substantial Completion.
- B. The Contractor shall provide, at the time of start-up, a letter certifying that the equipment has been installed properly, calibrated and is in working order suitable for operation.

## 1.8 DELIVERY, STORAGE, AND HANDLING

- A. Control, delivery, storage, and handling of equipment in accordance with Sections 01600 and 01610.

## 1.9 COORDINATION

- A. The Contractor's attention is directed to the fact that the instrumentation is an integrated system which shall be furnished by one supplier who shall provide all of the equipment and appurtenances regardless of manufacturer. Substitutions of functions specified will be unacceptable.
- B. The final I&C system shall be fully compatible and functional with existing and new systems.
- C. Coordination with Iron and Manganese Filter Manufacturer for the filtration system controls.
- D. Coordination with the Application Engineer for PLC and HMI programming and configuration.

## 1.10 OPERATION AND MAINTENANCE DATA

- A. Furnish Operations and Maintenance Instruction Manuals (O&M Manuals) prior to start-up.
- B. Submit under provisions of this Section.
- C. Operation Data: Description of operating procedures.
- D. Maintenance Data: Description of servicing procedures; list of major components, recommended remedial and preventive maintenance procedures; and recommended spare parts list for each product furnished under this section.
- E. Manuals shall be published by the Manufacturer and shall be of the most recent publication date.
- F. Refer to Specification Section 01730 –Operations and Maintenance Data for additional requirements.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. All of the equipment shall be of the manufacturer's latest, most modern proven design and shall, as far as practical, be of one manufacturer. Overall system and component accuracy shall be as guaranteed by the specific manufacturer.
- B. All instrumentation and electronic equipment shall be UL approved and of the manufacturer's latest proven design, utilizing printed circuitry and epoxy coating (or equal) to prevent contamination by dust, moisture, and fungus. First generation equipment with less than three years general use shall have documentation on construction, operation, field testing, and user list.
- C. All equipment shall be suitable for operation in the environment of the project. Solid state components shall be conservatively rated for their purpose, to provide reliable (>90%) performance over ambient atmospheric temperature between 0 to 140 degrees Fahrenheit and 0 to 95 percent relative humidity. All indoor control panel- located electronics shall be suitable for operation in ambient temperatures of 40 degrees F to 120 degrees F. All field electronics and outdoor panel equipment shall be suitable for operation in ambient temperatures of -40 degrees F to 140 degrees F.
- D. All electronic instrumentation shall be of the solid state type and shall utilize linear transmission signals (to and from) of isolated 4 to 20 mA DC (milliampere direct current); however, distribution within a panel or cabinet may use variable voltage (1-5 VDC – volts direct current).
- E. Outputs of equipment that are not of the standard signals outlines above shall have the output immediately raised and/or converted to compatible standard signals for remote transmission. No zero based signals shall be allowed.
- F. All electronic/digital equipment shall be provided with radio frequency interference protection.

- G. All transmitter output signals shall include signal and power source isolation boosting (as required).
- H. All receiving devices and field instruments when operating in a loop shall be of a design such that a failure of an individual device shall not affect the operation and integrity of the remaining functions or devices. All instruments and devices, either remote or panel mounted, shall have an individual, internal on-off switch.
- I. All signal converters, isolation transformers, power regulators, power converters, fuses, switches, relays, integrators, computing devices, alarm trips, and related equipment required by the instrument manufacturers and necessary to complete the functional requirements described in the loop descriptions and shown on the drawings shall be furnished and installed by the Integrator. All instruments and devices requiring an external power supply shall have an internal on-off switch.
- J. All electronic transmitting equipment shall provide loop power. True 2-wire transmitters may have loop power supplied in the receiving instrument if available or by a plug-in power supply mounted in the receiving instrument panel. A separate and isolated power supply for each device within a loop shall be supplied.
- K. All instruments and equipment shall be provided with suitable mounting hardware, floor stands, wall brackets, and instrumentation racks.
- L. All instrument air and fluid fittings and valves necessary for the operation of instruments shall be suitable and compatible for the process fluids being contacted.
- M. Nameplates (equipment tags) shall be provided on all field-mounted instruments. Nameplates shall be constructed of stainless steel. Nameplates shall be a minimum of 1.5" long times 0.75" high with 3/16" stamped letter height. Wording shall be the equipment tag id. Nameplates shall be attached to the instruments using stainless steel screws or a stainless steel wire/band passing through a hole in the tag and secured to the instrument.
- N. The INSTRUMENT LOOP DESCRIPTIONS (SECTION 13465), PROCESS & INSTRUMENTATION DRAWINGS, CONTROL SYSTEM EQUIPMENT PANELS AND RACKS (SECTION 13420), AND PROCESS AND INSTRUMENTATION CONTROL PRODUCTS (SECTION 13325) indicate the intent of the process and interconnection between EQUIPMENT, INSTRUMENTATION & CONTROL PRODUCTS, INSTRUMENTS, AND DEVICES. EQUIPMENT specified in Division 11 and Division 13 does not purport to cover all equipment which may be required to complete the process intent. The equipment specified herein does not include all of the required equipment and devices necessary for a completely operational system. The Integrator shall provide all necessary equipment required to perform the function for the system.

## 2.2 ELECTRICAL

- A. Equipment shall operate on the 60 Hertz alternating current power source at a nominal 120 volts, plus or minus 10%, except where specifically noted. Where possible, all field instruments shall be 24 VDC loop powered. Regulators and power supplies required for compliance with the above shall be provided between power supply and interconnected instrument loop. Where equipment requires voltage regulation, constant voltage transformers shall be supplied.
- B. All switches shall have double-pole, double-throw contacts rated at a minimum of 600 VA, unless specified elsewhere.
- C. All materials shall be UL listed and approved.
- D. Equipment shall be constructed (or configured) so that when a power interruption occurs, the equipment, instrument, and/or device resumes normal operation without manual resetting when power is restored, unless otherwise noted.
- E. All conductors running from the field to control panels shall be of a single, continuous length, without splices, except at approved junction boxes. Special care shall be exercised to carry grounding lines through such junction boxes with the least possible resistance. Multi-conductor cable may be used between junction boxes and control panels.
- F. All shielded cable shall be grounded at the control panel end only. Shields shall be carried through junction boxes with the least possible resistance and kept isolated from ground at these points. The field end of the shield shall be insulated to prevent grounding.
- G. All external connection points shall be made at terminal blocks with No 6-32 or larger screws.

## 2.3 EQUIPMENT

- A. Refer to Computers and Miscellaneous Equipment (13100), Programmable Logic Controllers (13200), Control System Equipment Panels and Racks (Section 13420), and Instrumentation Control Products (Section 13325).
- B. Radio Modems
  - 1. Radio modems shall be Viper SC+100 IP Router or approved equal. The radio modem shall operate with a 10 to 30 VDC power supply. All radio modems shall be configurable as the master station, repeater, or remote radio. All radios shall be capable of redundancy, be robust and designed for data transmission, FCC approved, and UL listed. All radios shall have a 1-year Manufacturer's warranty.
  - 2. The radio modem shall be configurable for operation between 150 to 174 MHz. The radio modem will include an Ethernet 10/100 Base RJ45 connector, serial connector, and antenna connector. The radio modem will

include an LED light to indicate Power, Status, Ethernet Activity, Ethernet Link, and Receive/Transmit

3. Each radio modem shall be provided with a mounting shelf, connectors, and jumper cables.

#### C. Lightning Protection

1. Radio system surge protection shall be rated for 100-700 MHz service and shall be manufactured by Polyphaser, or approved equal.

### 2.1 CONTROL PANELS, ENCLOSURES, CABINETS

- A. Refer to Control System Equipment Panels and Racks (Section 13420).

### 2.2 MISCELLANEOUS EQUIPMENT

#### A. Spare Parts

1. Spare parts shall be provided as a part of the start-up services during the initial start-up and phase-in period. These items shall include accessories such as fuses, electrodes, membranes, fluids, charts, ink, lights, etc. required to start-up and operate the system for a period of 60 days. These items shall be packaged in separate containers and shipped to the job site with the instruments and shall be tagged "INSTRUMENT START-UP EQUIPMENT."
2. Spare parts and accessories above and beyond those being provided for start-up services shall be provided under this Section. All spare parts shall be packaged and shipped at one time. Separate shipment of spare parts shall not be acceptable. The Engineer shall be notified of the shipment release in writing indicating that all items have been shipped. Each item shall be checked by the Engineer as being received and that all components have been provided as specified.
3. A one year supply of consumables and replacement parts required for all instruments and devices being furnished for the system. A list of spare part to be included in the one year supply of consumables and replacement parts shall be provided to the engineer during the shop drawing approval stage. Consumables and replacement parts shall be those over and above that which have been specifically identified in this section.
4. At a minimum, spare parts shall consist of the following:
  - i. Six (6) of each type of fuse (per panel)
  - ii. Two (2) of each type of relay (per panel)
  - iii. Six (6) of each type of replaceable indicator lamp (per panel)
  - iv. One (1) of each type of UPS
  - v. One (1) of each type of power supply (per panel)

## PART 3 – EXECUTION

### 3.1 PRODUCT HANDLING

- A. Special instructions for proper field handling and installation required by the manufacturer for proper protection shall be securely attached to each piece of equipment prior to shipment.
- B. Each package shall be tagged to identify its location, tag number, and function in the system. Identification shall be prominently displayed on the outside of the package.
- C. A permanent stainless steel or other non-corrosive material tag firmly attached and permanently and indelibly marked with the instrument tag number, as given in the tabulation, shall be provided on each piece of equipment supplied under this Section.
- D. Equipment shall not be stored out-of-doors. Equipment shall be stored in dry, heated, permanent shelters and, including in-line equipment, shall be adequately protected against mechanical injury. If any apparatus has been damaged, such damage shall be repaired or the damaged equipment replaced by the Contractor at his/her own cost and expense. If any apparatus has been subject to possible exposure or injury by water, it shall be thoroughly dried out and put through such tests as directed by the Engineer. This shall be at the cost and expense of the Contractor, or the apparatus shall be replaced by the Contractor at his/her own expense.

### 3.2 INSTALLATION

- A. Instrumentation and accessory equipment shall be installed in accordance with the best field and shop practices.
- B. The workmanship shall be in accordance with the best field and shop practices for the instrument and control systems.
- C. All workmen shall be skilled in the work to which they are assigned, and all work shall be performed under an instrumentation foreman. The instrumentation foreman shall be identified to the Engineer prior to construction and installation.
- D. All wiring and piping shall be constructed perfectly plumb, square, level, and true to lines and surfaces indicated, in a neat, substantial and workmanlike manner, and in such a way as to properly serve for the purpose intended. All members and parts, upon installation, shall be properly framed, secured together, and anchored in place. All cuts shall be deburred and immediately cleaned from the opposite end before connecting.
- E. All instruments shall be mounted, piped and connected in strict accordance with the manufacturer's instructions. All wall mounted panels shall be mounted 5 feet above the floor, as measured to the center of the panel, or as directed by the Engineer.
- F. All internal wiring of the panels shall be done by the panel manufacturer in accordance with the drawings, and instrument manufacturer's instructions.

- G. The instrument specifications indicate the intent of the interconnections between process equipment and the type of individual instrument. The proposed equipment shall be complete with all mounting hardware and accessories to satisfy the functional requirements.
- H. All work shall be executed in full accordance with codes and local rulings. Should any work be performed contrary to said rulings, ordinances, and regulations, the Contractor shall bear full responsibility for such violations and assume all costs arising there from.
- I. All piping to and from field instrumentation shall be provided with necessary unions, test tees, and shut-offs.
- J. Interfacing fixtures shall be compatible with the equipment to which they are attached and shall comply with the applicable specifications.
- K. Coordination with the process and equipment in addition to standard quoted fixtures required to conform the instrumentation to the process shall be the responsibility of the Contractor. The instrument and control system supplier shall provide detailed information on the fixtures being supplied and the extent of the field installation required.
- L. Brackets and hangers required for mounting of equipment shall be provided as noted and/or as required. The brackets and hangers shall be installed in a workmanlike manner and shall not interfere with any other equipment. Devices shall be resistant to corrosion from acids, bases, and oxidants, and applicable to the environment for which they are being installed.
- M. Investigate each space in the building through which equipment must pass to reach its final location. If necessary, the manufacturer shall be required to ship his/her material in sections sized to permit passing through such restricted areas in the building.
- N. The shield on each process instrumentation cable shall be grounded as directed by the manufacturer of the instrumentation equipment, but in no case shall more than one ground be employed for each shield.
- O. Maximum practical separation shall be maintained between signal (analog alarm, and status) conduits and power feeders and AC systems.
- P. All field conductors shall terminate at the panel terminal board. Millivolt signal wires (i.e., thermocouple) may be connected direct to the input terminals of the receiving instrument if so specified.
- Q. All signal wire terminations to field equipment and panel terminal strips shall be covered under Division 16, with coordination from the Integrator. Power feed terminations shall be covered under Division 16, with coordination from the Integrator. All fiber terminations at fiber-Ethernet network switches shall be covered under Division 16, with coordination from the Integrator.

- R. All wire ends shall be terminated with hook fork type non-split compression lugs.
- S. All wire ends shall be identified at both ends with wire markers.
- T. Installation of fiber optic cable within control panels and console assemblies shall refer to cable manufacturer's specifications for bend radius. Use cable breakout assembly as recommended by the cable manufacturer. Provide basket, strain relief as required to meet manufacturer's strain requirements.
- U. Clean and prepare surfaces on which signs and tags will be mounted prior to installation.
- V. Entry to field enclosures shall be through the back, side, or bottom (not top) with weatherproof hubs. Wiring shall enter near the terminal point and not obstruct access to removal of components.
- W. Lifting rings shall be removed from cabinets/assemblies. Hole plugs of the same color as the cabinet shall be provided and installed for the holes.

### 3.3 FACTORY TESTS

- A. The Integrator shall test all equipment at the factory prior to shipment. Unless otherwise specified, all equipment provided by the Integrator shall be tested at the factory as a single fully integrated system.
- B. At a minimum, the testing shall include the following:
  - 1. Unwitnessed Factory Test (UFT)
  - 2. Witnessed Factory Tests (WFT)
  - 3. Application Software Test (AST)
- C. Each test shall be in the cause and effect format. The person(s) conducting the tests shall initiate an input (cause) and upon the system's or subsystem's producing the correct result (effect), the specific test requirement will have been satisfied.
- D. All tests shall be conducted in accordance with prior Engineer approved procedures, forms, and checklists. Each specific test to be performed shall be described and a space provided after it for sign off by the appropriate party after its satisfactory completion.
- E. Copies of these sign off test procedures, forms and checklists will constitute the required test documentation.
- F. The Integrator shall provide all special testing materials and equipment, including all interconnecting wires and cables between equipment to be tested, required to conduct testing in accordance with these specifications. Wherever possible, perform tests

using actual process variables, equipment, and data. Provide a suitable means of simulation when it is not practical to test with real process variables, equipment, and data. Simulation tests and techniques must be clearly identified and described in the test procedures.

- G. The Integrator shall coordinate all testing with the Contractor, Application Engineer, and Engineer.
- H. The Engineer reserves the right to test or retest all specified functions whether or not explicitly stated in the prior approved Test Procedures without additional cost.
- I. The Engineer's decision shall be final regarding the acceptability and completeness of all testing.
- J. No equipment shall be shipped until the Engineer has received all test results and approved that the system is ready for shipment.
- K. Unwitnessed Factory Tests (UFT)
  - 1. The entire system except for primary elements and final control elements shall be interconnected and tested to ensure the system will operate as specified. All analog and discrete input/output points not interconnected at this time shall be simulated to ensure proper operation of monitoring devices/functions and control devices/functions. The intent is for the Integrator to verify functionality of all components (e g., 100 percent I/O check to the interface terminal blocks) prior to the Application Engineer loading the PLC and OIT software.
  - 2. All panels, consoles and assemblies shall be inspected and tested to verify that they are in conformance with related submittals, specifications and drawings. During the tests all digital system hardware shall be operated for at least five days continuously trouble free to verify the system is capable of continuous operation
  - 3. Provide all temporary cables including fiber optic, Ethernet, CAT5e, and CAT6e necessary to connect all control system components including network and PLC control system communication modules and cables for use during factory testing.
  - 4. Provide test documentation as specified herein.
- L. Witnessed Factory Test (WFT)
  - 1. The Integrator shall notify the Engineer in writing that the system is ready for the WFT and allow the Engineer to schedule a test date within 21 days of receipt of the "Ready To Test" letter. At the time of notification, the Integrator shall submit any revisions to the detailed test procedure previously approved by the Engineer in the project system plan.
  - 2. Prior to start of the WFT, all previous unwitnessed test results shall have been submitted and approved by the Engineer.

3. Implicit in the scheduling of the WFT is the assumption that the Integrator has determined through prior, unwitnessed tests and quality assurance programs that the equipment is ready for shipment.
4. The following documentation shall be made available to the Engineer at the test site both before and during the WFT:
  - i. All drawings and specifications addenda and change orders.
  - ii. Master copy of the test procedure.
  - iii. List of the equipment to be tested including make, model, and serial number.
  - iv. Design related hardware and non-Owner supplied software submittal applicable to the equipment being tested.
5. All system tests specified for the UFT shall be repeated. All temporary cabling provided during the UFT shall be provided for the WFT.
  - i. Perform a 100 percent check of all I/O to the interface terminal blocks and verification of all communications networks. I/O verification includes testing each analog signal at zero, ten, fifty, ninety, and one hundred percent, and each digital signal at zero and one hundred percent of range.
  - ii. Test the functionality of each selector switch and push button.
  - iii. Test the functionality of each indicator light and annunciator point.
  - iv. Confirm accurate signaling at each analog indicator, recorder, and controller at zero, ten, fifty, ninety, and one hundred percent of range.
  - v. Test each computer to ensure system boots correctly, allows access to all system components including hard drives, disk drives, CD ROM drives, and communications networks.
  - vi. The Integrator and Engineer shall jointly test each communications network link using an Engineer approved Integrator test configuration to verify successful completion of required communications paths including: sending data to and receiving data from a PLC (PC to PLC communications and OIT to PLC communications), sending data to and receiving data from another PLC (PLC to PLC communications), sending data to and receiving data from another PC (PC to PC communications and PC to OIT communications), and sending data to all printers.
  - vii. Test the UPS systems to verify ability to carry the associated load during a power failure for a minimum of 15 minutes.
6. All control panels shall be included in these tests.
7. All deficiencies identified during these tests shall be corrected and retested prior to completion of the WFT as determined by the Engineer.
8. All test data and procedure followed during testing shall be logged, and certified copies of the logs shall be provided to the Engineer.
9. All "punch list" items or deficiencies identified during the WFT shall be corrected by the Integrator prior to starting the AST.

M. Application Software Test (AST).

1. After completion of the WFT, the Engineer shall have unrestricted access to the entire PLC system to verify the functionality of the PLC programs and OIT application software.
2. Normal access to the system shall be from 7:00 a.m. to 4:00 p.m., Monday through Friday. The Application Engineer shall provide additional access time to the system when the Engineer provides 48 hours' notice.
3. The Engineer agrees to complete their required testing "as rapidly as possible" to minimize the disruption of the Integrator's installation schedule and other day to day activities. The Contractor, Integrator, and Application Engineer shall include a minimum of two (2) weeks for the Engineer to complete the AST. The Integrator shall include in their schedule sufficient time to accommodate this extended staging time.
4. The Integrator shall provide and reinstall all necessary power, cables, communications equipment, etc., to interconnect all the PLC and OIT system components as shown on the Contract Drawings. This requirement includes all necessary communications hardware, software, PLC cables and connectors, Ethernet, fiber optic, and CAT6e cables, telephone lines, etc.
5. During the entire AST all panels and OIT equipment shall be powered fully and interconnected per the approved Integrator system architecture drawing and ready for testing. Additionally, all equipment shall be arranged to allow convenient and safe access by the Engineer.
6. During the entire AST, the Engineer shall have reasonable access to Integrator facilities including a minimum of free parking, restrooms, drinking water, telephone, and internet service. The Engineer shall be responsible for all of their long distance telephone charges, refreshments, and meals.
7. The Integrator shall provide copies of all shop drawings, PLC and OIT manufacturer's literature, one large table (approximately 4 foot by 8 foot for staging the OIT equipment and for Engineer working space), and two padded office style chairs. In addition, the Integrator shall supply access to a minimum of two 120 VAC, 20 amp, single phase power outlets.

3.4 FIELD TESTS

- A. Prior to final field connections to any of the instrument panels, the Contractor shall clean all work completed including the interior of all panels; and remove all dirt, trash, wire clippings, and foreign material. The outside of all instrument panelboards are to be cleaned, and damaged painted surfaces touched up as required to leave the equipment in an acceptable condition. This shall include all nameplates, tags, and identification of equipment and devices within or on the front of the panels.
- B. No form of energy shall be turned on to any part of the instrumentation system prior

to receipt by the Engineer of a certified statement of approval of the installation from the Contractor containing his/her supplier's authorization for turning on energy to the system.

- C. It shall be the responsibility of the Integrator to provide a factory trained and qualified service person from the manufacturers' of the equipment to TEST AND CALIBRATE ALL EQUIPMENT and to INSTRUCT the Contractor on EQUIPMENT INSTALLATION and the ENGINEER and OWNER on operation of the equipment.
- D. No other instrumentation system manufacturer's personnel other than those persons directly from the service department of the manufacturer of the equipment and identified in the approved Project Plan shall be acceptable to perform field testing.
- E. All tests shall be conducted in accordance with prior Engineer approved procedures, forms and checklist. Each specific test to be performed shall be described and a space provided after it for sign off by the appropriate party after the satisfactory completion.
- F. Signed copies of the test procedures, forms and check lists will constitute the required test documentation.
- G. Provide all special testing materials, equipment, and devices. Wherever possible, perform tests using actual process variables, equipment, and data. Where it is not practical to test with real process variables, equipment and data, provide suitable means of simulation. Define these simulations techniques in the test procedures.
- H. At a minimum, field testing shall include the following:
  - 1. Operational Readiness Test (ORT)
  - 2. Application Software Operational Readiness Test (ASORT)
  - 3. Functional Acceptance Test (FAT).
- I. Each test shall be in the cause and effect format. The person conducting the test shall initiate an input (cause) and upon the system's or subsystem's producing the correct result (effect), the specific test requirement will have been satisfied. Implicit in these testing requirements is extensive coordination between the Integrator, Application Engineer, and Engineer. The Integrator is responsible for proving that the system functions in a manual mode without the aid of the PLC/OIT software. The Integrator is also responsible for verifying all I/O is connected correctly and providing valid readings at the PLC system. The Integrator and Application Engineer are also responsible for proving the automatic/remote functions that require PLC/OIT software.
- J. The Integrator and Application Engineer shall coordinate all testing with the Engineer.
- K. The Engineer reserves the right to test or retest all specified functions whether or not explicitly stated in the prior approved Test Procedures with no additional cost.

- L. The Engineer's decision shall be final regarding the acceptability and completeness of all testing.
- M. The Integrator shall furnish the services of field service engineers, all special calibration and test equipment and labor to perform the field tests.
- N. Operational Readiness Test (ORT)
  - 1. General: Prior to the Operational Readiness Test, the entire system shall be certified (inspected, tested, and documented) that it is ready for operation.
  - 2. Loop/Component Inspections and Tests: The entire system shall be checked for proper installation, calibrated and adjusted on a loop-by-loop and component-by-component basis by the Integrator following field installation to demonstrate and document that the system is in conformance with related submittals and these specifications.
  - 3. The Integrator shall maintain the Loop Status Reports and Component Calibration sheets at the jobsite and make them available to the Engineer at any time.
  - 4. The Engineer reserves the right to witness and sign off on all tests conducted by the Integrator. The Engineer will review and initial all Loop Status Sheets and Component Calibration Sheets and spot check their entries periodically and upon completion of the tests. Any deficiencies found shall be corrected. Final versions of these test sheets shall be submitted to the Engineer.
- O. Application Software Operational Readiness Test (ASORT)
  - 1. After completion of the Integrator's ORT, the Engineer shall have unrestricted access to the entire PLC system to verify the functionality of the PLC programs and OIT application. During the ASORT, the Integrator and Application Engineer shall be on site or available within 4 hours to make any necessary repairs or equipment calibrations.
  - 2. The Integrator shall include in their schedule sufficient time (5 calendar days) to accommodate this extended on site testing time.
  - 3. Implicit in the scheduling of the ASORT is the assumption that the Contractor and Integrator have determined through prior quality assurance programs and successful completion of the ORT (and other tests) that all I&C equipment (furnished by the Integrator and equipment supplied under other Divisions), including control panel assemblies, networking equipment, PLC systems, networks, instruments, analyzers and other ancillary equipment is completely operational and ready for the Engineer's use.
  - 4. During the entire ASORT, all panels and OIT equipment shall be powered fully and interconnected per the approved Integrator system architecture drawing, and ready for testing.
  - 5. The Integrator shall provide, or coordinate with the Contractor to provide, copies

of all approved shop drawings; copies of all as built drawings; PLC and OIT manufacturers literature; one large table (approximately 4 foot by 8 foot) and three padded office style chairs in a temperature controlled area.

6. The Engineer agrees to complete their required testing as rapidly as possible to minimize the disruption of the Integrator's installation schedule and other day to day activities.

P. Functional Acceptance Test (FAT)

1. Prior to the FAT, the entire installed instrument and control system shall be certified by the Contractor, Integrator, Application Engineer and Engineer that it is ready for operation. All preliminary testing, inspection, and calibration shall be complete and defined in the ORT and ASORT. The intent of the FAT is for all responsible parties, working together, to prove the installed system operates in accordance with the Specifications. Each party is responsible for verifying the completeness of all system components furnished, installed, configured by their respective firms or subcontractors.
2. Once the facility has been started up (as defined in 01650) and is operating, a witnessed FAT shall be performed on the complete system to demonstrate that it is operating and in compliance with these specifications. Each specified function shall be demonstrated on a paragraph by paragraph, loop by loop, and site by site basis.
3. Loop-specific and non-loop-specific tests shall be the same as specified under factory testing, WFT, and AST for all Integrator activities, except that the entire installed system shall be tested and all functions demonstrated. During testing, the Integrator, applicable manufacturer's representatives, Application Engineer and Engineer shall be present.
4. In the event of rejection of any part or function of an Integrator furnished system or equipment supplier's system, the Integrator (or supplier as applicable) shall perform repairs or replacement within 10 days.
5. Updated versions of the documentation specified to be provided for during the FAT shall be made available to the Engineer at the job site both before and during the tests. In addition, one copy of all O&M manuals shall be made available to the Engineer at the job sites both before and during testing.

### 3.5 START-UP/COMMISSIONING

- A. During the start-up and commissioning the Contractor shall provide sufficient personnel to aid with the start-up of the instrumentation and controls equipment to be provided and installed under this Contract. This shall include services to correct any faults and to make the necessary adjustments for the proper operation of the equipment and installation. No other instrumentation system manufacturer's personnel other than those persons directly from the service department of the manufacturer of the equipment and identified in the approved Project Plan shall be acceptable to

perform this work.

- B. After completion of the FAT, the Instrumentation and Control System shall be tested as a component of, and extension of, the Full System Demonstration Test (refer to Section 01650). In addition, all furnished hardware and software shall operate for a period of 14 consecutive days, under conditions of full plant process operation, without a single non field repairable malfunction.
- C. During the Full System Demonstration Test and extended 14-day period, the Integrator and Contractor shall have available, within 4 hours of notification; personnel who have an intimate knowledge of the hardware and software furnished and installed under this Contract.
- D. While this test is proceeding, the Contractor shall have full use of the system. Only Contractor operating personnel shall be allowed to operate equipment associated with live plant processes.
- E. Any malfunction of hardware and/or software furnished under this Contract during the tests shall be analyzed and corrected by the Integrator or equipment supplier's service technician. Any malfunction of software furnished under this Contract during the tests shall be analyzed and corrected by the Application Engineer or equipment supplier's service technician. The Engineer will determine whether any such malfunctions are sufficiently serious to warrant a repeat of this test.
- F. Any malfunction attributed to the Integrator during the Full System Demonstration Test (and 14-day period) which cannot be corrected within 24 hours of occurrence, or more than two similar failures of any duration, will be considered as a non-field repairable malfunction.

### 3.6 TRAINING

- A. The cost of training programs to be conducted with Town personnel shall be included in the Contract price. The training and instruction shall be directly related to the system being supplied. The Integrator is responsible for training associated with all hardware, including PLC system troubleshooting and repair. The Application Engineer is responsible for training associated with the PLC and OIT system software.
- B. The Integrator shall provide training in accordance with the approved training plans. The Integrator shall provide detailed manuals to supplement the training courses. The manuals shall include specific details of equipment supplied and operations specific to the project.
- C. The Integrator shall make use of teaching aids, manuals, slide/video presentations, etc. After the training services, such materials shall be delivered to Owner.
- D. The training program shall represent a comprehensive program covering all aspects of the operation and maintenance of the system hardware.
- E. All training schedules shall be coordinated with, and at the convenience of, the

Owner.

- F. The Integrator shall schedule their training to allow sufficient time in the project schedule to provide training on the PLC and OIT systems software. The exact details of the Integrator training will be coordinated with the Engineer during the submittal process, and approved by the Engineer.
- G. On site (field) training shall be conducted at the Owner's designated location and shall provide detailed hands on instruction to personnel covering: system debugging, troubleshooting, maintenance procedures, calibration procedures and system operation. The training shall run at times chosen by the Owner.
- H. The Contractor shall provide organized instrumentation and control systems training to be conducted by qualified manufacturer's service representatives for operations staff totaling no less than twenty-four (24) hours. Training will include equipment startup, operation, calibration, preventative maintenance, corrective maintenance, and trouble shooting. Contractor will provide the Engineer with a proposed training schedule and outline at least 14 days prior to the proposed dates of training. Content and schedule to be approved by the Engineer. Training will only be conducted for equipment that has been completely installed, tested, calibrated, and is in acceptable working order. Training on installed equipment that has not been adequately tested and calibrated will not be acceptable.
- I. The training shall be conducted over a period of six months as follows:
  - 1. Two (2) eight-hour work days: immediately after successful completion of the Functional Acceptance Test.
  - 2. One (1) eight-hour work day: three months after successful completion of the Full Scale Demonstration Test.
- J. Training days (and hours) do not have to be consecutive, however the total training time shall equal twenty four total hours as specified above. Contractor shall provide written verification to the engineer that all equipment is properly calibrated and in good working order prior to the beginning of TRAINING.

### 3.7 MANUFACTURER'S SERVICES

- A. The supervisory service of a factory-trained service engineer who is specifically trained on the type of equipment herein specified shall be provided for a period of not less than three (3) eight-hour days during construction to assist the Contractor in equipment installation; the location of sleeves; methods of installing conduit and special cable; mounting, piping, and wiring of one of each type of device; and the methods of protecting all of the equipment prior to placing it into service.
- B. Upon completion of the installation, the services of the above service engineer shall be provided for a period of not less than three (3) eight-hour days for calibration and testing as described in Section 3.4.

- C. Upon completion of the equipment calibration and testing, the services of the above service engineer shall be provided for a period of not less than twenty-four (24) hours for instruction and training as described in Section 3.6.

### 3.8 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 13320

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 13325

### PROCESS INSTRUMENTATION AND CONTROL PRODUCTS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

1. Process instrumentation and control products, instruments, devices, and accessories associated with Process Instrumentation and Control Systems.
2. The work covered under this Section of the Specifications includes furnishing all plant, labor, equipment, instruments, devices, appliances, hardware, software, accessories, incidentals and materials, and in performing all operations in connection with the furnishing, installation, calibration, testing, certification, and training of all instruments, equipment, devices associated with the process instrumentation and control systems, complete in place, in accordance with the Specifications and Drawings, by the instrumentation and control system integrator/supplier (Integrator) as specified in Section 13320.
3. All work provided by the Integrator shall be done in harmony with the Contractor, Contractor's sub-contractors, Application Engineer, Engineer, and Owner.
4. All work shall be done in accordance with the National Electric Code, National Electric Safety Code, Occupational Safety and Health Administration, Underwriters Laboratories, Inc., International Society of Measurement and Control, National Electric Manufacturers Association, and all other state and local codes.

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements
2. Division 1 – General Requirements
3. Division 11 – Equipment
4. Division 13 – Special Construction
5. Division 16 – Electrical

- C. Work not included:

1. Electrical conduit, relays, starters, motor control centers, and variable speed drives, etc., required for operation of the equipment shall be furnished and installed under Division 16 of these specifications.
2. All electrical devices furnished under this Section shall be installed under Division 16.
3. The power connections to all electrical devices furnished under this Section shall be performed under Division 16.
4. Installation of process equipment, pumps, piping, valves, fittings, and appurtenances shall be covered under Division 11.

### 1.3 SUBMITTALS

- A. Refer to Section 13320 – Instrumentation and Controls

### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. Control, delivery, storage, and handling of equipment in accordance with Sections 01600 and 01610.

### 1.5 OPERATION AND MAINTENANCE DATA

- A. Furnish Operations and Maintenance Instruction Manuals (O&M Manuals) prior to start-up.
- B. Submit under provisions of this Section.
- C. Operation Data: Description of operating procedures.
- D. Maintenance Data: Description of servicing procedures; list of major components, recommended remedial and preventive maintenance procedures; and recommended spare parts list for each product furnished under this section.
- E. Manuals shall be published by the Manufacturer and shall be of the most recent publication date.
- F. Refer to Specification Section 01730 – Operation and Maintenance Data for additional requirements.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. All instrumentation and electronic equipment shall be UL approved and of the manufacturer's latest proven design, utilizing printed circuitry and epoxy coating (or equal) to prevent contamination by dust, moisture and fungus. First generation equipment with less than three years general use shall have documentation on construction, operation, field test, and user list.

- B. All equipment and devices furnished hereunder shall be designed for continuous industrial service and shall be of modular construction capable of field expansion.
- C. All equipment shall be suitable for operation in the environment of the project. Solid state components shall be conservatively rated for their purpose, to provide reliable (>90%) performance over ambient atmospheric temperature between 0-140 degrees Fahrenheit and 0 to 95 percent relative humidity. All indoor control panel-located electronics shall be suitable for operation in ambient temperatures of 40 degrees F to 120 degrees F. All field electronics and outdoor panel equipment shall be suitable for operation in ambient temperatures of -40 degrees F to 140 degrees F.
- D. All electronic instrumentation shall utilize transmission signals (to and from) of isolated 4 to 20 mA DC, unless otherwise approved by the Engineer.
- E. All electronic/digital shall be provided with radio frequency interference protection.
- F. All transmitter output signals shall include signal and power source isolation and boosting (as required).
- G. Indicators, controllers, integrators, relays, and other receiving devices when operating in a loop shall be of a design such that a failure of an individual device shall not affect the operation and integrity of the remaining functions. All indicators, either remote or panel mounted, shall have an individual, internal on-off switch.
- H. Electronic transmitting equipment shall provide loop power. True 2-wire transmitter may have its loop power supplied in the receiving instrument if available or by a plug-in power supply mounted in the receiving instrument panel.
- I. All equipment necessary to complete the functional requirements shall be supplied by the systems supplier and shall be of the same manufacturer as the controllers, indicators, and recorders unless otherwise specified (e.g. signal converters, integrator, computing devices, alarm trips, etc.).
- J. All instruments and equipment shall be provided with suitable mounting hardware, floor stands, wall brackets, panel racks, and rails.
- K. All instrument air and fluid fittings and valves necessary for operations shall be suitable and compatible for the process fluids being contacted.
- L. All necessary fuses and switches required by the instrumentation manufacturer for his equipment shall be provided with the equipment. All instruments requiring an external power supply shall have an internal on/off switch.
- M. All conductors running from the field to control panels shall be of a single, continuous length, without splices, except at approved junction boxes. Special care shall be exercised to carry grounding lines through such junction boxes with the least possible resistance.
- N. Metal nameplates shall be provided on all field-mounted elements, indicators and transmitters. Wording and sizing of nameplates shall be as described in Section 13320.

O. Instrument Summary List:

SECTION	INSTRUMENTATION	TYPE
2.2	Flow	Electromagnetic Flow Meter Flow Switch*
2.3	Pressure	Pressure Indicating Transmitter Differential Pressure Indicating Transmitter
2.4	Level	Ultrasonic Level Propane Tank Level Septic Tank Float Switch Flood/Float Switch Well Level Level Switch
2.5	Analytical	pH Chlorine Residual Water Temperature
2.6	Temperature	Room Temperature Transmitter
2.7	Control Station	Metering Pump
2.8	Laboratory	Spectrophotometer pH Meter

\* - Furnished and installed under Division 15.

2.2 FLOW INSTRUMENTS

A. Electromagnetic Flow Meters

1. Flow Element

- i. Type: Flow meters shall be a pulsed, direct current (DC) type volumetric liquid flow rate detector. The process transducing method shall be such that the characteristics of the water being measured shall be used to generate an induced voltage as water passes through a magnetic field. The amplitude of the voltage produced shall be directly proportional to the flow rate. The flow meter description, tag number, nominal size, and flow range are presented in the Contract Drawings.
- ii. Performance: Accuracy – within +/- 0.5% of actual flow rate with absolute zero stability, requiring no zero adjustment; Repeatability - 0.1% of full scale; Power Requirements – match to converter/transmitter; Temperature rating – minus 4 to plus 140 degrees F; Pressure rating – 150 psi; Provide RFI protection; One pipe diameter upstream maximum and zero pipe diameter downstream maximum of straight run required for flow meter operation; Meter shall be capable of running empty indefinitely without damage to any component.
- iii. Physical: ANSI 150# RF flanged end connections, hard rubber liner (NSF 61 approved), Hastelloy C electrodes, 304 stainless steel measuring tube, steel SAE, epoxy paint finished housing, 316 stainless steel grounding rings, and die-cast terminal box, and built-in ultrasonic electrode cleaning features.
- iv. Accessories/Options Required: Provide a certified flow curve for each meter; provide ground ring, ground wires and gaskets, as required or as otherwise noted. All materials shall be immune to chemical reaction with liquid being measured. Where

insulated or non-conductive pipe is used, only orifice plate grounding rings will be acceptable.

- v. Flow meters must be approved for use in drinking water applications.

## 2. Signal Converter/Transmitter

- i. Type: Instrument or remote mounted, microprocessor based electronics w/ LCD display, matched to flow element.
  - ii. Performance: Power requirements - 120 VAC, +/- 10%; power consumption no greater than 15 VA; Temperature - minus 4 to plus 140 degrees F.; Output – Isolated 4-20mA into 0 to 1000 ohms; output signal linear and proportional to flow velocity, without requirement for signal characterizing; LCD indicator, totalizer, 10 Hz scaled pulse, and integral electronics.
  - iii. Physical: Housing – NEMA 4X wall mount, or integral with the device as approved by the Engineer.
  - iv. Accessories/Options Required: Signal converters shall be interchangeable without recalibration for all meter sizes; a separate terminal strip for power connection shall be supplied; empty pipe zero stabilization option; separate junction box for terminal connections; attached to electronics housing.
  - v. Remote transmitters required for the Fe/Mn filter influent flow meters (FIT-213A, FIT-213B, FIT-213C) and PFAS Filter influent flow meters (FIT-319A, FIT-319B, FIT-319C). All other electromagnetic flow meters to have instrument mounted transmitters (FIT-110, FIT-148, FIT-178, FIT-212, FIT-218, FIT-311, FIT-312, FIT-714A, FIT-714B, FIT-714C, FIT-812, FIT-813, FIT-814).
3. Manufacturer: All electromagnetic flow meters shall be Badger, the Town of Sharon has standardized on this electromagnetic flow meter. No exceptions shall be allowed.

## B. Flow Switches (FS-420, FS-421)

- 1. One flow switch shall be installed on the feed line to each emergency showers located in the KOH/NaOCl Containment area, which shall be used to indicate emergency shower usage.

## 2.3 PRESSURE INSTRUMENTS

- A. Pressure Indicating Transmitters (PIT-107, PIT-108A, PIT-108B, PIT-147, PIT-177, PIT-211, PIT-316A, PIT-316B, PIT-316C, PIT-317A, PIT-317B, PIT-317C, PIT-318, PIT-713A, PIT-713B, PIT-713C, PIT-817A, PIT-817B)
- 1. Type: Turret mount case with digital liquid crystal display and ¼” NPT connection. The description, tag number, nominal size, and pressure range are presented in the Contract Drawings.
  - 2. Performance/Functional: Gauge pressure range of 0 to 300 psi and an operating temperature range of -20 to 185 degrees F; Span limits - 10 and 300 psi. Transmitter accuracy of +0.25% of calibrated span and +0.1% repeatability of maximum span. Range is to be fully adjustable using allowable span and range limits.

3. Physical: All wetted parts shall be 316 stainless steel. Transmitters shall be 2 wire providing a 4-20 mA DC output signal with non-interacting zero and span adjustments. Units shall provide local indication of measured pressure with on-board configuration pushbuttons. Electric terminations shall be in a NEMA 4X enclosure provided with a terminal strip.
  4. Power Requirements: 24 VDC
  5. Accessories/Options: Provide with diaphragm seal constructed of materials compatible with drinking water applications. All necessary accessories required for installation and mounting shall be included.
  6. Manufacturer: Foxboro (IGP10); Siemens; Rosemount; or Engineer approved equal.
- B. Differential Pressure Indicating Transmitters (DPIT-214A, DPIT-214B, DPIT-214C, DPIT-215, DPIT-313A, DPIT-313B, DPIT-313C, DPIT-315A, DPIT-315B, DPIT-315C)
1. Type: Electronic variable capacitance; two-wire transmitter; “smart electronics”. Includes indicating transmitter with digital liquid crystal display, and three-valve manifold. The description, tag number, nominal size, and pressure range are presented in the Contract Drawings.
  2. Performance: Range is -30 to 30 psia; Maximum adjustable range – noted range shall be between 40% and 80% of the maximum adjustable range. Accuracy – plus or minus 0.075 percent of span. Temperature – operating range -20 degrees F to 150 degrees F, minimum.
  3. Physical/Features: Materials – all wetted parts including process flanges and drain vents/valves shall be 316 SS unless otherwise noted. Wetted O-rings: Glass filled TFE, graphite filled PTFE, or Viton unless otherwise noted. Damping – Fluid or electronic type with adjustment. Indicator – Four-digit LCD indicating the noted range. Suppressed or elevated zero when noted. Signal Interface – 4 to 20 mA DC output for load impedance of 0 to 500 ohms minimum; Digital process variable signal superimposed on 4 to 20 mA signal; support HART protocol type device.
  4. Power Requirements: 24V DC supply.
  5. Enclosure: NEMA 4X; Mounting – Pipe or wall as noted. Provide stainless steel brackets with stainless steel bolts. Housing – Modular with separate compartments for electronics.
  6. Three-valve manifold: Type 316 SS.
  7. Manufacturers: Siemens (SITRANS P320); Rosemount; Foxboro; or Engineer approved equal.

## 2.4 LEVEL INSTRUMENTS

### A. Ultrasonic Level Transducers and Transmitters

1. Type: Ultrasonic type level transducers and integral transmitters

2. Performance/Functional: Level monitoring system shall have a range of up to 50 feet with a resolution of +/- 0.1% of range and repeatability of +/- 25% of range.
3. Bulk Chemical Storage Tank Transducers (LE-411, LE-511, LE-611): All level transducers shall be coordinated with the tank height and equipped with chemical isolation diaphragms suitable for the chemical in use. The wiring from the transducer to the transmitter shall be housed in conduit. One monitor transmitter shall be used per transducer. Transducer materials of construction shall be compatible with the chemical service. Transducers shall be installed according to manufacturer recommendations.
4. Backwash Waste Tank and Finished Water Wetwell Transducers (LE-711, LE-811A, LE-811B, LE-811C): Fully submersible, self-cleaning, and able to be mounted without flanges. The wiring from the transducer to the transmitter shall be housed in conduit. One monitor transmitter shall be used per transducer. Transducers shall be installed according to manufacturer recommendations.
5. Bulk Chemical Storage Tank Monitors/Transmitters (LIT-411, LIT-511, LIT-611): Shall include a 4 x 1.5" multi-block LCD display with backlighting. Input: 4 to 20 mA from alternate device, scalable; Output: 4 to 20 mA for display at the bulk chemical fill panel (sodium hypochlorite, potassium hydroxide, and sodium hydroxide) and as an input to the SCADA system. The monitor/transmitter shall have two Form C dry contacts for each tank monitored. Transmitters shall be installed according to manufacturer recommendations.
6. Backwash Waste Tank and Finished Water Wetwell Monitors/Transmitters (LIT-711, LIT-811A, LIT-811B, LIT-811C): Shall include a 4 x 1.5" multi-block LCD display with backlighting. Input: 4 to 20 mA from alternate device, scalable; Output: 4 to 20 mA as an input to the SCADA system. The monitor/transmitter shall have two Form C dry contacts for each clearwell monitored. Transmitters shall be installed according to manufacturer recommendations.
7. Power Required: 12-30V DC supply.
8. Manufacturer: All ultrasonic type level transmitters shall be of the same manufacturer.
  - i. Bulk Chemical Storage Tank Transducers: Siemens (ST-H); Flowline; Emerson or Engineer approved equal.
  - ii. Bulk Chemical Storage Tank Monitors/Transmitters: Siemens (HydroRanger200); Siemens; Flowline; Emerson or Engineer approved equal.
  - iii. Backwash Waste Tank and Finished Water Wetwell Transducers: Siemens (XPS-10); Flowline; Emerson or Engineer approved equal.
  - iv. Backwash Waste Tank and Finished Water Wetwell Monitors/Transmitters: Siemens (HydroRanger200); Flowline; Emerson or Engineer approved equal.

#### B. Flood/Float Switches

1. Sump Pits (LSH-113, LSH-151, LSH-181, LSH-419, LSH-614, LSH-996)

- i. Direct-acting, normally open, mercury-free type float switch with polypropylene housing, slosh guard, and PVC-jacketed type SO cable of sufficient length. Chemical feed area flood switch housing shall be compatible with the chemical(s) in use. Float switch shall have two (2) Form C dry contacts.
  - ii. Manufacturer: Madison; ACT; SJE-Rhombus; or Engineer approved equal.
- 2. Chemical Bulk Storage and Day Tanks (LSH-412, LSH-413, LSH-416, LSH-512, LSH-513, LSH-612, LSH-613)
  - i. Environmentally safe, containing no mercury. Switches shall be float type with DPDT mechanical switches and provide Form C dry contacts. Housing for switches shall be suitable for and compatible with the chemical in use. Switches shall be installed at a height of 2-inches below the tank overflow elevation and shall be adjustable within a range of +/- 2-feet of the set point.
  - ii. Chemical tank level switches shall be supplied with cable weights. The level switches shall have a narrow angle of operation to ensure quicker alarming.
  - iii. Manufacturer: Flowline Switch-Pak (AV16-4247-A) or Engineer approved equal.
- 3. Backwash Waste Tank and Finish Water Wetwell (LSH-712A, LSL-712B, LSH-815A, LSL-816A, LSH-815B, LSL-816B, LSH-815C, LSL-816C)
  - i. Direct-acting, normally open, mercury-free type float switch with 316 stainless steel housing and PVC-jacketed type SO cable of sufficient length. Float switch shall have two (2) Form C dry contacts.
  - ii. Manufacturer: Madison; ACT; SJE-Rhombus; or Engineer approved equal.
- 4. Tight Tank (LSH-971, LSH-972)
  - i. Direct-acting, normally open, mercury-free type float switch with 316 stainless steel housing and PVC-jacketed type SO cable of sufficient length. Float switch shall have two (2) Form C dry contacts.
  - ii. Manufacturer: Madison; ACT; SJE-Rhombus; or Engineer approved equal.

#### C. Level Transducer

- 1. Well Level Transducer (LE-146, LE-176)
  - i. Well level transducer shall be submersible type that measures level through hydro static head pressure. Transducer shall be suitable for groundwater well applications with a watertight integrity of up to 15000 psi.
  - ii. Transducer shall be provided with 200-foot cable.
  - iii. Transducer shall be less than 3/4" diameter and constructed of 316 stainless steel. Power and signal cable shall be encapsulated in polyurethane. Provide stainless steel transducer mounting attachment to pump sole plate.
  - iv. Power Requirements: Loop Powered.
  - v. Internal circuitry shall provide lightning protection and shall provide a 4-20 mA output signal.
  - vi. Transducer shall be physically compatible within 1" PVC conduit, as shown on the Contract drawings.

- vii. The well level transducer shall be manufactured by Esterline Technologies Corporation model KPSI Level Transducer, Flowline, Dwyer, or Engineer approved equal.

## 2.5 ANALYTICAL INSTRUMENTS

- A. Each sample stream shall have a single analyzer assembly shall be preassembled by the manufacturer/supplier on a fiberglass backer board as shown on the Contract Drawings.
- B. Analyzer Filters – All Sample Streams
  - 1. There shall be two 10” cartridge, wound filters included on each sample stream analyzer assembly: one 50 microns and one 10 microns.
- C. Sensor – pH/Temperature (AE-961A, AE-962A, AE-963A, AE-964A, AE-965A, AE-966A)
  - 1. Manufacturer: Walchem – WEL (Model: WEL-PHF-72), or Engineer approved equal.
    - i. PH Sensor Flat
    - ii. PH Housing with PT1000 Tee
- D. Sensor – Chlorine Residual (AE-962B, AE-963B, AE-964B, AE-965B, AE-966B)
  - 1. Manufacturer: Walchem (Model: 191445), or Engineer approved equal.
    - i. Free Chlorine /Bromine sensor
    - ii. 200PPM
    - iii. No cable
- E. Controller (AIT-962, AIT-963, AIT-964, AIT-965, AIT-966)
  - 1. Manufacturer: Walchem – W900 (Model: WEL-PHF-72) as manufactured by Walchem, or Engineer approved equal.
    - i. 6 powered relays, Hardwired
    - ii. One Sensor Card
    - iii. One Dual isolated output card
    - iv. No Ethernet
    - v. Single DIS flow cell/cable, no sensor
    - vi. Three analog outputs (min)

## 2.6 TEMPERATURE INSTRUMENTS

- A. Room Temperature Transmitters (TT-112, TT-150, TT-180, TT-921, TT-923, TT-926, TT-930)
  - 1. Room temperature monitoring shall be via a wall mounted temperature transmitter with local readout. The temperature range monitored shall be 20° to 120°F. The unit shall be two-wire, looped power with a 4-20mA output.

2. Manufacturer: Devar; Kele; ProSense; or Engineer approved equal.

## 2.7 METERING PUMP CONTROL PANEL

- A. The KOH, NaOCl, NaHSO<sub>3</sub>, and NaF metering pumps shall be supplied with a pre-designed chemical feed interlock receptacle which shall include an HOA switch, emergency stop pushbutton, twist lock plug receptacle, integral lock-out timer, and local indicator light during Hand Operation.
- B. The HOA switch shall provide local control of the connection between the pump and the automatic control system. In Hand Mode the pump shall run if power is available at the twist lock plug. In Auto mode the pump shall run if control signals are present and calling for chemical. Off removes power from pump. A green LED light shall illuminate when in Hand mode.
- C. The emergency stop pushbutton shall shut down the corresponding metering pumps.
- D. The twist lock plug shall be a 115V female twist lock socket (NEMA L5-15P).
- E. The receptacle shall be supplied with an integral user adjustable one-shot cycle timer which energizes the twist lock outlet for a preset time (10 min max) when the pump HOA switch is in Hand mode. At the end of the pre-set time, the outlet shall de-energize and an alarm buzzer shall sound.
- F. Input Voltage: 125 VAC, 50/60 Hz
- G. Enclosure: PVC
- H. Manufacturer: CMI Pumps, or Engineer Approved Equal.

## 2.8 LABORATORY INSTRUMENTS

### A. Spectrophotometer

1. Bench scale spectrophotometer shall meet the following specifications:

- i. Beam Height: 10 mm
- ii. 2000 measured values (result, date, time, sample ID, user ID)
- iii. Dimensions (H x W x D): 151 mm x 350 mm x 255 mm
- iv. Display: 7" thin film transistor
- v. Display Resolution: 800 x 480 pixels
- vi. Display Type: Colored touch screen
- vii. Enclosure Rating: IP30
- viii. Light Source: Gas-filled Tungsten (visible)
- ix. Operating Temperature: 10°C to 40°C
- x. Operating Mode: Transmittance (%), Absorbance & Concentration, Scanning
- xi. Photometric Accuracy: 5 mAbs @ 0.0 - 0.5 Abs, 1% @ 0.50 - 2.0 Abs
- xii. Photometric Linearity: <0.5% - 2 Abs, ≤0.01% @ >2 Abs with neutral glass @ 546 nm

- xiii. Photometric Measuring Range:  $\pm 3.0$  Abs (wavelength range 340-900 nm)
- xiv. Power Supply: desk power supply, 120 VAC, 60 Hz
- xv. Warranty: 12 months

2. Consumables:

- i. Provide glassware and chemical consumables required to conduct the following tests:
  - a) Total Chlorine
  - b) Free Chlorine
  - c) Total Iron
  - d) Total Manganese
  - e) Fluoride
  - f) Turbidity
  - g) UV254
- 3. Manufacturer: Hach DR3900 or Engineer approved equal.

B. pH Meter and Electrode

- 1. Bench scale pH meter shall meet the following specifications:
  - i. Power: 4 AA batteries (included)
  - ii. pH Accuracy:  $\pm 0.002$  pH
  - iii. pH Measurement: 0-14 pH
  - iv. pH Resolution: Selectable between 0.001 and 0.1 pH
  - v. Warranty: 3 years
  - vi. Water Resistance: IP54
- 2. pH meter and electrode shall compatible and of the same manufacturer.
- 3. pH Meter Manufacturer: Hach (HQ2200) or Engineer approved equal.
- 4. Electrode Manufacturer: Hach (IntelliCal PCH301) or Engineer approved equal.

2.9 MISCELLANEOUS EQUIPMENT

A. Spare Parts

- 1. Spare parts shall be provided as a part of the start-up services during the initial start-up and phase-in period. These items shall include accessories such as fuses, electrodes, membranes, fluids, charts, ink, lights, etc. required to start-up and operate the system for a period of 60 days. These items shall be packaged in separate containers and shipped to the job site with the instruments and shall be tagged "INSTRUMENTATION START-UP EQUIPMENT."
- 2. Spare parts and accessories above and beyond those being provided for start-up services shall be provided under this Section. All spare parts shall be packaged and shipped at one time. Separate shipment of spare parts shall not be acceptable. The Engineer shall be notified of the shipment release in writing indicating that all items have been shipped.

Each item shall be checked by the Engineer as being received and that all components have been provided as specified.

3. A one year supply of consumables and replacement parts required for all instruments, analyzers, and devices being furnished for the system. A list of spare parts to be included in the one year supply of consumables and replacement parts shall be provided to the engineer during the shop drawing approval stage. Consumables and replacement parts shall be those over and above that which have been specifically identified in this section.
4. Refer to Section 13320 for additional spare part requirements.

### PART 3 – EXECUTION

REFER TO SECTION 13320 – PROCESS INSTRUMENTATION AND CONTROL

END OF SECTION 13325

## SECTION 13400

### SUPERVISORY CONTROL AND DATA ACQUISITION (SCADA) SYSTEM

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work associated with the supervisory control and data acquisition (SCADA) system including hardware are to be provided by the Integrator.
- B. The programming associated with the SCADA system including software and SCADA screen displays are to be provided by the Application Engineer.
- C. The work covered under this Section of the Specifications includes the following:
  - 1. This specification has been developed to establish minimum requirements for the SCADA software to be provided and programmed under this Section for the remote control, monitoring, and alarming of the Town of Sharon's Wells 2, 3, and 4 Water Treatment Plant (WTP)
  - 2. Integrator responsibilities: The Integrator shall be responsible to the Contractor for furnishing the SCADA software specified herein and providing the software to the Application Engineer for installation and programming. The Integrator shall be responsible for installing the programmed SCADA Servers on-site.
  - 3. Application Engineer responsibilities: The Application Engineer shall be responsible to the Owner and Engineer for installing the SCADA software specified herein on the SCADA Servers, programming the SCADA system controls and alarms, and developing SCADA Server and operator interface terminal (OIT) screens.
  - 4. The SCADA software to be furnished and installed for the WTP shall be integrated with and work in harmony with the Owner's existing SCADA systems associated with existing site facilities and off-site or remote facilities. A schematic diagram of existing and proposed SCADA systems is provided in the Contract Drawings.
  - 5. On-site coordination meeting with Owner; Engineer; Contractor; Integrator; Application Engineer; and equipment suppliers prior to start of work.

D. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements
2. Division 1 – General Requirements
3. Division 13 – Special Construction
4. Division 16 – Electrical

E. Work not included:

1. Integration with the Owner's existing drinking water system facilities; programming; SCADA screen development, ongoing operation of the Owner's existing drinking water facilities shall be covered under the Application Engineer's scope of work.
2. Electrical conduit relays, raceways, starters, etc., required for operation, control, and monitoring of equipment shall be furnished and installed under Division 16 of these specifications.
3. The power connections to all electrical devices furnished under this Section shall be performed under Division 16

### 1.3 SUBMITTALS

- A. Submit in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein.
- B. Product Data: Provide catalog sheets and technical data sheets to indicate all aspects of the software package and its capabilities.
- C. Submit licenses to the Owner for all software provided.
- D. Submit Manufacturer's programming manuals.
- E. Submit a legal copy of the SCADA software to be run on the SCADA Servers. All SCADA software and hardware or software keys shall be licensed to the Town of Sharon. The cost of the one-year Contract shall be included in the bid price for this construction Contract.
- F. Submit a two (2) year maintenance/upgrade Proposal to the Owner covering the purchase and installation of all upgrades to the SCADA software package during the maintenance period.

### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. Control, delivery, storage, and handling of equipment in accordance with Sections 01600 and 01610.

## 1.5 OPERATION AND MAINTENANCE DATA

- A. Furnish six (6) complete sets of Operations and Maintenance Instruction Manuals (O&M Manuals) prior to start-up. Furnish one (1) electronic Adobe PDF searchable version on thumb drive or CD-ROM.
- B. Submit under provisions of this Section.
- C. Operation Data: Description of operating procedures.
- D. Maintenance Data: Description of servicing procedures; list of major components, recommended remedial and preventive maintenance procedures; and recommended spare parts list for each product furnished under this section.
- E. Manuals shall be published by the Manufacturer and shall be of the most recent publication date.
- F. Refer to Specification Section 01730 – Operation and Maintenance Data for additional requirements.

## PART 2 –PRODUCTS

### 2.1 GENERAL

- A. The SCADA software provided under this section shall be the most recent version of the SCADA software.

### 2.2 SCADA SOFTWARE

- A. The SCADA software (SS) shall be designed for use in the Microsoft Server 2022 operating system for PCs.
- B. The SS shall be of the manufacturer's latest shipping version.
- C. The SS shall be complete with all functions available to the Owner. The Owner shall not be required to purchase any software to provide the full functionality of the software.
- D. The SS shall be a combination development/runtime version and shall have an unlimited point count.
- E. The SS shall support the following communications protocols at a minimum and shall be standard with the software:
  - 1. Allen Bradley Ethernet/IP.
  - 2. Modbus RTU
  - 3. GE Ethernet

4. DirectNET

5. Modbus TCP

F. The SS shall be object-based and event-driven.

G. The SS shall be able to be programmed while on-line and shall provide uninterrupted monitoring and control when switching between programming mode and runtime mode.

H. The SS shall be compatible with any OPC server or OPC client.

I. The SS shall be capable of data logging.

J. The SS shall be capable of trending real-time and historical data.

K. The SS shall be capable of creating alarms based on set points and/or logical expressions.

L. The SS shall maintain an event file and an alarm file that can be printed at a later date.

M. The SS shall be capable to interface with spreadsheet programs such as Microsoft Excel.

N. The SS shall be supplied with a library of graphic displays for the creation of SCADA screens.

O. Manufacturers:

1. The Town of Sharon has standardized their HMI software on the latest version of iFix by General Electric (**No substitutions shall be allowed**).

(1) GE iFix Developer Unlimited Tags

(1) GE iFix Runtime Unlimited Tags

## 2.3 REPORTING SOFTWARE

A. Software shall be furnished by the Integrator and programmed by the Application Engineer to gather data from the SCADA system and to generate monthly, weekly, and daily reports that will be used by the Owner and for MADEP Chemical Addition reporting.

## 2.4 ALARMING SOFTWARE

A. The software shall be designed for use in the Microsoft Server 2022 operating system for PCs.

- B. Alarming software shall be Win-911 v3.1 as noted above, and shall be provided, installed, and programmed to allow remote access to acknowledge alarms and to provide remote alarming capabilities.
- C. The following software functions shall be provided as a minimum:
  - 1. Notification of personnel by phone – on or off site.
  - 2. Voice/sound over remote speakers at facility.
  - 3. Pop-up on-screen windows.
  - 4. Voice alarm messages.
  - 5. Interfaces with the SCADA software package provided.
  - 6. Multiple adjustable trip settings for analog signals.
  - 7. Priority calling sequence.
  - 8. Archival of alarm history.
  - 9. Pager formatting.
  - 10. Customized day & time settings for phone/pager numbers – according to availability of personnel.
  - 11. Custom recording of voice messages.
  - 12. Acknowledgement from SCADA software package.

## 2.5 OPERATOR INTERFACE

- A. SCADA Servers as specified in Section 13100.

## PART 3 – EXECUTION

### 3.1 I/O SIGNAL COUNT

- A. Refer to the Contract Drawings.

### 3.2 ALARM SCHEDULE

- A. Refer to the pages that follow.

### 3.3 INTERLOCK SCHEDULE

A. Refer to the Contract Drawings and the pages that follow.

END OF SECTION 13400

Well Station 2  
Alarm Schedule

<b>Well Station 2 Alarms</b>		
<i>Alarm No.</i>	<i>Alarm Event</i>	<i>Action</i>
1	Well 2 Pump #1 VFD Fault (P-100A)	SCADA alarm
2	Well 2 Pump #1 High Temperature (P-100A)	SCADA alarm
3	Well 2 Pump #2 VFD Fault (P-100B)	SCADA alarm
4	Well 2 Pump #2 High Temperature (P-100B)	SCADA alarm
5	Well 2 Vacuum Priming Pump #1 Fault (P-101A)	SCADA alarm
6	Well 2 Vacuum Priming Pump #2 Fault (P-101B)	SCADA alarm
7	Well 2 Low Suction Pressure (PIT-107)	SCADA alarm, interlock 1
8	Well 2 Low-Low Suction Pressure (PIT-107)	SCADA alarm
9	Well 2 High Discharge Pressure (PIT-108A)	SCADA alarm
10	Well 2 High-High Discharge Pressure (PIT-108A)	SCADA alarm, interlock 4
11	Well 2 High Discharge Pressure (PIT-108B)	SCADA alarm
12	Well 2 High-High Discharge Pressure (PIT-108B)	SCADA alarm, interlock 5
13	Well 2 No Flow (Flow=0 gpm) (FIT-110)	SCADA alarm, interlock 6
14	Well 2 High Flow (>350 gpm) (FIT-110)	SCADA alarm
15	Well 2 Personnel Down (PB-111)	SCADA alarm
16	Well 2 Low Pump Room Temperature (TT-112)	SCADA alarm
17	Well 2 High Pump Room Temperature (TT-112)	SCADA alarm
18	Well 2 Flood (LSH-113)	SCADA alarm

226	Nitrate Removal Area High Temperature (TT-921)	SCADA alarm
227	Fe/Mn Removal Area Low Temperature (TT-923)	SCADA alarm
228	Fe/Mn Removal Area High Temperature (TT-923)	SCADA alarm
229	WTP Control Room Low Temperature (TT-926)	SCADA alarm
230	WTP Control Room High Temperature (TT-926)	SCADA alarm
231	Electrical Room Low Temperature (TT-930)	SCADA alarm
232	Electrical Room High Temperature (TT-930)	SCADA alarm
233	Low Raw Water pH (AIT-961)	SCADA alarm
234	High Raw Water pH (AIT-961)	SCADA alarm
235	Low Oxidized Water pH (AIT-962)	SCADA alarm
236	High Oxidized Water pH (AIT-962)	SCADA alarm
237	Low Oxidized Water Cl2 (AIT-962)	SCADA alarm
238	Low-Low Oxidized Water Cl2 (AIT-962)	SCADA alarm, interlock 48
239	High Oxidized Water Cl2 (AIT-962)	SCADA alarm
240	High-High Oxidized Water Cl2 (AIT-962)	SCADA alarm, interlock 49

Wells 2, 3, and 4 WTP  
Alarm Schedule

241	Low Fe/Mn Filtered Water pH (AIT-963)	SCADA alarm
242	High Fe/Mn Filtered Water pH (AIT-963)	SCADA alarm
243	Low Fe/Mn Filtered Water Cl2 (AIT-963)	SCADA alarm
244	High Fe/Mn Filtered Water Cl2 (AIT-963)	SCADA alarm
245	Low PFAS Influent pH (AIT-964)	SCADA alarm
246	Low-Low PFAS Influent pH (AIT-964)	SCADA alarm, interlock 50
247	High PFAS Influent pH (AIT-964)	SCADA alarm
248	High-High PFAS Influent pH (AIT-964)	SCADA alarm, interlock 51
249	High PFAS Influent Cl2 (AIT-964)	SCADA alarm
250	High-High PFAS Influent Cl2 (AIT-964)	SCADA alarm, interlock 52
251	Low Finished Water pH (AIT-965)	SCADA alarm
252	Low-Low Finished Water pH (AIT-965)	SCADA alarm, interlock 53
253	High Finished Water pH (AIT-965)	SCADA alarm
254	High-High Finished Water pH (AIT-965)	SCADA alarm, interlock 54
255	Low Finished Water Cl2 (AIT-965)	SCADA alarm
256	Low-Low Finished Water Cl2 (AIT-965)	SCADA alarm, interlock 55
257	High Finished Water Cl2 (AIT-965)	SCADA alarm
258	High-High Finished Water Cl2 (AIT-965)	SCADA alarm, interlock 56
259	Low 100-Foot Sample Tap pH (AIT-966)	SCADA alarm
260	Low-Low 100-Foot Sample Tap pH (AIT-966)	SCADA alarm
261	High 100-Foot Sample Tap pH (AIT-966)	SCADA alarm
262	High-High 100-Foot Sample Tap pH (AIT-966)	SCADA alarm
263	Low 100-Foot Sample Tap Cl2 (AIT-966)	SCADA alarm
264	Low-Low 100-Foot Sample Tap Cl2 (AIT-966)	SCADA alarm
265	High 100-Foot Sample Tap Cl2 (AIT-966)	SCADA alarm
266	High-High 100-Foot Sample Tap Cl2 (AIT-966)	SCADA alarm
267	Tight Tank High Level (LSH-971)	SCADA alarm
268	Tight Tank High-High Level (LSH-972)	SCADA alarm
269	Nitrate Removal Area Personnel Down (PB-981)	SCADA alarm
270	PFAS Removal Area Personnel Down (PB-982)	SCADA alarm
271	Fe/Mn Removal Area Personnel Down (PB-983)	SCADA alarm
272	WTP Control Room Personnel Down (PB-986)	SCADA alarm
273	Pipe Gallery West Personnel Down (PB-991)	SCADA alarm
274	Pipe Gallery East Personnel Down (PB-992)	SCADA alarm
275	WTP Control Panel Emergency Stop (PB-993)	SCADA alarm, interlock 57
276	Fe/Mn Removal Area Emergency Stop (PB-994)	SCADA alarm, interlock 58
277	Pipe Gallery Flood (LSH-996)	SCADA alarm
278	Nitrate Removal Area Dehumidifier #1 High Level (DHU-1)	SCADA alarm
279	Nitrate Removal Area Dehumidifier #2 High Level (DHU-2)	SCADA alarm
280	Fire (Fire Alarm Control Panel)	SCADA alarm
281	Supervisory (Fire Alarm Control Panel)	SCADA alarm
282	WTP Intrusion (Security Access Control Panel)	SCADA alarm
283	Chemical Alarm (Chemical Alarm System Control Panel)	SCADA alarm

## SECTION 13420

### CONTROL SYSTEM EQUIPMENT PANELS AND RACKS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

- 1. Provide all wiring, labor, tools, materials, and equipment to modify existing control panels, furnish new control panels, install, and test control panels, networking equipment, and enclosures in accordance with this Section and applicable reference standards listed in Section 13320 Instrumentation and Controls.

- B. Related Sections include the following:

- 1. Division 0 – Bidding and Contract Requirements
- 2. Division 1 – General Requirements
- 3. Section 13200- Programmable Logic Controllers
- 4. Section 13320- Instrumentation and Controls

- C. Work included:

- 1. The Contractor shall be responsible for the following:
  - i. Installation of Control Panels.
  - ii. Installation of Intrinsic Safety Barrier Panels (ISBP).
  - iii. Termination, labeling, and testing of all cable and signal wiring to associated panels.

##### 1.3 SUBMITTALS

- A. Provide in accordance with Division 1 General Requirements.

- B. Product Data: as listed below unless letter regarding shop drawing level control panel drawings are submitted per Paragraph 1. 3.C.1. below.

- 1. Bill of materials (BOM) for each control panel, including panel tag name or number and component description, quantity, manufacturer name and model number for each component used in fabrication. BOM: keyed to easily correlate components

shown in bill of materials with components shown on control panel equipment layout Drawings.

2. Manufacturer's literature for each component identified on BOM. Clearly designate part number with highlights or arrows.
3. Equipment layout drawings for each control panel
4. Panel communication diagrams for each control panel
5. Power wiring diagrams for each control panel
6. Programmable logic controllers (PLC) input/output (I/O) wiring diagrams, on a module-by-module basis

C. Shop Drawings

1. A letter with copy of fabrication drawings confirming control panel fabricator will fabricate control panels as specified on shop drawing level control panel drawings may be provided in lieu of Shop Drawings.

D. Procurement of materials and manufacture of the control panels shall not begin until related submittals have been reviewed by the Engineer.

E. Closeout and Maintenance Material Submittals per Division 1 General Requirements.

1. As-Built Drawings

- i. After fabrication of control panels and factory acceptance testing is complete, panel shop shall provide drawings of control panels, representing as-built conditions. Submit panel drawings in AutoCAD DWG and Adobe PDF file formats, on USB drive media or cloud-based file sharing service.
- ii. Submit with panels at delivery.
- iii. Legible red-line markups of shop drawing level drawings from panel shop may be provided if used in lieu of Shop Drawings.

F. Operation and Maintenance (O&M) Information

1. Refer to Division 1 General Requirements for O&M material requirements. In addition to the requirements in Division 1, the control panel section of the O&M manuals shall include:
  - i. Record Drawings of the control panels, updated to reflect the panels after checkout and startup.
  - ii. Installation and operation manuals for all major control panel components, including the network switches, PLCs, I/O modules, communication equipment.

#### 1.4 QUALITY ASSURANCE

- A. Provide in accordance with Division 1 General Requirements.
- B. Control panel fabricator, Panel Shop, shall hold a valid UL-508A certification for their panel fabrication facility, and shall have executed a minimum of 3 Projects of similar scope in the municipal water and wastewater markets in the past 5 years.
- C. Surge protection shall be provided by a recognized manufacturer with a minimum of 5 years' experience in the production of this equipment.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Provide in accordance with Division 1 General Requirements.
- B. Acceptance at Site
  - 1. Check equipment, instruments, and materials for damage or defects within 7 days of delivery. Repair or replace to satisfaction of Engineer.

#### 1.6 COORDINATION

- A. Provide in accordance with Division 1 General Requirements.
- B. Coordinate equipment, instrument, and material delivery to coincide with the Project schedule. If the delivery schedule of any equipment, instrument, or material shall affect the overall Project schedule, notify the Owner and Engineer in writing immediately. Include in the written notification, documentation from the equipment Supplier indicating the revised delivery schedule and reason for the change.
- C. When applicable, coordinate delivery equipment, instruments, or materials to be delivered directly to another trade or vendor for installation in a system or control panel provided under another Specification section.
- D. Exercise care while loading, unloading and transporting equipment, instruments and materials to avoid damage. Check all equipment, instruments, and materials for damage or defects within 7 days of delivery to the Project Site.
- E. Equipment, instruments, and materials required to be stored on Site prior to installation shall be stored in such a manner to avoid damage or exposure to water, dust, or construction debris.
- F. Repair or replace, at no additional cost to the Owner, all equipment, instruments and materials that are defective or damaged during installation.

### PART 2 – PRODUCTS

#### 2.1 CONTROL PANEL COMPONENTS

A. The following table contains control panel components and recommended manufacturers for each component.

<b>Control Panel Components</b>	<b>Manufacturer (or approved equivalent)</b>	<b>Comments</b>
Enclosures	Saginaw Hoffman Hammond	Shall be suitable for use in the environments that they will be located (NEMA, NFPA, etc.)
Enclosure Lighting	Saginaw Hoffman Hammond	LED strip light to provide interior lighting for enclosures
Programmable Logic Controllers (PLCs)		Refer to section 13200, Programmable Logic Controllers
Operator Interface Terminals (OITs)		Refer to section 13200, Programmable Logic Controllers
Wireway	Panduit Hoffman	
DIN Rail	Allen Bradley Phoenix Contact	
Terminal Blocks	Allen Bradley Phoenix Contact Entrelec	Utilize 2-tier terminal blocks wherever possible to conserve panel space.
Terminal Block Fuse Holders	Allen Bradley Phoenix Contact Entrelec	Specify fuse holders with blown fuse indicators.
Circuit Breakers	Square D Allen Bradley	
120VAC Surge Suppressors	Allen Bradley Phoenix Contact Square D	
Analog Surge Suppressors	Allen Bradley Phoenix Contact Citel	
Media Converters	N-Tron B&B Electronics L-Com	Furnish with DIN rail mount converters as required on the network architecture

<b>Control Panel Components</b>	<b>Manufacturer (or approved equivalent)</b>	<b>Comments</b>
Fuses	Bussman Mersen	All glass fuses in control panels shall be fast acting style. Motor circuit protection fuses shall be time delay style.
Control Relays	Allen Bradley Square D Omron	Include all required bases and hardware.
Power Supplies	Sola Phoenix Contact Allen Bradley	Furnish with power supplies sized as required for equipment contained within the enclosures and to supply field equipment connected to the enclosure.
Intrinsic Safety Barriers	Pepperl & Fuchs MTL Phoenix Contact	Discrete barriers shall be 2-channel barriers. Analog barriers shall be 2-wire barriers.
Ethernet Switches (Unmanaged)	N-Tron Allen Bradley B&B Electronics	Switches shall be furnished with direct-wired low voltage power source within the enclosure.
Ethernet Switches (Managed)	Cisco Allen Bradley N-TRON	All switches throughout the facility shall be furnished from the same manufacturer.
Emergency Power System	Sola Phoenix Contact Allen Bradley	Include uninterruptible power supply (UPS) in each control panel sized to furnish with at least 10 minutes of emergency power.
Panel Heaters	Hammond Hoffman Pfannenber	Furnish with panel heaters for outside control panels where temperature is a concern for electronic components.
Receptacles	Pass & Seymour Hubbel Leviton	Furnish with receptacle for UPS and convenience receptacle in each PLC control panel.
Pilot/Status Lights (Push to test)	Allen Bradley General Electric Square D	Color code as follows: Red-Fault, Green-Run
HOA, On/Off, L/R switches and push buttons	Allen Bradley General Electric Square D	Furnish switches and push buttons with matching nameplate

PART 3 – EXECUTION

3.1 CONTROL PANEL FABRICATION

B. General

1. Control panels shall include PLC, required I/O modules with chassis, if applicable, power supply, cables, and all appurtenances. Enclosures shall include switches, lights, annunciators and all appurtenances. Furnish panels and materials from one Supplier.
2. Provide electronic equipment utilizing printed circuitry and epoxy or equal coating to prevent contamination by dust, moisture, and fungus. Solid-state components: rated to provide reliable performance over ambient atmosphere fluctuations between 0 – 140 degrees F and 0 – 95 percent relative humidity, non-condensing. Field mounted equipment and system components: designed for installation in dusty, humid, and slightly corrosive service conditions.
3. Equipment installed in a hazardous area shall meet Class, Group, and Division to comply with the NFPA 70.
4. Provide heavy duty equipment, cabinets, and devices designed for continuous industrial service using current production products.
5. Fabrication requirements of control panels, enclosures, consoles, and cabinets.
  - i. Size enclosures to fit all required equipment, accommodate all field wires and provide adequate working space.
  - ii. Size control panel enclosures to provide at least 20 percent spare space for future expansion.
  - iii. Provide PLC hardware to accommodate minimum 20 percent spare of each I/O type used in panel, wired to terminals and interposing relays during fabrication process.
  - iv. Provide panel door with flush type, 3-point locking latches with keys.
  - v. Provide drawing pocket to hold as-built and service documentation.
  - vi. Provide control panel assemblies in compliance with UL 508A Standards.

C. Control Panels

1. The name, Tag Identification, and NEMA enclosure rating for the control panels to be furnished under this section or under Division 11 shall be as follows:

<b>Name</b>	<b>Tag Id</b>	<b>Enclosure</b>
Well Station 2 Control Panel	(Well 2 CP)	Wall Mounted, NEMA-12
Well Station 3 Control Panel	(Well 3 CP)	Wall Mounted, NEMA-12
Well Station 4 Control Panel	(Well 4 CP)	Wall Mounted, NEMA-12
WTP Main Control Panel	(MCP)	Floor Mounted, NEMA-1
Well Station 4 Fiber-Patch Panel	(FPP)	Wall Mounted, NEMA-1
WTP Main Fiber-Patch Panel	(MFPP)	Wall Mounted, NEMA-1

Potassium Hydroxide Bulk Chemical Fill Panel (Interior and Exterior)	(KOH BCFP)	Wall Mounted, NEMA-4X
Sodium Hypochlorite Bulk Chemical Fill Panel (Interior and Exterior)	(NaOCl BCFP)	Wall Mounted, NEMA-4X
Sodium Bisulfite Bulk Chemical Fill Panel (Interior and Exterior)	(NaHSO3 BCFP)	Wall Mounted, NEMA-4X
Sludge Pump Field Control Panel	SP-FCP	Wall Mounted, NEMA-4X

2. Refer to the Contract Drawings for the location of each control panel/cabinet and panel layouts for specified panels.

3. Panel/Cabinet Components

I. The Well Station Control Panels shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:

- i. PLC and subsystem components as specified in Section 13200.
- ii. OIT as specified in Section 13200.
- iii. Managed Ethernet Switch as specified herein (Well Station 4 Control Panel only).
- iv. UPS as specified herein and shown on the Contract Drawings.
- v. Courtesy equipment as specified herein.
- vi. Electrical receptacles as specified in Division 16.
- vii. Panel Surge Suppression and Power Supplies as specified herein.
- viii. Indicator lights as shown on the Contract Drawings.
- ix. Emergency alarm pushbutton as specified herein and as shown on the Contract Drawings.
- x. Network and communication devices specified herein and shown on the Contract Drawings.
- xi. Programming port as specified herein.
- xii. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.

II. The Main Control Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:

- i. PLC and subsystem components as specified in Section 13200.
- ii. OIT as specified in Section 13200.
- iii. Managed Ethernet Switch as specified herein.
- iv. UPS as specified herein and shown on the Contract Drawings.
- v. Courtesy equipment as specified herein.

- vi. Electrical receptacles as specified in Division 16.
  - vii. Panel Surge Suppression and Power Supplies as specified herein.
  - viii. Indicator lights as shown on the Contract Drawings.
  - ix. Emergency alarm pushbutton as specified herein and as shown on the Contract Drawings.
  - x. Network and communication devices specified herein and shown on the Contract Drawings.
  - xi. Programming port as specified herein.
  - xii. Firewall as furnished by the Application Engineer.
  - xiii. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.
- III. The Well Station 4 Fiber-Patch Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. 6 port fiber connection
  - ii. Multimode 62.6 fiber compatibility
  - iii. Integrated 12 position slicing chip and adapter panel
  - iv. Cable entry tie down points
  - v. DIN-rail mounting system
- IV. The WTP Main Fiber-Patch Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. 6 port fiber connection
  - ii. Multimode 62.6 fiber compatibility
  - iii. Integrated 12 position slicing chip and adapter panel
  - iv. Cable entry tie down points
  - v. DIN-rail mounting system
- V. The Potassium Hydroxide Bulk Chemical Fill Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. Clear window vision panel.
  - ii. KOH bulk storage tank level digital display as specified herein.
  - iii. Indicator lights as shown on the Contract Drawings.
  - iv. Emergency alarm pushbutton as specified herein and as shown on the Contract Drawings.
  - v. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.
- VI. The Sodium Hypochlorite Bulk Chemical Fill Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. Clear window vision panel.
  - ii. NaOCl bulk storage tank level digital display as specified herein.
  - iii. Indicator lights as shown on the Contract Drawings.
  - iv. Emergency alarm pushbutton as specified herein and as shown on the

Contract Drawings.

- v. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.
- VII. The Sodium Bisulfite Bulk Chemical Fill Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. Clear window vision panel.
  - ii. NaHSO<sub>3</sub> bulk storage tank level digital display as specified herein.
  - iii. Indicator lights as shown on the Contract Drawings.
  - iv. Emergency alarm pushbutton as specified herein and as shown on the Contract Drawings.
  - v. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.
- VIII. The Sludge Pump Field Control Panel shall include, make provisions for, and provide sufficient space for the following, as indicated on the Contract Drawings and specified herein:
- i. Clear window vision panel.
  - ii. Three (3) Backwash Waste Tank level digital displays as specified herein.
  - iii. Selector switches as shown on the Contract Drawings.
  - iv. Indicator lights as shown on the Contract Drawings.
  - v. All other ancillary equipment required for a fully operational system as specified herein and shown on the Contract Drawings.
- IX. Digital displays shall be LED type 14 mm high numbers with display in engineering units coordinated with input signals. Displays shall be NEMA-4X rated. Displays shall be adjustable from one to three decimal points, as manufactured by Newport Electronics, Honeywell, General Electric, or approved equal.

#### D. Wiring

1. Interconnecting wiring: stranded and have 600-volt insulation.
2. Power distribution wiring on line side of fuses.
3. Power and low voltage direct current (DC) wiring systems: routed in separate wireways. Crossing of power distribution wiring and control wiring: at right angles. Different system wires routed parallel to each other: separated by at least six (6) inches. Different wiring systems shall terminate on separate terminal blocks. Wiring troughs may not be filled to more than 60 percent visible fill.
4. All wiring shall terminate onto single-or-double tier terminal blocks, where each terminal is sequentially numbered with a unique identifier. Direct interlock wiring between equipment is not allowed. Control panel: fabricated with minimum 20 percent spare terminals. Terminal blocks: arranged in vertical rows and separated into groups;

power, alternating current (AC) control, DC signal. Terminal blocks: compression screw type. Spring-clamp style terminals will not be accepted.

- i. Discrete inputs (DI) and discrete outputs (DO) shall have 2 terminals per point with adjacent terminal assignments. Active and spare points: wired to terminal blocks.
- ii. Analog inputs (AI) and analog outputs (AO) shall have a minimum of three (3) terminals per shielded pair. Provide three (3) terminals for direct connection of powered, 4-wire loops. Provide four (4) terminals for direct connection of loop powered, 2-wire loops. Provide five (5) terminals for connection of analog loops incorporating a local indicator or recorder. One terminal is for shielded ground connections for cable pairs. Ground the shielded signal cable at the PLC cabinet. Wire active and spare points to terminal blocks.
- iii. Wire and tube markers in accordance with Division 16 requirements.
- iv. Only one (1) side of a terminal block row shall be used for internal wiring. Field wiring side of terminal shall not be within six (6) inches of side panel or adjacent terminal, or within eight (8) inches of bottom of panel.
- v. Locate terminals for field wiring to reduce amount of routing through wireway to carry wiring to termination point.

5. Provide wiring, internal to panel and field wiring, with service loop to allow for future adjustment of termination point. Service loop: no more than 4-5 inches, stored in associated wireway.

6. Identify live circuit wiring, independent of the panel's normal circuit breaker protection.

7. All wiring shall be clearly tagged and color-coded in accordance with NEC. All tag numbers and color-coding shall correspond to panel wiring diagrams prepared by Engineer. All power wiring, control wiring, grounding, and DC wiring shall utilize different color insulation for each wiring system used. Utilize the following color-coding scheme.

- i. Incoming 120 VAC Hot – Black
- ii. 120 VAC Hot Wiring (control circuit wires downstream of panel circuit breaker) – Red
- iii. 120 VAC Neutral – White
- iv. Ground – Green with yellow stripe
- v. DC Wiring – Blue
- vi. DC Common – White with blue stripe
- vii. Intrinsically Safe Wiring - Light Blue
- viii. Foreign Voltage – Yellow

#### E. Control Panel Loss of Power

1. Each control panel containing a PLC shall have an input configured to alarm the operators upon loss of main control panel power. Display alarm on SCADA nodes to alert operators that attention is required.

#### F. Control Panel Overcurrent Protection

1. Overcurrent protection devices: properly sized to protect associated devices and loads.
2. Circuit breakers: sized to protect associated equipment and provide necessary power to operate.
3. Fuses
  - i. Glass fuses not associated with motor circuit protection or inductive loads: specified as fast-acting style. Fuses associated with motor circuit protection or inductive loads: specified as time delay style.

#### G. Lightning/Surge Suppression

1. Provide to protect control panel and associated equipment from surges on incoming power circuits, or those induced by lightning strikes and propagated along signal or power lines connected to control panels. Surge protection: sized properly for intended purpose.
2. 120 VAC Surge Suppression
  - i. Provide incoming 120 VAC power source for control panel with surge suppression located in the control panel. Surge protection device rated at a minimum of 10 kilo amperes (kA).
  - ii. Provide surge suppressors with auxiliary contact, connected to PLC to indicate surge suppressor failure. If there are multiple circuits within the same control panel, provide each incoming 120 VAC power sources with surge suppression.
3. Analog Signal Surge Suppression
  - i. Supply analog signals connected to equipment or instrumentation located outside the building where the control panel is installed with DIN rail mounted surge suppression in control panel. Provide surge protection at both ends of signal cable and mount surge protection as close to equipment, instrument, or termination point as possible. Provide minimum of 10 kA surge current suppression.
4. Ethernet Surge Suppression
  - i. Provide Ethernet cabling connected to control panel that leaves the building that houses the control panel with surge suppression in the control panel. Provide surge protection at both ends of telephone or Ethernet cabling and mount surge protection as close to termination point as possible.

#### H. Uninterruptible Power Supplies

1. Control panel mounted UPS shall be 24VDC and din-rail mountable. UPS shall have remote monitoring features with relay contact outputs, connected to the PLC to indicate UPS fault and UPS low battery conditions, at a minimum.
2. Size UPS to provide minimum of 10 minutes of power in event of main control power loss.

I. DC Power Supply

1. Din Rail mounted power supply shall be housed in a rugged metal case with large, accessible, multiple connection screw terminals.
2. Power supply shall be enclosed and finger safe. Open power supplies shall not be acceptable.
3. Power supply shall feature Auto selecting 115/230 VAC, 50/60 Hz single phase input, adjustable voltage, power factor correction, short circuit, overvoltage and over-temperature protection, 90% or greater efficiency, power supply shall be UL listed.

J. Managed Ethernet Switches

1. Ethernet switches sized to accept number of connections shown on Drawings.
2. Managed (Layer 3 and 2) ethernet switches shall have a minimum of eight (8) fast ethernet ports and two (2) Gigabit Ethernet Combo Ports. Provide SFP modules for each combo port used.
3. Provide ethernet switches with minimum of 20 percent spare RJ-45 ports available for future expansion.
4. Ethernet switch acceptable level of quality equal to: Cisco IE3300 and IE1000 series as shown on the drawings.

K. Unmanaged Ethernet Switches

1. Ethernet switches sized to accept number of connections shown on Drawings.
2. Provide ethernet switches with minimum of 20 percent spare RJ-45 ports available for future expansion.
3. Ethernet switch acceptable level of quality equal to: Allen Bradley Stratix 2000.

L. Interposing / Control Relays

1. DIN rail mounted Miniature plug-in style relays sealed, 10A resistive rating at 120VAC, double throw Form C contact outputs, UL Listed. Life expectancy shall be 50 million operations, minimum.

M. Courtesy Equipment

1. Provide in each panel:
  - i. LED light fixture powered from 120VAC and activated by switch or motion sensor when the enclosure door opens. Number of fixtures as required for sufficient lighting to perform maintenance and troubleshooting.
  - ii. Print storage pockets shall be provided on the inside of each panel and shall be of sufficient size to hold prints required to service the equipment.

#### N. Intrinsic Safety Barrier Panels

1. Mount intrinsic safety barriers required for interfacing with equipment and instruments located in a classified area, in a panel separate from control panels.
2. Panels housing intrinsic safety barriers: laid out to facilitate separation of hazardous and non-hazardous wiring. Wireway containing hazardous area wiring: clearly indicated.

#### O. Equipment Mounting/Arrangement

1. Mount components in a manner that permits servicing, adjustment, testing and removal without disconnecting, moving or removing any other component. Mount components on inside of panels on removable plates, not directly to enclosure. Mounting: rigid and stable unless shock mounting is required by manufacturer to protect from vibration. Identify components with plastic or metal engraved tags attached with drive pins adjacent to each component, identifying the component in accordance with the Drawings and Specifications.
2. Install exterior panel mounted equipment with suitable gaskets, faceplates, and other measures required to maintain NEMA rating of panel.
3. Provide minimum of 1½ inches between panel wireway and terminal blocks for easy access to wiring.
4. Maintain manufacturer recommended spacing around panel-mounted equipment.
5. ISA-RP60.3 Recommended Practice: used as a guide in layout and arrangement of panels and panel mounted components.

#### P. Nameplates

1. Furnish panels and panel devices with nameplates identifying panel and individual devices with the following.
  - i. Device tag number: as shown on Drawings.
  - ii. Functional description
  - iii. Functional control description
2. Furnish 3/32-inch thick, black and white, Lamacoid nameplates with engraved inscriptions, unless escutcheon plates are specified or noted on Drawings. Letters: black against a white background. Edges of nameplates: beveled and smooth. Affix to panels using #4-40 threaded stainless-steel button head hex screws.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 13420

THIS PAGE IS INTENTIONALLY BLANK

## SECTION 13465

### SEQUENCE OF OPERATIONS

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. This Specification has been developed to describe a basic functional description of each process by means of a loop description. These function descriptions shall act as a reference for the Contractor, Integrator, and Application Engineer.
- B. The loop descriptions are intended to provide for system operation. The loops specified under this section describe the general system operating requirements and may not include all required control interlocks or safety shutdowns required based on actual process equipment supplied. The control system supplier shall be responsible for coordinating the actual requirements with the individual equipment manufacturers and providing all control and safety equipment required. Coordinate final loop descriptions with Application Engineer, Engineer, and equipment manufacturers.
- C. Related Sections include the following:
  - 1. Division 0 – Bidding and Contract Requirements
  - 2. Division 1 – General Requirements
  - 3. Division 13 – Special Construction
  - 4. Division 16 – Electrical

##### 1.3 SUBMITTALS

- A. Submit the following in accordance with the Conditions of Contract and Division 1 Specification Sections and as specified herein.
- B. Submit flow diagrams for the programming of the Programmable Logic Controllers (PLCs).

##### 1.4 OPERATION AND MAINTENANCE MANUALS

- A. Submit materials for inclusion in Operating and Maintenance Manuals specified in Specification Section 01730.

## PART 2 – PRODUCTS (NOT USED)

## PART 3 – EXECUTION

### 3.1 SEQUENCE OF OPERATIONS

A. A summary of alarm conditions is provided in Specification Section 13400 and shown on the Contract Drawings. A summary of equipment interlocks is provided on the Contract Drawings.

B. Wells 2, 3, and 4 Pumps

Groundwater from Well 2 is pumped via one (1) of two (2) multistage inline vertical pumps (P-100A & P-100B), and groundwater from Wells 3 and 4 is pumped via vertical turbine well pumps (Well 3: P-141; Well 4: P-171) into the water treatment process. The pump motor speeds shall be controlled by variable frequency drives (VFDs) (Well 2: P-100A VFD & P-100B VFD; Well 3: P-141 VFD; Well 4: P-171 VFD). Each VFD is provided with a Hand-Off-Auto (H-O-A) selector switch. In the HAND (manual) mode, the operator can locally adjust the motor speed by the corresponding VFD keypad using local buttons to increase/decrease motor speed (0 to 100%). Motor speed (%) and hertz (0 to 60 Hz) are indicated locally on the VFD display; and remotely on the well stations SCADA panel operator interface terminal (OIT); Wells 2, 3, and 4 Water Treatment Plant (WTP) Main Control Panel (MCP) OIT; and in the SCADA system. In the AUTO (remote) mode, the motor speed of the well pump shall be controlled automatically by the SCADA system. An emergency stop push button located on the Well Station SCADA Control Panels (PB-117, PB-152, PB-183) shall de-energize the respective well pump (Well 2: P-100A & P-100B; Well 3: P-141; Well 4: P-171) and an “Emergency Stop” alarm shall be reported in the SCADA system.

In order for the well pumps to run in AUTO mode, the corresponding VFD H-O-A selector switch shall be in the AUTO position. The wells shall operate based on the WTP finished water wet well (FWWW) level via LIT-711 and LSH-712A. The well pumps (Well 2: P-100A & P-100B; Well 3: P-141; Well 4: P-171) and recycle pumps (P-800A, P-800B) shall start at an operator selectable “Well Pump Start” FWWW level set point and shut off at an operator selectable “Well Pump Stop” FWWW level set point. The well pumps shall start and stop sequentially, as determined during WTP startup and testing.

Each well pump shall run at an operator selectable speed or flow rate, as selected on the respective well station SCADA panel OIT, WTP MCP OIT, or in the SCADA system. Wells 2, 3, and 4 shall start sequentially (sequence shall be operator selectable). Each well shall reach the operator selectable speed set point before the next well starts. The speed of each well pump VFD shall be set at the well station OIT, the WTP MCP OIT, or in the SCADA system and shall not vary based on conditions at the WTP. The operator shall be able to toggle each well between “HAND”, “OFF”, and “AUTO” modes in the SCADA system. Well pumps (P-100A, P-100B, P-141, P-171) VFD Fault and High Temperature alarms shall be reported in the SCADA system. Well pumps

shall ramp up or ramp down for 30 seconds when called to start or stop, respectively. Normal shutdown of Wells 2, 3, and 4 shall occur sequentially (sequence shall be operator selectable).

### C. Well 2

Pressure transmitters shall be provided on the Well 2 pump suction piping (PIT-107) and pump discharge piping (PIT-108A & PIT-108B). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for low-low and low suction pressure (via PIT-107), and high-high and high discharge pressure (via PIT-108A & PIT-108B). The alarm set points shall be operator selectable. The Well 2 pumps (P-100A & P-100B) shall be de-energized by the SCADA system for low-low suction pressure (via PIT-107) or high-high discharge pressure (via PIT-108A & PIT-108B).

A flow meter shall be provided on the Well 2 pump discharge piping (FIT-110). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall be operator selectable. If the Well 2 pumps (P-100A & P-100B) are energized and no flow is detected (via FIT-110) after a 90 second start-up delay (operator selectable), the SCADA system shall de-energize the Well 2 pumps.

Daily (gallons) and total (million gallons) well production volumes shall be totalized and stored in the SCADA system for each well (via FIT-148, FIT-178). A running annual average totalizing the raw water production (million gallons) for a duration of four (4) consecutive billing quarters shall be stored in the SCADA system for each well. An alarm shall be reported in the SCADA system if the daily raw water production exceeds the maximum daily withdrawal rate (0.47 million gallons per day [MGD]) (operator selectable) is exceeded in a single calendar day (12:00 AM to 11:59 PM). The total daily raw water production shall be calculated as the sum of the daily production for each well and shall be reported in gallons. The daily well and total daily raw water totalizers shall reset at 12:00 AM each day.

A Vacuum Priming System at Well Station 2 is connected to the Well Station 2 MCP through a Vacuum Priming System Field Control Panel (VPS-FCP). The vacuum priming system is a pre-packaged system that includes rotary vane vacuum priming pumps (P-101A and P-101B), receiver tank (VT-102), vacuum pressure indicating transmitter (PIT-116), receiver tank level switch (LSH-114), proof of prime switches (LSL-115A & LSL-115B), and field control panel (VPS-FCP). The vacuum priming system shall operate locally based on the vacuum readings as measured by PIT-116 with local, hand, and automatic controls (HS-101C & HS-101D) and feedback as shown on the Contract Drawings. The call for a priming cycle shall be automatic based on vacuum readings as measured by PIT-116, and status shall be reported at the VPS-FCP, SCADA panel OITs, and WTP SCADA server. The proof of prime switches (LSL-115A & LSL-115B) shall be electrically interlocked with the well pump VFDs and shall serve to ensure that the Well 2 pump suction line is completely full of water during pump operation. A low suction piping water level via the proof of prime switch

(LSL-115A & LSL-115B) shall de-energize the respective Well Station 2 pumps (P-100A & P-100B, respectively) and a pump fault alarm shall be reported in the SCADA system.

#### D. Wells 3 and 4

Level transmitters shall be provided in Well 3 (LE-146) and Well 4 (LE-176). Level transmitters measure and transmit well level both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for low-low and low well levels. The alarm set points shall be operator selectable. The well pumps (Well 3: P-141; Well 4: P-171) shall be de-energized by the SCADA system for low-low well level (via LE-146 & LE-176, respectively).

Pressure transmitters shall be provided on the Well 3 pump discharge piping (PIT-147) and Well 4 pump discharge piping (PIT-177). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high-high and high discharge pressure. The alarm set points shall be operator selectable. The well pumps (Well 3: P-141; Well 4: P-171) shall be de-energized by the SCADA system for high-high discharge pressure (via PIT-147 & PIT-177, respectively).

Flow meters shall be provided on the Well 2 pump discharge piping (FIT-110), Well 3 pump discharge piping (FIT-148), and Well 4 pump discharge piping (FIT-178). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall be operator selectable. If the well pumps (Well 3: P-141; Well 4: P-171) are energized and no flow is detected (via FIT-148 or FIT-178, respectively) after a 90 second start-up delay (operator selectable), the SCADA system shall de-energize the corresponding well pump.

Daily (gallons) and total (million gallons) well production volumes shall be totalized and stored in the SCADA system for each well (via FIT-148, FIT-178). A running annual average totalizing the raw water production (million gallons) for a duration of four (4) consecutive billing quarters shall be stored in the SCADA system for each well. An alarm shall be reported in the SCADA system if the daily raw water production exceeds the maximum daily withdrawal rate (Well 3: 0.38 MGD; Well 4: 1.00 MGD) (operator selectable) is exceeded in a single calendar day (12:00 AM to 11:59 PM). The total daily raw water production shall be calculated as the sum of the daily production for each well and shall be reported in gallons. The daily well and total daily raw water totalizers shall reset at 12:00 AM each day.

#### E. WTP Raw + Recycle Water Pressure

A pressure transmitter shall be provided on the WTP Well 2 & 3 raw and recycle piping (PIT-211). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and low influent pressure. The alarm set points shall be operator selectable.

## F. Iron and Manganese (Fe/Mn) Filter Flow

The Fe/Mn filtration system shall be controlled in two modes: Manual and Automatic.

### Filter Flow – Manual Mode

The Manual mode of operation shall provide operator initiation or intervention of equipment operations. Each individual equipment device may be started locally and/or remotely without SCADA program interlocks. Interlocks shall still operate to prevent damage or injury. Manual equipment and valve control shall be provided by selector switches located at the equipment or integrated controls. H-O-A operation of each individual piece of equipment shall be provided at the WTP MCP OIT or MCC located in the Electrical Room. Manual mode operation is not typical.

### Filter Flow – Automatic Mode

In the Automatic mode, the Filter Flow loop shall start/stop based on the Well 2 and 3 pumps start/stop. Under normal operations, all three filters shall be online.

In the Automatic mode, all equipment selector switches and integral controls must be in the “AUTO” or “REMOTE” positions/modes for SCADA control. In the Automatic mode, the operator shall select the following via the SCADA system: Filter #1 (PF-200A) on-line (ON/OFF), Filter #2 (PF-200A) on-line (ON/OFF), Filter #3 (PF-200A) on-line (ON/OFF), and individual filter flow rates (via percentage of raw water). There are two SCADA modes: SCADA-Headloss and SCADA-Filter Run Time. The operator can select the automatic mode in the SCADA system or at the WTP MCP OIT. The operator shall be able to toggle each filter between “ACTIVE”/ “ON” and “INACTIVE”/ “OFF” modes. If a filter is put into the “INACTIVE” mode, all filter valves for that filter shall close and the filter shall be locked out from the automatic mode of operation.

In the SCADA-Headloss and SCADA-Filter Run Time modes, the total raw and recycle water flow to the Fe/Mn filters shall be delivered from Wells 2 and 3 based on operator-selected well pump variable speed set points or flow rate setpoints. The total Wells 2 & 3 raw and recycle flow (FIT-212) shall be evenly divided between the on-line filters per the individual filter flow rate set point. The filter influent flow meters (FIT-213A, FIT-213B, FIT-213C) measure individual filter flow, and the flow rate for each is displayed remotely at a flow indicator, at the WTP MCP OIT, and in the SCADA system. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) shall be modulated (%OPEN) by a signal from the SCADA system to meet the individual filter flow set point with feedback from the respective filter flow meter (FIT-213A, FIT-213B, FIT-213C). Filter influent control valve (BFV-236A, BFV-236B, BFV-236C) filter flow start position (%OPEN) shall be operator selectable and determined during startup. The valves shall modulate as necessary to achieve the desired flow. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) %OPEN position shall be reported locally, at the WTP MCP OIT, and in the SCADA system.

In the SCADA-Headloss and SCADA-Filter Run Time modes, the filter effluent control valve (BFV-238A, BFV-238B, BFV-238C) shall remain open. The other filter valves including backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), filter to waste (BFV-242A, BFV-242B, BFV-242C), air scour supply (BFV-243A, BFV-243B, BFV-243C), and air draindown (BFV-243A, BFV-243B, BFV-243C) shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The backwash supply control valve (PRV-832) shall remain closed during the Filter Flow-Automatic. All valve positions (open/closed) shall be reported and displayed locally, remotely at the WTP MCP OIT, and in the SCADA system.

In the SCADA-Headloss mode, the operator shall select the maximum allowable filter headloss during normal forward flow (7 to 10 psi) individually for Filter #1, Filter #2, and Filter #3. The headloss across each filter shall be measured by a differential pressure transmitter (DPIT-214A, DPIT-214B, DPIT-214C). Differential pressure is displayed locally, remotely at the WTP MCP OIT, and in the SCADA system. A high differential pressure alarm during Filter Flow-Automatic and a low differential pressure alarm during backwash (operator selectable setpoint) shall be reported in the SCADA system. The actual filter run time shall be recorded and reported in the SCADA system. Filter runtime shall be reset after a filter backwash. The current filter runtime and previous filter runtime shall be displayed at the WTP MCP OIT and in the SCADA system.

In the SCADA-Filter Run Time mode, the operator shall select the maximum filter run time (1 to 48 hours) for Filter #1, Filter #2, and Filter #3. The actual filter runtime shall be recorded and reported in the SCADA system. Filter runtime shall be reset after a filter backwash. The current filter runtime and previous filter runtime shall be displayed at the WTP MCP OIT and in the SCADA system. The filter headloss shall be measured by a differential pressure transmitter (DPIT-214A, DPIT-214B, DPIT-214C). Differential pressure shall be displayed locally, at the WTP MCP OIT, and in the SCADA system. A high differential pressure alarm during Filter Flow-Automatic and a low differential pressure alarm during backwash (operator selectable setpoint) shall be reported in the SCADA system.

Filter Valve Positions – Filter Flow Loop (All Filters)		
Valve Description	Tag Nos.	Position
Filter Influent Control	BFV-236A, -236B, -236C	Modulating
Filter Effluent Control	BFV-238A, -238B, -238C	Open
Filter Backwash Supply	BFV-240A, -240B, -240C	Closed
Filter Backwash Waste	BFV-241A, -241B, -241C	Closed
Filter to Waste	BFV-242A, -242B, -242C	Closed
Air Scour Supply	BFV-243A, -243B, -243C	Closed
Air Draindown	BFV-244A, -244B, -244C	Closed
Backwash Supply Control	PRV-832	Closed
Air Scour Blower Drain Solenoid Valve	SV-256	Open

### Combined Fe/Mn Filtered Water Flow

Flow meters shall be provided on the WTP Well 2 & 3 raw and recycle piping (FIT-212) and combined Fe/Mn filter effluent (FIT-218). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall be operator selectable. An alarm shall be reported in the SCADA system if the Well 2 and Well 3 pumps (Well 2: P-100A & P-100B; Well 3: P-141) are energized and no flow is detected at the Wells 2 & 3 raw and recycle flow meter (FIT-212) after a 10 minute start-up delay (operator selectable). A no flow (via FIT-212) reading shall shut down the pre-filtration sodium hypochlorite metering pumps (MP-404 & MP-405). A no flow (via FIT-218) reading shall shut down the sodium bisulfite metering pumps (MP-603 and MP-604).

#### G. Fe/Mn Filter Backwash – General

Under normal operations, all three filters shall be active/online. Once a single filter meets an operator selectable headloss or run time set point (as set in the Filter Flow-Automatic loop description above), and the level reading (via LE/LIT-811A, LE/LIT-811B or LE/LIT-811C ) at the operator selected Backwash Waste Tank is lower than the “Backwash Start” setpoint (operator selectable), and the backwash supply flow meter (FIT-812) is reading no flow the filter backwash sequence will start while the other two filters maintain forward flow operations. Filter backwashing can also occur if the other two filters are offline.

The operator shall select the type of filter backwash procedure via the WTP MCP OIT or the SCADA system. Filter Backwash (Water Only) and Filter Backwash (Air/Water) shall be selected. All backwash sequences (described below) shall be automatically controlled by the SCADA system. The backwash sequence can also be initiated for a selected filter via “Start Backwash – Water Only”, “Start Backwash – Air/Water” buttons provided in the WTP MCP OIT and SCADA System. A filter in backwash mode shall be indicated at the WTP MCP OIT and in the SCADA system.

If the level reading (via LE/LIT-811A, LE/LIT-811B or LE/LIT-811C) at the operator selected Backwash Waste Tank is higher than the “Backwash Start” setpoint (operator selectable) when a backwash cycle is initiated, a backwash failure shall be reported in the SCADA system and the Filter Flow loop shall continue for 15 minutes (operator selectable) before trying the backwash sequence again. If the second (operator selectable) attempt at a backwash fails, the SCADA shall fail all filter valves to close on the filter in backwash mode. A Fe/Mn Filter Backwash failure alarm shall be reported in the SCADA system.

#### H. Fe/Mn Filter Backwash (Water Only)

Filter Backwash (Water Only) shall be controlled automatically by the SCADA system. All equipment selector switches and/or integral controls must be in “AUTO” or “REMOTE” positions/modes for SCADA control. The filter washwater source shall be the water distribution system. Upon backwash initiation, the backwash supply control

valve (PRV-832) shall modulate to achieve the required backwash flow rate (operator selectable) as measured via the backwash supply flow meter (FIT-812). The individual filter backwash supply valve (BFV-240A, BFV-240B, BFV-240C) shall open.

If the required backwash flow rate as measured via the backwash supply flow meter (FIT-812) cannot be achieved or the control valves (PRV-832, BFV-240A, BFV-240B, BFV-240C) do not open when a backwash is initiated, a backwash failure shall be reported in the SCADA system and the Filter Flow loop shall continue for 15 minutes (operator selectable) before trying the backwash sequence again. If the second (operator selectable) attempt at a backwash fails, the SCADA system shall fail all filter valves to close on the filter in backwash mode. A Fe/Mn Filter Backwash (Water Only) failure alarm shall be reported in the SCADA system. All actuated filter valve positions (open/closed) and all modulating actuated filter valve %OPEN readings shall be reported remotely at the WTP MCP OIT and in the SCADA system.

#### Fe/Mn Filter Washwater Supply

The online filters not in backwash mode shall keep their respective filter effluent control valves (BFV-238A, BFV-238B, BFV-238C) open and resume forward flow. The SCADA system shall assess the backwash flow requirement with the feedback from the backwash supply flow meter (FIT-812). If the distribution system can meet the backwash flow requirement (465 gpm +/- per filter, operator selectable), the backwash sequence shall initiate. The effluent valve (BFV-238A, BFV-238B or BFV-238C) of the Fe/Mn filter in backwash mode shall close, and the individual filter backwash control valve (BFV-240A, BFV-240B, BFV-240C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the backwash flow rate requirement of the filter in backwash mode of 465 gpm (operator selectable ) as measured by the backwash supply flow meter (FIT-812) during the backwash cycle. The SCADA system shall compare the backwash flow requirement with the feedback from the backwash supply flow meter (FIT-812). During normal filter run mode, the total Wells 2 & 3 raw and recycle flow (FIT-212) shall be evenly divided between the on-line filters per the individual filter flow rate set point. When a backwash sequence for a Fe/Mn filter is initiated, the total Wells 2 & 3 raw and recycle flow (via FIT-212) shall be evenly divided between the remaining online filter running in Filter Mode, measured via the dedicated filter flow meter (FIT-213A, FIT-213B, FIT-213C).

If the backwash supply control valve (PRV-832) modulated via the backwash supply flow meter (FIT-812) cannot meet the backwash flow requirement (465 gpm; operator selectable), the SCADA system shall fail all filter valves closed on the filter that triggered the backwash. A Filter Backwash (Water Only) alarm shall be reported in the SCADA system. The other online filters shall resume Filter Flow and shall divide the total raw and recycle water flow evenly (via FIT-213A, FIT-213B, FIT-213C). The other online filter valves including backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), filter to waste (BFV-242A, BFV-242B, BFV-242C), air scour supply (BFV-243A, BFV-243B, BFV-243C), and air draindown (BFV-244A, BFV-244B, BFV-244C) shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

For the Bed Settle sequence all filter valves (backwashing filter only) shall close.

For the Filter to Waste sequence, the total Wells 2 & 3 raw and recycle flow (FIT-212) shall be evenly divided between the filter in backwash mode and the remaining online filters. The filter to waste valve (BFV-236A, BFV-236B, BFV-236C) of the filter in backwash mode shall open. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) shall open to achieve the filter flow set point modulated via the individual filter flow meter (FIT-213A, FIT-213B, FIT-213C). The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) %OPEN shall be reported at the WTP MCP OIT and in the SCADA system. The well pump speeds shall not vary from normal Filter Flow operations. The influent valves (BFV-236A, BFV-236B, BFV-236C) on the on-line filters shall open to an operator selectable Filter to Waste position (%OPEN) to evenly divide the remaining raw water flow.

#### Fe/Mn Filter Backwash

The SCADA system shall fully close the filter influent control valve (BFV-236A, BFV-236B, BFV-236C) corresponding with the filter in backwash mode. The SCADA system shall keep the backwash supply valve (BFV-240A, BFV-240B, BFV-240C) corresponding with the filter in backwash mode open. The filter backwash waste valve (BFV-241A, BFV-241B, BFV-241C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the backwash flow rate requirement of the filter in backwash mode of 465 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812). The filter backwash cycle duration shall be based on a SCADA timer (10 minutes; operator selectable) per the recommendation of the filter manufacturer. The filter effluent (BFV-238A, BFV-238B, BFV-238C), filter to waste (BFV-242A, BFV-242B, BFV-242C), air draindown (BFV-244A, BFV-244B, BFV-244C), and air scour supply (BFV-243A, BFV-243B, BFV-243C) valves shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

Filter Valve Positions – Filter in Backwash		
<u>Valve Description</u>	<u>Tag Nos.</u>	<u>Position</u>
Filter Influent Control	BFV-236A, -236B, -236C	Closed
Filter Effluent Control	BFV-238A, -238B, -238C	Closed
Filter Backwash Supply	BFV-240A, -240B, -240C	Open
Filter Backwash Waste	BFV-241A, -241B, -241C	Open
Filter to Waste	BFV-242A, -242B, -242C	Closed
Filter Air Scour Supply	BFV-243A, -243B, -243C	Closed
Filter Air Draindown	BFV-244A, -244B, -244C	Closed
Backwash Supply Control	PRV-832	Open
Air Scour Blower Drain Solenoid Valve	SV-256	Open

#### Fe/Mn Filter Bed Settle

After the backwash cycle, the filter shall then enter a bed settle cycle and all filter valves (backwashing filter only) and backwash supply control valve (PRV-832) shall

close. Refer to the Bed Settle loop description in Washwater Supply above. The bed settle cycle duration shall be based on a SCADA timer (2 minutes; operator selectable) per the recommendation of the filter manufacturer. The air scour blower drain valve (SV-256) shall remain open. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

Filter Valve Positions – Filter in Bed Settle		
<u>Valve Description</u>	<u>Tag Nos.</u>	<u>Position</u>
Filter Influent Control	BFV-236A, -236B, -236C	Closed
Filter Effluent Control	BFV-238A, -238B, -238C	Closed
Filter Backwash Supply	BFV-240A, -240B, -240C	Closed
Filter Backwash Waste	BFV-241A, -241B, -241C	Closed
Filter to Waste	BFV-242A, -242B, -242C	Closed
Filter Air Scour Supply	BFV-243A, -243B, -243C	Closed
Filter Air Draindown	BFV-244A, -244B, -244C	Closed
Backwash Supply Control	PRV-832	Closed
Air Scour Blower Drain Solenoid Valve	SV-256	Open

#### Fe/Mn Filter to Waste

After the Bed Settle cycle has been completed, the filter in backwash mode shall go into the filter to waste cycle. Refer to the Filter to Waste loop description in Washwater Supply described above.

The filter influent valve (BFV-236A, BFV-236B, BFV-236C) of the filter in backwash mode shall open to achieve the filter flow set point modulated via the individual filter flow meter (FIT-213A, FIT-213B, FIT-213C). The Filter to Waste valve (BFV-242A, BFV-242B, BFV-242C) shall open. The filter to waste cycle duration shall be based on a SCADA timer (3 minutes; operator selectable) per the recommendations of the filter manufacturer. During the filter to waste cycle, the filter effluent (BFV-238, BFV-238B, BFV-238C), backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), air scour supply (BFV-243A, BFV-243B, BFV-243C), and air draindown (BFV-244A, BFV-244B, BFV-244C) valves shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

Filter Valve Positions – Filter in Filter to Waste		
<u>Valve Description</u>	<u>Tag Nos.</u>	<u>Position</u>
Filter Influent Control	BFV-236A, -236B, -236C	Modulating
Filter Effluent Control	BFV-238A, -238B, -238C	Closed

Filter Valve Positions – Filter in Filter to Waste		
Valve Description	Tag Nos.	Position
Air Scour Blower Drain Solenoid Valve	SV-256	Open

#### Return to Fe/Mn Filter Flow

After Filter Backwash (Water Only) procedures are completed, the SCADA system shall begin a 2-hour “Backwash Settle” timer (operator selectable). The backwash supply control valve (PRV-832), the filter backwash supply control valve (BFV-240A, 240B, 20C), and filter to waste valve (BFV-242A, BFV-242B, BFV-242C) shall close. The Filter Influent Control Valve (BFV-236A, BFV-236B, BFV-236C) will remain open and the remaining filter valves shall return to the original Filter Flow mode (Manual, SCADA-Headloss, or SCADA-Filter Run Time).

#### I. Fe/Mn Filter Backwash (Air/Water)

Filter Backwash (Air/Water) shall be controlled automatically by the SCADA system. All equipment selector switches and integral controls must be in “AUTO” or “REMOTE” positions/modes for SCADA control. The filter washwaster and slow refill source shall be the finished water distribution system. The filter air draindown and air scour supply source shall be the air scour blower (ASB-202). Upon backwash initiation, the backwash supply control valve (PRV-832) shall modulate to achieve the required backwash flow rate (operator selectable) as measured via the backwash supply flow meter (FIT-812). The individual filter backwash supply valve (BFV-240A, BFV-240B, BFV-240C) shall open.

If the required backwash flow rate as measured via the backwash supply flow meter (FIT-812) cannot be achieved or the control valves (PRV-832, BFV-240A, BFV-240B, BFV-240C) do not open when a backwash is initiated, a backwash failure shall be reported in the SCADA system and the Filter Flow loop shall continue for 15 minutes (operator selectable) before trying the backwash sequence again. If the second (operator selectable) attempt at a backwash fails, the SCADA system shall fail all filter valves to close on the filter in backwash mode. A Fe/Mn Filter Backwash (Air/Water) failure shall be reported in the SCADA system. All actuated filter valve positions (open/closed) and all modulating actuated filter valve %OPEN readings shall be reported remotely at the WTP MCP OIT and in the SCADA system.

#### Fe/Mn Filter Washwater Supply

The online filters not in backwash mode shall keep their respective filter effluent control valves (BFV-238A, BFV-238B, BFV-238C) open and maintain forward flow. The SCADA system shall assess the backwash flow requirement with feedback from the backwash supply flow meter (FIT-812). If the distribution system can meet the backwash flow requirement (465 gpm +/- per filter, operator selectable), the backwash sequence shall initiate. The effluent valve (BFV-238A, BFV-238B or BFV-238C) of the Fe/Mn filter in backwash mode shall close, and the individual filter backwash control valve (BFV-240A, BFV-240B, BFV-240C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the backwash flow rate requirement

of the filter in backwash mode of 465 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812) during the backwash cycle. The SCADA system shall compare the backwash flow requirement with the feedback from the backwash supply flow meter (FIT-812). During normal filter run mode, the total Wells 2 & 3 raw and recycle flow (FIT-212) shall be evenly divided between the on-line filters per the individual filter flow rate set point. When a backwash sequence for a Fe/Mn filter is initiated, the total Wells 2 & 3 raw and recycle flow (via FIT-212) shall be evenly divided between the remaining online filter running in Filter Mode, measured via the dedicated filter flow meter (FIT-213A, FIT-213B, FIT-213C).

If the backwash supply control valve (PRV-832) modulated via FIT-812 cannot meet the backwash flow requirement (465 gpm), the SCADA system shall fail all filter valves closed on the filter that triggered the backwash. A Filter Backwash (Air/Water) alarm shall be reported in the SCADA system. The other online filters shall resume Filter Flow and shall divide the total raw and recycle water flow evenly (via FIT-213A, FIT-213B, FIT-213C). The other online filter valves including backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), filter to waste (BFV-242A, BFV-242B, BFV-242C), air scour supply (BFV-243A, BFV-243B, BFV-243C), and air draindown (BFV-244A, BFV-244B, BFV-244C) shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

For the Slow Refill sequence, the distribution system shall remain the washwater supply. The backwash supply control valve (PRV-832) shall modulate to meet the slow refill flow rate requirement of the filter in backwash mode of 155 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812) during the backwash cycle.

For the Air/Water Wash sequence, the well pumps shall remain online at the Filter Backwash flow rate (950 gpm, operator adjustable). The influent control valve (BFV-435A, BFV-435B, BFV-435C, BFV-435D) of the on-line filters shall modulate to meet the combined air/wash water flow rate requirement of 310 gpm (operator adjustable). The remaining on-line filters shall resume Filter Flow and shall divide the total flow evenly. The filtered water pressure sustaining valve (PSV-450) shall remain in the open position. The effluent control valve (BFV-438A, BFV-438B, BFV-438C, BFV-438D) of the on-line filters shall be open/closed. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

For the Bed Settle sequence, all filter valves (backwashing filter only) shall close.

For the Filter to Waste sequence, the total Wells 2 & 3 raw and recycle flow (FIT-212) shall be evenly divided between the filter in backwash mode and the remaining online filters. The filter to waste valve (BFV-236A, BFV-236B, BFV-236C) of the filter in backwash mode shall open. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) shall open to achieve the filter flow set point modulated via the individual filter flow meter (FIT-213A, FIT-213B, FIT-213C). The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) %OPEN shall be reported at the WTP MCP OIT and in the SCADA system. The well pump speeds shall not vary from normal Filter

Flow operations. The influent valves (BFV-236A, BFV-236B, BFV-236C) on the on-line filters shall open to an operator selectable Filter to Waste position (%OPEN) to evenly divide the remaining raw water flow.

Fe/Mn Filter Draindown

The filter in backwash mode shall close the filter influent control valve (BFV-236A, BFV-236B, BFV-236C) and filter effluent control valve (BFV-238A, BFV-238B, BFV-238C). The SCADA system shall send a start signal to the blower (ASB-202). Blower status shall be reported at the MCP OIT and in the SCADA system. After a 15 second delay (operator selectable), the filter draindown air valve (BFV-244A, BFV-244B, BFV-244C) and filter to waste valve (BFV-242A, BFV-242B, BFV-242C) shall open. The air scour blower solenoid valve (SV-256) shall close. The draindown cycle duration shall be based on a SCADA timer (5 minutes; operator selectable) per the recommendations of the filter manufacturer and as determined during startup. The other filter valves including backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), and air scour supply (BFV-243A, BFV-243B, BFV-243C) shall remain closed. The valve positions (open/closed) shall be reported remotely at the MCP OIT and in the SCADA system.

Filter Valve Positions – Filter in Draindown

Fe/Mn Filter Air Scour

After the draindown cycle, the filter shall enter the air scour cycle. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C), filter effluent control valve (BFV-238A, BFV-238B, BFV-238C), and air scour blower drain valve (SV-256) shall remain closed. The air draindown valve (BFV-244A, BFV-244B, BFV-244C) and filter to waste valve (BFV-242A, BFV-242B, BFV-242C) shall close from the previous step. The air scour blower (ASB-202) shall remain energized from the previous step. The filter air scour supply valve (BFV-243A, BFV-243B, BFV-243C) shall open. The air scour cycle duration shall be based on a SCADA timer (2 minutes; operator selectable) per the recommendations of the filter manufacturer. The other filter valves including backwash supply (BFV-240A, BFV-240B, BFV-240C) and backwash waste (BFV-241A, BFV-241B, BFV-241C) shall remain closed. The valves positions (open/closed) shall be reported remotely at the MCP OIT and in the SCADA system.

#### Fe/Mn Filter Air/Water Wash

After the air scour cycle, the filter shall enter the air/water wash cycle. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) and filter effluent control valve (BFV-238A, BFV-238B, BFV-238C) shall remain closed. The filter backwash waste valve (BFV-241A, BFV-241B, BFV-241C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the backwash flow rate requirement of the filter in backwash mode of 465 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812). The air scour blower (ASB-202) shall remain energized from the previous step. The filter air scour supply valve (BFV-243A, BFV-243B, BFV-243C) shall remain open. The air/water wash cycle duration shall be based on a SCADA timer (3 minutes; operator selectable in minutes) per the recommendations of the filter manufacturer. The other filter valves including filter to waste (BFV-242A, BFV-242B, BFV-242C) and filter air draindown (BFV-244A, BFV-244B, BFV-244C) shall remain closed. The valve positions (open/closed) shall be reported remotely at the MCP OIT and in the SCADA system.

#### Fe/Mn Filter Slow Refill

After the air/wash cycle, the filter shall enter the slow refill cycle. Refer to the Slow Refill loop description in Washwater Supply above. The filter influent control valve (BFV-236A, BFV-236B, BFV-236C) and filter effluent control valve (BFV-238A, BFV-238B, BFV-238C) shall remain closed. The air scour blower (ASB-202) shall

de-energize from the previous step by the SCADA system and the filter air scour supply valve (BFV-243A, BFV-243B, BFV-243C) shall close. The air scour blower drain valve (SV-256) shall open. The filter backwash waste valve (BFV-241A, BFV-241B, BFV-241C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the slow refill flow rate requirement of the filter in backwash mode of 155 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812). The slow refill cycle duration shall be based on a SCADA timer (2 minutes; operator selectable) per the recommendations of the filter manufacturer. The other filter valves including backwash waste (BFV-241A, BFV-241B, BFV-241C), filter to waste (BFV-242A, BFV-242B, BFV-242C), and air draindown (BFV-244A, BFV-244B, BFV-244C) shall remain closed. The valve positions (open/closed) shall be reported remotely at the MCP OIT and in the SCADA system.

#### Fe/Mn Filter Backwash

After the slow refill cycle, the filter influent control valve (BFV-236A, BFV-236B, BFV-236C) and filter effluent control valve (BFV-238A, BFV-238B, BFV-238C) shall remain closed. The filter backwash waste valve (BFV-241A, BFV-241B, BFV-241C) shall open. The backwash supply control valve (PRV-832) shall modulate to meet the backwash flow rate requirement of the filter in backwash mode of 465 gpm (operator selectable) as measured by the backwash supply flow meter (FIT-812). The backwash cycle duration shall be based on a SCADA timer (10 minutes; operator selectable) per the recommendations of the filter manufacturer. The filter valves including filter to waste valve (BFV-242A, BFV-242B, BFV-242C), air scour supply (BFV-243A, BFV-243B, BFV-243C) and air draindown valve (BFV-244A, BFV-244B, BFV-244C) shall remain closed, while the air scour blower drain valve (SV-256) shall remain in the open position. The valve positions (open/closed) shall be reported remotely at the MCP OIT and in the SCADA system.

#### Fe/Mn Filter Bed Settle

After the backwash cycle, the filter shall then enter a bed settle cycle and all filter valves (backwashing filter only) and backwash supply control valve (PRV-832) shall close. Refer to the Bed Settle loop description in Washwater Supply above. The bed settle cycle duration shall be based on a SCADA timer (2 minutes; operator selectable) per the recommendation of the filter manufacturer. The air scour blower drain valve (SV-256) shall remain open. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

Air Scour Blower Drain Solenoid Valve	SV-256	Open

#### Fe/Mn Filter to Waste

After the Bed Settle cycle has been completed, the filter in backwash mode shall go into the filter to waste cycle. Refer to the Filter to Waste loop description in Washwater Supply described above.

The filter influent valve (BFV-236A, BFV-236B, BFV-236C) of the filter in backwash mode shall open to achieve the filter flow set point as reported by via the individual filter flow meter (FIT-213A, FIT-213B, FIT-213C). The Filter to Waste valve (BFV-242A, BFV-242B, BFV-242C) shall open. The filter to waste cycle duration shall be based on a SCADA timer (3 minutes; operator selectable) per the recommendations of the filter manufacturer. During the filter to waste cycle, the filter effluent (BFV-238, BFV-238B, BFV-238C), backwash supply (BFV-240A, BFV-240B, BFV-240C), backwash waste (BFV-241A, BFV-241B, BFV-241C), air scour supply (BFV-243A, BFV-243B, BFV-243C), and air draindown (BFV-244A, BFV-244B, BFV-244C) valves shall remain closed, while the air scour blower drain valve (SV-256) shall

remain in the open position. The valve positions (open/closed) shall be reported remotely at the WTP MCP OIT and in the SCADA system.

Filter Valve Positions – Filter in Filter to Waste

#### Return to Fe/Mn Filter Flow

After Filter Backwash (Air/Water) procedures are completed, the SCADA system shall begin a 2-hour “Backwash Settle” timer (operator selectable). The backwash supply control valve (PRV-832), the filter backwash supply control valve (BFV-240A, 240B, 20C) and filter to waste valve (BFV-242A, BFV-242B, BFV-242C) shall close. The Filter Influent Control Valve (BFV-236A, BFV-236B, BFV-236C) will remain open and the remaining filter valves shall return to the original Filter Flow mode (Manual, SCADA-Headloss, or SCADA-Filter Run Time).

#### J. Backwash Supply Control Valve (PRV-832)

The backwash supply control valve (PRV-832) shall be controlled by a valve controller furnished by the valve manufacturer. The SCADA system shall send an operator selectable flow rate set point to the valve controller for the following flow conditions:

1. Fe/Mn Filter Backwash: 465 gpm
2. Fe/Mn Filter Slow Refill: 465 gpm
3. GAC Filter Backwash: 945 gpm
4. IX Filter Backwash: 100 gpm

The operator will be able to manually set the desired flow rate through the backwash supply control valve to facilitate manual GAC and IX filter backwashes. The valve controller shall modulate the valve position using influent and effluent solenoid valves (SV-832A, SV-832B) to pace the flow rate measured by the backwash supply flow meter (FIT-812). Two backwash supply control valve alarms shall be reported in the SCADA system from the valve controller.

#### K. Bag Filters

A PFAS Treatment Influent flow meter shall be provided on the combined PFAS influent piping (FIT-311). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall be operator selectable. A no flow (via FIT-311) reading for 90 seconds (operator selectable) shall shut down the potassium hydroxide metering pumps (MP-503 and MP-504).

The WTP combined PFAS influent flow is directed through three parallel bag filter housings (BF-201A, BF-201B, BF-201C) prior to PFAS removal. The differential pressure across the bag filters shall be measured by a differential pressure transmitter (DPIT-215). Differential pressure is displayed locally, remotely at the WTP MCP OIT, and in the SCADA system. A high differential pressure alarm (operator selectable set point) shall be reported in the SCADA system.

#### L. PFAS Lead and Lag Filters

A flow meter shall be provided on the influent piping for each Lead-Lag PFAS train (FIT-319A, FIT-319B, FIT-319C). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. PFAS train throughput (million gallons) shall be totalized and stored in the SCADA system for each Lead-Lag PFAS train (via FIT-319A, FIT-319B, FIT-319C). The throughput totalizers shall be reset manually in the SCADA system after each media changeout.

Differential pressure transmitters shall be provided for each Lead PFAS vessel (PF-300A, PF-300B, PF-300C) (DPIT-313A, DPIT-313B, DPIT-313C, respectively) and each Lag PFAS vessel (PF-301A, PF-301B, PF-301C) (DPIT-315A, DPIT-315B, DPIT-315C, respectively). Differential pressure transmitters measure, locally indicate, and transmit PFAS vessel differential pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and low PFAS vessel differential pressure. The alarm set points shall be operator selectable.

Pressure transmitters shall be provided on the inlet piping for each Lead PFAS vessel (PF-300A, PF-300B, PF-300C) (PIT-316A, PIT-316B, PIT-316C, respectively) and each Lag PFAS vessel (PF-301A, PF-301B, PF-301C) (PIT-317A, PIT-317B, PIT-317C, respectively). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and high-high PFAS vessel influent pressure. The alarm set points shall be operator selectable.

#### M. PFAS Treatment Effluent Flow

A flow meter shall be provided on the combined PFAS treatment effluent piping (FIT-312). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall

be operator selectable. A no flow (via FIT-312) reading shall shut down the post-filtration sodium hypochlorite metering pumps (MP-407 and MP-408) and the sodium fluoride metering pump (MP-651).

#### N. Pressure Sustaining Valves

A pressure transmitter shall be provided on the FWWW influent piping (PIT-318) and Well 4 pump discharge piping (PIT-177). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and low pressure. The alarm set points shall be operator selectable.

Two parallel pressure sustaining valves (PSV-348A, PSV-348B) located on the combined filtered water shall maintain an operator selectable upstream pressure (via PIT-318). During normal operations, only one pressure sustaining valve shall operate at a time. The offline pressure sustaining valve shall be isolated from the process flow with manual valves. The pressure sustaining valve (PSV-348A, PSV-348B) open and close positions shall be controlled by the SCADA system via a three-way solenoid valve (SV-348A, SV-348B). The solenoid valve shall be de-energized to close the valve. When the solenoid valve (SV-348A, SV-348B) is energized, the pressure sustaining valve inlet pressure shall be controlled by an integral pilot valve, which shall have a pressure range of 0 to 75 psi. The pilot valve set point shall be manually set during startup. During operation, the valve open position shall be adjustable via the SCADA system to achieve an operator selectable upstream pressure set point, within an allowable range (+/- 2 psi). Pressure sustaining valve open position (0-100%) (ZIT-348A, ZIT-348B), fully closed (ZSC-348A, ZSC-348B), and fully open (ZSO-348A, ZSO-348B) positions shall be reported in the SCADA system. The pressure sustaining valve (PSV-348A, PSV-348B) shall close fully before the well pumps shut down.

#### O. Finished Water Wet Well and Finished Water Pumps

Finished water shall be pumped from the FWWW into the distribution system via three (3) finished water pumps (P-700A, P-700B, P-700C) operating in a lead, lag, standby configuration. The pump motor speeds shall be controlled by VFDs (VFD-700A, VFD-700B and VFD-700C) located in the WTP electrical room (Room 111). Each VFD is provided with a H-O-A selector switch. In the HAND (manual) mode, the operator can locally adjust the motor speed by the corresponding VFD keypad using local buttons to increase/decrease motor speed (0 to 100%). Motor speed (%) and hertz (0 to 60 Hz) are indicated locally on the VFD display; and remotely on the WTP MCP OIT and in the SCADA system. In the AUTO (remote) mode, the motor speed of the finished water pump shall be controlled automatically by the SCADA system.

In order for the finished water pumps to run in AUTO mode, the corresponding VFD H-O-A selector switch shall be in the AUTO position. The finished water pumps (P-700A, P-700B and P-700C) shall primarily operate based on the finished water wet well water level and the Upland Road Storage Tank water level. The finished water pump (P-700A, P-700B and P-700C) shall automatically de-energize if the water level in the Upland Road Storage Tank reaches an operator-selectable "OFF" level set point

and shall be automatically energized by the finished water pump VFDs if the Upland Road Storage Tank water level drops to the water storage tank level “ON” set point.

The finished water pumps (P-700A, P-700B and P-700C) speed is controlled via their respective VFDs (VFD-700A, VFD-700B and VFD-700C) located in the electrical room (Room 111). The finished water pumps (P-700A, P-700B and P-700C) shall run at operator selectable high and low speed set points, as selected at the WTP MCP OIT or in the SCADA system.

A level indicating transmitter shall be provided in the FWWW (LIT-711). Level transmitters measure, locally indicate, and transmit level both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and low FWWW level. The alarm set points shall be operator selectable.

The finished water pumps (P-700A, P-700B and P-700C) shall also operate based on the FWWW level. The pumps shall automatically de-energize if the water level in the finished water wet well drops to an operator-selectable “Finished Water Pump Off” level set point (via LIT- 711). The finished water pump lead, lag, standby status shall alternate every pumping cycle.

The lead finished water pump shall default a high speed set point (operator selectable) upon facility start-up. The lag finished water pump shall start at a low speed, controlled by the finished water pump VFD, when the level in the FWWW rises to “Lag Pump On” level setpoint (via LIT-711, operator selectable). If the water level in the FWWW rises to the “Lag Pump High Speed” level set point (via LIT-711; operator selectable), the finished water pump VFD shall increase the lag finished water pump speed to the high speed set point.

Float switches shall be provided in the FWWW (LSH-712A, LSL-712B). If the water level in the FWWW reaches the high-high level float switch (LSH-712A), the SCADA system shall de-energize the well pumps (Well 2: P-100A, P-100B; Well 3: P-141; Well 4: P-171) and recycle pumps (P-800A, P-800B), and a high-high FWWW level alarm shall be reported in the SCADA system. If the water level in the FWWW drops to the low-low level float switch (LSL-712B), the SCADA system shall de-energize the finished water pumps (P-700A, P-700B and P-700C) and a low-low FWWW level alarm shall be reported in the SCADA system.

Daily pump runtime and total runtime shall be logged and displayed in the SCADA system for each finished water pump. The finished water pump VFDs (VFD-700A, VFD-700B and VFD-700C) shall report respective pump speeds in the SCADA system. Finished water pump fault and high temperature (via VFD-700A, VFD-700B and VFD-700C) shall be alarms reported in the SCADA system.

Daily (gallons) and total (million gallons) finished water volumes shall be totalized and stored in the SCADA system by combining flow readings from FIT-714A, FIT-714B and FIT-714C. A running annual average totalizing the finished water production (million gallons) for a duration of four (4) consecutive billing quarters shall be stored in the SCADA system (via combined flow reading from FIT-714A, FIT-714B and FIT-

714C). An alarm shall be reported in the SCADA system if the combined daily finished water production of 1.85 MG (operator selectable) is exceeded in a single calendar day (12:00 AM to 11:59 PM). The total daily finished water production shall be reported in gallons. The daily finished water totalizer shall reset at 12:00 AM each day.

The finished water pumps shall shut off based on Upland Road storage tank level or the finished water wetwell level.

Finished Water Wet Well Set Points		
Description	Elevation (feet NAVD88)	Water Depth (feet)
High-High Wetwell Level (via LSH-712A)	223.5	9.3
High Wetwell Level (via LIT-711)	223.0	8.8
Well Pumps Off (via LIT-711)	221.3	7.1
Lag Finished Water Pump High Speed (via LIT-711)	220.3	6.1
Lag Finished Water Pump On, Low Speed (via LIT-711)	219.8	5.6
Lag Finished Water Pump Off (via LIT-711)	219.3	5.1
Well Pumps On (via LIT-711)	218.8	4.6
Lead Finished Water Pump Off (via LIT-711)	218.5	4.3
Low Wetwell Level (via LIT-711)	218.2	4.0
Low-Low Wetwell Level (via LSL-712A)	217.7	3.5

P. Finished Water Flow and Pressure

Flow meters shall be provided on the finished water pump discharge piping (FIT-714A, FIT-714B, FIT-714C). Flow meters measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow and no flow. The high flow alarm set point shall be operator selectable. If the finished water pumps (P-700A, P-700B, P-700C) are energized and no flow is detected (via FIT-714A, FIT-714B, FIT-714C, respectively) after a 90 second start-up delay (operator selectable), the SCADA system shall de-energize the finished water pumps and an alarm shall be reported in the SCADA system.

Pressure transmitters shall be provided on the finished water pump discharge piping (PIT-713A, PIT-713B, PIT-313C). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for low, high, and high-high discharge pressure. The alarm set points shall be operator selectable. The finished water pumps (P-700A, P-700B, P-700C) shall be de-energized by the SCADA system for high-high discharge pressure (via PIT-713A, PIT-713B, PIT-313C, respectively).

Q. Backwash Waste Tank, Recycle Pumps and Sludge Pumps

Backwash Waste Tank

Filter backwash waste (backwash waste and filter to waste) from backwashed Fe/Mn filters and PFAS filters shall be directed into one of three Backwash Waste Tank

(BWWT) compartments located in the WTP lower level. The WTP water quality analyzer and sample sink flows shall also discharge by gravity into the BWWT.

Ultrasonic level transmitters (LIT-811A, LIT-811B, LIT-811C) in the BWWT compartments shall monitor the liquid level in each compartment, which shall report a high and low alarms (operator selectable) in the SCADA system. The BWWT level (LIT-811A, LIT-811B, LIT-811C) shall be displayed locally, at the Sludge Pump Field Control Panel (SP-FCP), at the MCP OIT, and in the SCADA system. Backwash waste volume produced shall be measured in the SCADA system via backwash waste tank level, as measured by LIT-811A, LIT-811B, LIT-811C. The SCADA system shall log the backwash waste tank levels at the start and end of each backwash cycle and calculate the difference in volume based on gallons per foot calculations, which shall be determined during startup.

High-high level switches (LSH-815A, LSH-815B, LSH-815C) in the BWWT compartments shall report a high-high alarm in the SCADA system. If the water level in the “BACKWASH ONLINE” BWWT compartment reaches the high-high level (measured via LSH-815A, LSH-815B, LSH-815C) and an Fe/Mn or PFAS filter backwash is in progress, the SCADA system shall end the backwash cycle, fail the filter valves closed (for the filter in backwash only), and close the corresponding backwash waste tank isolation valve (BFV-834A, BFV-834B, BFV-834C). Backwash Fail and BWWT Compartment High-High Level alarms shall be reported in the SCADA system.

Low-low level switches (LSL-816A, LSL-816B, LSL-816C) in the BWWT compartments shall report a low-low alarm in the SCADA system. If the water level in the “RECYCLE ONLINE” BWWT reaches the low-low level (measured via LSL-816A, LSL-816B, LSL-816C) and a recycle pump (P-800A, P-800B) is running, the SCADA system shall close the corresponding recycle backwash tank waste isolation valve (BFV-836A, BFV-836B, BFV-836C) and de-energize the active recycle pump (P-800A, P-800B). Recycle Pump Fault and BWWT Compartment Low-Low Level alarms shall be reported in the SCADA system.

The backwash waste tanks shall operate in one of two operator selectable modes: SCADA-Hand or SCADA-Automatic.

#### *SCADA-Hand*

At the MCP OIT or the SCADA server, the operator shall select the SCADA-Hand Mode. When in SCADA-Hand mode, the operator shall select the “BACKWASH ONLINE” and “RECYCLE ONLINE” BWWT compartments for manual operation. The corresponding backwash waste tank isolation valve (BFV-834A, BFV-834B, BFV-834C) of the “BACKWASH ONLINE” BWWT compartment shall open; and the corresponding recycle backwash waste tank isolation valve (BFV-836A, BFV-836B, BFV-836C) of the “RECYCLE ONLINE” BWWT compartment shall open.

#### *SCADA-Automatic*

At the MCP OIT or the SCADA server, the operator shall select the SCADA-Automatic Mode. When in SCADA-Automatic Mode, the active backwash waste tank compartments shall cycle based on liquid level in the compartment. Upon initiation of

the SCADA-Automatic mode, the operator shall select the “BACKWASH ONLINE” and “RECYCLE ONLINE” BWWT compartments for automatic operation. The corresponding backwash waste tank isolation valve (BFV-834A, BFV-834B, BFV-834C) of the “BACKWASH ONLINE” BWWT compartment shall open; and the corresponding recycle backwash waste tank isolation valve (BFV-836A, BFV-836B, BFV-836C) of the “RECYCLE ONLINE” BWWT compartment shall open.

If the water level in the “BACKWASH ONLINE” BWWT compartment reaches the backwash max level (measured via LIT-811A, LIT-811B, LIT-811C) and an Fe/Mn or PFAS filter backwash is not in progress, the SCADA system shall automatically select the next BWWT compartment (BWWT #1, BWWT #2, BWWT #3) as the “BACKWASH ONLINE” compartment and open the corresponding backwash waste tank isolation valve and close the previously active backwash waste tank isolation valve (BFV-834A, BFV-834B, BFV-834C).

If the water level in the “RECYCLE ONLINE” BWWT compartment reaches the recycle pump stop level (measured via LIT-811A, LIT-811B, LIT-811C) and the water level in the “BACKWASH ONLINE” BWWT compartment reaches the backwash max level (measured via LIT-811A, LIT-811B, LIT-811C), the SCADA system shall automatically select the next BWWT compartment (BWWT #1, BWWT #2, BWWT #3) as the “RECYCLE ONLINE” compartment and open the corresponding recycle backwash waste tank isolation valve and close the previously active recycle backwash waste tank isolation valve (BFV-836A, BFV-836B, BFV-836C).

The “RECYCLE ONLINE” and “BACKWASH ONLINE” compartments (BWWT #1, BWWT #2, BWWT #3) shall not be the same tank.

### Recycle Pumps

Settled backwash waste shall be pumped from the BWWT to the Wells 2 & 3 raw water WTP influent via two (2) recycle pumps (P-800A, P-800B) operating in a duty-standby configuration. The pump motor speeds shall be controlled by VFDs (VFD-800A, VFD-800B) located in the WTP electrical room (Room 111). Each VFD is provided with an H-O-A selector switch. In the HAND (manual) mode, the operator can locally adjust the motor speed by the corresponding VFD keypad using local buttons to increase/decrease motor speed (0 to 100%). Motor speed (%) and hertz (0 to 60 Hz) are indicated locally on the VFD display; and remotely on the WTP MCP OIT and in the SCADA system. In the AUTO (remote) mode, the motor speed of the finished water pump shall be controlled automatically by the SCADA system.

To operate the recycle pump automatically via the SCADA system the operator shall select an “AUTO” button located in the SCADA system or the MCP OIT. When the “AUTO” button is selected, the recycle backwash waste tank isolation valve (BFV-836A, BFV-836B, BFV-836C) located in the decanter pipe of the “ONLINE” BWWT compartment shall open and the recycle pump (P-800A and P-800B) shall run only if the level (measured via LIT-811A, LIT-811B, LIT-811C) at the backwash waste tank is at “Recycle Pump Start” setpoint or higher AND the “Backwash Settle” timer has expired.

The recycle pumps and the corresponding recycle backwash waste tank isolation valve shall automatically shut down and close if all well pump statuses (P-100A, P-100B, P-141, P-171) are reported in the SCADA system to be OFF, the Wells 2 & 3 raw and recycle flow meter (FIT-212) reads less than 100 gpm (operator selectable), the backwash waste tank level reaches the “Recycle Pump Stop” set point (operator selectable via LIT-811A, LIT-811B, LIT-811C), or a Fe/Mn filter enters backwash mode.

The Recycle Pumps speed set point is dependent on the Wells 2 & 3 raw water influent flow (via FIT-212). The recycle pump VFDs shall adjust the recycle pump speed such that the recycle flow (via FIT-813) equals 5% of Wells 2 & 3 raw water flow (via FIT-212). Recycle water pump fault and high temperature (via VFD-800A and VFD-800B) alarms shall be reported in the SCADA system. FIT-813 shall measure recycle water flow, and the flow rate shall be displayed locally, and remotely at the MCP OIT and in the SCADA system. A recycle water high flow alarm (>10% of FIT-212 flow, operator selectable set point) shall be reported in the SCADA system. A no flow (via FIT-813) reading for 90 seconds (operator selectable) shall shutdown the respective recycle water pump (P-800A and P-800B) and an alarm shall be reported in the SCADA system. Daily and total pump runtimes shall be logged in the SCADA system. Daily pump runtime shall reset at the start of each day. The total daily recycle water production shall be calculated as the sum of the daily production for each recycle pump and shall be reported in gallons. The daily recycle water totalizers shall reset at 12:00 AM each day.

Pressure transmitters shall be provided on the recycle pump discharge piping (PIT-817A, PIT-817B). Pressure transmitters measure, locally indicate, and transmit pressure both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high and high-high discharge pressure. The alarm set points shall be operator selectable. The recycle pumps (P-800A, P-800B) shall be de-energized by the SCADA system for high-high discharge pressure (via PIT-817A, PIT-817B, respectively).

The recycle pumps shall turn on and shut off based on the “Online” BWWT compartment level, measured via the level indicating transmitters (LIT-811A, LIT-811B, LIT-811C). Alarms shall be reported in the SCADA system for low and high backwash waste tank compartment levels.

Backwash Waste Tank Operating Elevations		
Description	Elevation (feet NAVD88)	Water Depth (feet)
Overflow Elevation (LSH-815A, LSH-815B, LSH-815C)	223.5	9.3
High Level Alarm (via LIT-811A, LIT-811B, LIT-811C)	223.0	8.8
Backwash Max Level (via LIT-811A, LIT-811B, LIT-811C)	221.4	7.2
Recycle Pump Start (via LIT-811A, LIT-811B, LIT-811C)	217.7	3.5
Recycle Pump Stop (via LIT-811A, LIT-811B, LIT-811C)	216.2	2.0
Low Level Alarm (via LIT-811A, LIT-811B, LIT-811C)	215.7	1.5
Minimum Water Level (via LSL-816A, LSL-816B, LSL-816C)	215.2	1.0

### Sludge Pumps

Two end suction centrifugal pumps (P-801A, P-801B) shall pump settled backwash solids from the backwash waste tank to a truck connection for disposal. The operator shall energize the sludge pump (P-801A, P-801B) with a HAND/OFF selector switch (HS-801A, HS-801B) on the sludge pump field control panel (SP-FCP) located on the WTP exterior. When the HAND/OFF switch is turned clockwise, the sludge pumps shall energize. Once the switch is released and automatically returns to the OFF position the sludge pump de-energizes. The sludge pump run statuses shall be displayed at the SP-FCP, at the MCP OIT, and in the SCADA system. The level indicators (LI-811A, LI-811B, LI-811C) in the SP-FCP display the sludge level in the respective backwash waste tanks, measured via LE-811A, LE-811B, LE-811C. Sludge pump fault and high temperature (via motor controller) alarms shall be reported in the SCADA system and indicated at the SP-FCP. There shall be no SCADA remote control of the sludge pumps

A flow meters shall be provided on the sludge pump discharge piping (FIT-814). The flow meter shall measure, locally indicate, and transmit flow both to the site-local SCADA/control panel and in the SCADA system. Alarm conditions shall be reported in the SCADA system for high flow. The high flow alarm set point shall be operator selectable.

## R. Sodium Hypochlorite Chemical Feed

### Bulk Tank

Sodium hypochlorite (NaOCl) is added for chemical oxidation and disinfection. NaOCl shall be stored in a 905 gallon bulk storage tank (BT-400), which shall be equipped with a high-high level switch (LSH-412) and an ultrasonic level transmitter (LIT-411) to monitor liquid level in the tank. A high-high bulk tank level alarm (via LSH-412) shall be reported in the SCADA system, which shall activate a strobe and horn on the NaOCl bulk chemical fill panel (BCFP; located on the building exterior) to prevent overflow and spills. The bulk tank level (via LIT-411) is displayed at the MCP OIT, in the SCADA system, and at the bulk chemical fill panel (via LI-421). An emergency indication pushbutton (PB-422) shall be located on the NaOCl BCFP. When depressed a chemical fill emergency alarm (acknowledged via PB-422A) shall be reported in the SCADA system. Alarm conditions shall be reported in the SCADA system for high,

low, and low-low level in the bulk tank. The alarm set points shall be operator selectable.

### Transfer Pump

Sodium hypochlorite is pumped from the bulk storage tank to the pre- and post-filtration NaOCl day tanks (DT-401 and DT-402) via dedicated transfer pumps (pre-filtration: TP-403, post-filtration: TP-406).

The operator shall energize the transfer pump (TP-403, TP-406) with a local ON/OFF selector switch (pre-filtration: HS-414, post-filtration: HS-417). When the transfer pump selector switch is turned clockwise, the transfer pump shall energize. Once the switch is released and automatically returns to the OFF position the transfer pump de-energize. There shall be no SCADA remote control of the chemical transfer pumps. A high day level via tank level switch (pre-filtration: LSH-413, post-filtration: LSH-416) shall de-energize the respective transfer pump (pre-filtration: TP-403, post-filtration: TP-406) via run permissive from the SCADA system.

### Day Tank

Sodium hypochlorite is stored in a 70-gallon day tank (pre-filtration oxidation) (DT-401) and a 30-gallon day tank (post-filtration disinfection/residual) (DT-402). The day tanks are equipped with a high level switches (pre-filtration: LSH-413, post-filtration: LSH-416) to monitor liquid level in the tank. A high day tank level alarm (via LSH-413, LSH-416) shall be reported in the SCADA system.

### Pre-Filtration Chemical Feed Pumps

Pre-filtration NaOCl feed shall be paced based on the treatment plant water flow rate as measured by the Wells 2 & 3 raw and recycle flow meter (FIT-212). The pre-filtration NaOCl chemical feed pumps (duty: MP-404, standby: MP-405) draw the chemical from the 70-gallon day tank and pump it to the injection point. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the pre-filtration pump shall be selected by an H-O-A selector switch (duty: HS-404A, standby: HS-405A) located on the pre-filtration NaOCl Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the Wells 2 & 3 raw and recycle flow meter (FIT-212) shall shut down the pre-filtration chemical feed pump (MP-404, MP-405).

Hand-Off-Auto controls for the metering pumps shall be located at the pre-filtration NaOCl Metering Pump Control Panels in the NaOCl storage area as selector switches (duty: HS-404A, standby: HS-405A). When the metering pump is in "AUTO" mode, it is controlled and operated via the SCADA system. There are two operator selectable "AUTO" modes: SCADA-ChemicalSetPoint and SCADA-FlowRatio. For SCADA-ChemicalSetPoint, the operator shall enter the desired chemical dosage and the SCADA system shall vary the speed of the metering pump based on chemical pump

characteristics (operator selectable), chemical characteristics (operator selectable), and measured Wells 2 & 3 raw and recycle flow meter (FIT-212) for pre-filtration NaOCl feed. For SCADA-FlowRatio, the operator shall enter the desired ratio of chemical to flow and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured Wells 2 & 3 raw and recycle flow meter (FIT-212) for pre-filtration NaOCl feed. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panels. Selection of “HAND” can only be performed at the Metering Pump Control Panel via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

#### Post-Filtration Chemical Feed Pumps

Post-filtration NaOCl feed shall be paced based on the treatment plant water flow rate as measured by the filtered water flow meter (FIT-312). The post-filtration NaOCl chemical feed pumps (duty: MP-407, standby: MP-408) draw the chemical from the 30-gallon day tank and pump it to the injection point. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the post-filtration pump shall be selected by an H-O-A selector switch for disinfection (duty: HS-407A, standby: HS-408A) located on the post-filtration NaOCl Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition calculated as measured by the filtered water flow meter (FIT-312) shall shut down the post-filtration chemical feed pump (MP-407, MP-408). A no-flow condition at the filtered water flow meter (FIT-312) shall shut down the post-filtration chemical feed pump (MP-407, MP-408). A no-flow condition at the filtered water flow meter (FIT-312) shall shut down the post-filtration chemical feed pump (MP-407, MP-408).

Hand-Off-Auto controls for the metering pumps shall be located at the post-filtration NaOCl Metering Pump Control Panels in the NaOCl storage area as selector switches (duty: HS-407A, standby: HS-408A). When the metering pump is in “AUTO” mode, it is controlled and operated via the SCADA system. There are two operator selectable “AUTO” modes: SCADA-ChemicalSetPoint and SCADA-FlowRatio. For SCADA-ChemicalSetPoint, the operator shall enter the desired chemical dosage and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the filtered water flow meter for post-filtration NaOCl feed (FIT-312). For SCADA-FlowRatio, the operator shall enter the desired ratio of chemical to flow and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the filtered water flow meter (FIT-312) for post-

filtration NaOCl feed. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of “HAND” can only be performed at the Metering Pump Control Panels via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

#### S. Potassium Hydroxide Chemical Feed

##### Bulk Tank

Potassium Hydroxide (KOH) is added for pH adjustment. KOH shall be stored in a 3,000 gallon bulk storage tank (BT-500), which shall be equipped with a high-high level switch (LSH-512) and an ultrasonic level transmitter (LIT-511) to monitor liquid level in the tank. A high-high bulk tank level alarm (via LSH-512) shall be reported in the SCADA system, which shall activate a strobe and horn on the KOH BCFP (located on the building exterior) to prevent overflow and spills. The bulk tank level (via LIT-511) is displayed at the MCP OIT, in the SCADA system, and at the bulk chemical fill panel (via LI-511). An emergency indication pushbutton (PB-517) shall be located on the KOH BCFP. When depressed, a chemical fill emergency alarm (acknowledged via PB-517A) shall be reported in the SCADA system. Alarm conditions shall be reported in the SCADA system for high, low, and low-low level via LIT-511 and high-high level via LSH-512 in the bulk tank. The alarm set points shall be operator selectable.

##### Transfer Pump

Potassium Hydroxide is pumped from the bulk storage tank to the 230-gallon KOH day tank (DT-501) via dedicated transfer pump (TP-502).

The operator shall energize the transfer pump (TP-502) with an ON/OFF selector switch (HS-514). When the transfer pump selector switch is turned clockwise, the transfer pump shall energize. Once the switch is released and automatically returns to the OFF position the transfer pump shall de-energize. There shall be no SCADA remote control of the chemical transfer pump. A high day level via tank level switch (pre-filtration: LSH-513) shall de-energize the transfer pump (TP-502) via run permissive from the SCADA system.

##### Day Tank

Potassium Hydroxide is stored in a 230-gallon day tank (DT-501) for chemical addition. The day tank is equipped with a high level switch (LSH-513) to monitor liquid level in the tank. A high day tank level alarm (via LSH-513) shall be reported in the SCADA system.

## Chemical Feed Metering Pumps

KOH feed shall be paced based on the Wells 2, 3, and 4 combined flow rate as measured by the PFAS Treatment Influent flow meter (FIT-311). The KOH chemical feed metering pumps (duty: MP-503, standby: MP-504) draw the chemical from the 230-gallon day tank and pump it to the injection point. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the metering pump shall be selected by an H-O-A selector switch for pH control (duty: HS-503A, standby: HS-504A) located on the KOH Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the PFAS Treatment Influent flow meter (FIT-311) shall shut down the chemical feed metering pumps (MP-503, MP-504).

H-O-A controls for the metering pumps shall be located at the KOH Metering Pump Control Panels in the KOH containment area as selector switches (duty: HS-503A, standby: HS-504A). When the metering pump is in "AUTO" mode, it is controlled and operated via the SCADA system. There are two operator selectable "AUTO" modes: SCADA-ChemicalSetPoint and SCADA-FlowRatio. For SCADA-ChemicalSetPoint, the operator shall enter the desired chemical dosage and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the PFAS Treatment Influent flow meter (FIT-311) for feed. For SCADA-FlowRatio, the operator shall enter the desired ratio of chemical to flow and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the PFAS Treatment Influent flow meter (FIT-311) for KOH feed. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select "HAND" position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. "Pump in Hand" shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of "HAND" can only be performed at the KOH Metering Pump Control Panel via the selector switch, and "HAND" operation of the metering pumps cannot be completed in the SCADA system. In the "OFF" position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

### T. Sodium Bisulfite Chemical Feed

#### Bulk Tank

Sodium bisulfite ( $\text{NaHSO}_3$ ) is added for dechlorination. Sodium bisulfite shall be stored in a 1,150 gallon bulk storage tank (BT-600), which shall be equipped with a high-high level switch (LSH-612) and an ultrasonic level transmitter (LIT-611) to monitor liquid level in the tank. A high-high bulk tank level alarm (via LSH-612) shall be reported in the SCADA system, which shall activate a strobe and horn on the sodium

bisulfite BCFP (located on the building exterior) to prevent overflow and spills. The bulk tank level (via LIT-611) is displayed at the MCP OIT, in the SCADA system, and at the bulk chemical fill panel (via LI-611). An emergency indication pushbutton (PB-612) shall be located on the sodium bisulfite BCFP. When depressed, a chemical fill emergency alarm (acknowledged via PB-612A) shall be reported in the SCADA system. Alarm conditions shall be reported in the SCADA system for high, low, and low-low level via LIT-611 and high-high level via LSH-612 in the bulk tank. The alarm set points shall be operator selectable.

### Transfer Pump

Sodium bisulfite is pumped from the bulk storage tank to the sodium bisulfite day tank (DT-601) via dedicated transfer pump (TP-602). A high day tank level alarm via the tank level switch (LSH-613) shall turn off the transfer pump (TP-602) via the SCADA system.

The operator shall energize the transfer pump (TP-602) with an ON/OFF selector switch (HS-615). When the transfer pump selector switch is turned clockwise, the transfer pump shall energize. Once the switch is released and automatically returns to the OFF position the transfer pump shall de-energize. There shall be no SCADA remote control of the chemical transfer pump. A high day level via tank level switch (LSH-613) shall de-energize the transfer pump (TP-602) via run permissive from the SCADA system.

### Day Tank

Sodium bisulfite is stored in a 30-gallon day tank (DT-601) for chemical addition. The day tank is equipped with a high level switch (LSH-613) to monitor liquid level in the tank. A high day tank level alarm (via LSH-613) shall be reported in the SCADA system.

### Chemical Feed Metering Pumps

Sodium bisulfite feed shall be paced based on the Fe/Mn filter effluent flow rate (via FIT-218). The sodium bisulfite chemical feed metering pumps (duty: MP-603, standby: MP-604) draw the chemical from the 30-gallon day tank and pump it to the injection point. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the metering pump shall be selected by an H-O-A selector switch for pH control (duty: HS-603A, standby: HS-604A) located on the sodium bisulfite Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the Fe/Mn filter effluent flow meter (FIT-218) shall shut down the chemical feed metering pumps (MP-603, MP-604).

H-O-A controls for the metering pumps shall be located at the sodium bisulfite Metering Pump Control Panels in the sodium bisulfite containment area as selector switches (duty: HS-603A, standby: HS-604A). When the metering pump is in

“AUTO” mode, it is controlled and operated via the SCADA system. There are two operator selectable “AUTO” modes: SCADA-ChemicalSetPoint and SCADA-FlowRatio. For SCADA-ChemicalSetPoint, the operator shall enter the desired chemical dosage and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the Fe/Mn filter effluent flow meter (FIT-218) for feed. For SCADA-FlowRatio, the operator shall enter the desired ratio of chemical to flow and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the Fe/Mn filter effluent flow meter (FIT-218) for sodium bisulfite feed. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of “HAND” can only be performed at the KOH Metering Pump Control Panel via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system

#### U. Sodium Fluoride Chemical Feed

##### Saturator and Overflow Assembly

Sodium Fluoride (NaF) is added for fluoridation. The chemical solution is prepared on a continuous basis by potable water flowing through a bed of fluoride and dissolving the fluoride to saturation concentration within a fluoride saturator. The fluoride bed is maintained within a manufacturer specified thickness range by the operator adding dry NaF to the saturator based on visual inspection of the fluoride bed thickness.

NAF shall be stored in a 55-gallon saturator tank (SAT-650) and shall include an overflow assembly. The saturator and overflow assembly shall be provided with a solenoid valve (SV-680), float switch (LSH-652), and mechanical float shutoff valve to facilitate automatic operation of the fluoride saturator. The float switch (LSH-652) shall be located within the saturator and shall be connected to the solenoid valve (SV-680), which controls potable water flow into the saturator.

Flow into the saturator is initiated when the tank level drops and the float switch signals for the solenoid valve to open. Flow into the saturator shall continue until the float switch returns to the manufacturer-specified level, at which point the float switch shall signal for the solenoid valve to close. A disc water meter indicates the process water flow rate locally.

The mechanical float shutoff valve shall be located within the overflow tank and act as a mechanical water shutoff. The mechanical float shutoff valve shall be located on the potable water line between the solenoid valve and the outlet to the saturator.

In the event of solenoid failure and the valve is stuck open, the saturator shall overflow to the overflow tank and fill until the float component of the mechanical float shutoff valve rises high enough to close the ball valve component of the mechanical float shutoff valve.

#### Chemical Feed Metering Pumps

NAF feed shall be paced based on the treatment plant water flow rate as measured by the filtered water flow meter (FIT-312). The NAF chemical feed metering pump (MP-651) draws the chemical from the 55-gallon saturator tank and pumps it to the injection point. The chemical feed pump is equipped with integral mode start/stop controls. Automatic or Manual control of the metering pump shall be selected by an H-O-A selector switch (HS-651A) located on the NAF Metering Pump Control Panel. The pump can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panel H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the filtered water flow meter (FIT-312) shall shut down the chemical feed metering pump (MP-651).

H-O-A controls for the metering pump shall be located at the NAF Metering Pump Control Panel in the NAF containment area as a selector switch (HS-651A). When the metering pump is in "AUTO" mode, it is controlled and operated via the SCADA system. There are two operator selectable "AUTO" modes: SCADA-ChemicalSetPoint and SCADA-FlowRatio. For SCADA-ChemicalSetPoint, the operator shall enter the desired chemical dosage and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the filtered water flow meter (FIT-312) for feed. For SCADA-FlowRatio, the operator shall enter the desired ratio of chemical to flow and the SCADA system shall vary the speed of the metering pump based on chemical pump characteristics (operator selectable), chemical characteristics (operator selectable), and measured flow by the filtered water flow meter (FIT-312) for NAF feed. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select "HAND" position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. "Pump in Hand" shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of "HAND" can only be performed at the NAF Metering Pump Control Panel via the selector switch, and "HAND" operation of the metering pump cannot be completed in the SCADA system. In the "OFF" position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system

#### V. Analyzers:

##### Wells 2&3 Raw & Recycle Water

A combined pH and temperature analyzer (AIT-961) shall measure pH and temperature of the Wells 2 & 3 raw & recycle water. High and low pH alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable.

### Oxidized Water

A combined chlorine residual, pH, and temperature analyzer (AIT-962) shall measure chlorine residual, pH, and temperature of the oxidized water. High, high-high, low, and low-low chlorine residual alarm conditions shall be reported in the SCADA system. High and low pH alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. In the event of a high-high or low-low oxidized chlorine residual, the SCADA system shall de-energize the Well 2 Pumps (P-100A &P-100B) and Well 3 Pump (P-141).

### Fe/Mn Filtered Water

A combined chlorine residual, pH, and temperature analyzer (AIT-963) shall measure chlorine residual, pH, and temperature of the Fe/Mn filtered water. High and low pH and chlorine alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable.

### PFAS Filter Influent Water

A combined chlorine residual, pH, and temperature analyzer (AIT-964) shall measure chlorine residual, pH, and temperature of the PFAS influent water. Alarm conditions for pH and chlorine shall be reported in the SCADA system. Low-low or high-high pH alarm conditions (operator selectable setpoint) shall turn off Well 2 Pumps (P-100A &P-100B), Well 3 Pump (P-141) and Well 4 Pump (P-171), and an alarm shall be reported in the SCADA system. A high-high chlorine alarm condition (operator selectable setpoint) shall turn-off Well 2 Pumps (P-100A & P-100B) and Well 3 Pump (P-141), and alarm shall be reported in the SCADA system. The alarm set points shall be operator selectable.

### Finished Water

A combined chlorine residual, pH, and temperature analyzer (AIT-965) shall measure chlorine residual, pH, and temperature of the finished water. Alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. Low-low or high-high finished water pH shall turn-off Well 2 Pumps (P-100A &P-100B), Well 3 Pump (P-141), Well 4 Pump (P-171) and Finished Water Pumps (P-700A, P-700B, P-700C), and an alarm shall be reported in the SCADA system. Low-low or high-high finished water chlorine reading shall turn off Well 2 Pumps (P-100A &P-100B), Well 3 Pump (P-141), Well 4 Pump (P-171) and Finished Water Pumps (P-700A, P-700B, P-700C), and an alarm shall be reported in the SCADA system.

### Finished Water (100-ft Sample Tap)

A combined chlorine residual, pH, and temperature analyzer (AIT-966) shall be used to measure chlorine residual, pH, and temperature of the 100-ft sample tap water. Alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. Low-low or high-high 100-ft sample tap water pH shall turn off Well 2 Pumps (P-100A & P-100B), Well 3 Pump (P-141), Well 4 Pump (P-171) and Finished Water Pumps (P-700A, P-700B, P-700C), and an alarm shall be reported in

the SCADA system. Low-low or high-high 100-ft sample tap water chlorine reading shall turn off Well 2 Pumps (P-100A &P-100B), Well 3 Pump (P-141), Well 4 Pump (P-171), and Finished Water Pumps (P-700A, P-700B, P-700C), and an alarm shall be reported in the SCADA system.

#### Sample Line Solenoid Valves

The normally closed sample line solenoid valves (SV-967A, SV-967B, SV-967C, SV-967D, SV-967E, SV-967F) shall be energized to open when the Well Pumps (Well 2: P-100A &P-100B; Well 3: P-141; Well 4: P-171) or Finished Water Pumps (P-700A, P-700B, P-700C) are called to run. The sample lines solenoid valves shall remain open during WTP operation.

#### W. Flood Alarms:

Flood switches shall be provided at each of the well stations (LSH-113, LSH-151, LSH-181). Flood level switches shall be provided in the WTP potassium hydroxide/sodium hypochlorite chemical room 105 (LSH-419), sodium bisulfite chemical room 104 (LSH-614), and Pipe Gallery (LSH-996). An area-specific flood alarm shall be reported in the SCADA system when a level switch is activated.

#### X. Room/Area Temperature

##### Well Station 2, 3, and 4

Temperature transmitters shall be provided at the Well Stations and will measure the room temperature for Well Stations 2, 3, and 4 (TT-112, TT-150, TT-180). The temperature shall be displayed at the respective well station OIT, WTP MCP OIT, and in the SCADA system. Alarm conditions shall be reported to the SCADA system for high and low temperature. The alarm set points shall be operator selectable.

##### Nitrate Removal Area (Room 101)

TT-921 measures the Nitrate Removal Area temperature, and the temperature reading shall be displayed at the WTP MCP OIT and in the SCADA system. Alarm conditions shall be reported to the SCADA system for high and low temperature. The alarm set points shall be operator selectable.

##### Fe/Mn Removal Area Area (Room 103)

TT-923 measures the temperature of the Fe/Mn Removal Area, and the temperature reading shall be displayed at the WTP MCP OIT and in the SCADA system. Alarm conditions shall be reported to the SCADA system for high and low temperature. The alarm set points shall be operator selectable.

##### Control Room (Room 106)

TT-926 measures the WTP Control Room temperature, and the temperature reading shall be displayed at the WTP MCP OIT and in the SCADA system. Alarm conditions

shall be reported to the SCADA system for high and low temperature. The alarm set points shall be operator selectable.

#### Electrical Room (Room 111)

TT-930 measures the Electrical Room temperature, and the temperature reading shall be displayed at the MCP OIT and in the SCADA system. Alarm conditions shall be reported to the SCADA system for high and low temperature. The alarm set points shall be operator selectable.

#### Y. HVAC

High humidity alarms from the dehumidifier units (DHU-1 and DHU-2) shall be reported in the SCADA system.

#### Z. Emergency Shower Flow Switches

FS-420 and FS-421 are emergency shower flow switches located in the KOH & NaOCl Chemical Room. Activation of the flow switches shall be reported in the SCADA system.

#### AA. Intrusion:

An intrusion condition shall be reported as a security alarm in the SCADA system at Well Stations 2, 3, and 4 and the WTP. The security alarm shall be reported via the local Security Access Control Panel.

#### BB. Fire:

A fire condition at the WTP shall be reported as an alarm in the SCADA system. A supervisory alarm shall be reported in the SCADA system. All alarms shall be reported via the Fire Alarm Control Panel.

#### CC. Generator:

In the event of a power failure at the WTP, the stand-by generator shall start. Generator alarms for run status and generator fault shall be reported in the SCADA system. Generator mode verifying if the generator is in auto mode shall be reported in the SCADA system.

#### DD. Automatic Transfer Switch

In the event of a power failure at the WTP or Well Station, the automatic transfer switch (ATS) shall automatically switch to generator power supply. The ATS position (normal, emergency) shall be reported in the SCADA system. An alarm signal shall be sent to SCADA for loss of utility power.

#### EE. Tight Tank

The tight tank shall be equipped with a high level switch (LSH-971) and a high-high level switch (LSH-972) to monitor the liquid level in the tank. The high and high-high level alarms (via LSH-971 and LSH-972) shall be reported in the SCADA system.

#### FF. Chemical Alarm

A chemical alarm condition shall be reported as an alarm in the SCADA system. The chemical alarm shall be reported via the Chemical Alarm Control Panel.

#### GG. Personnel Down Switch

A personnel down switch shall be provided at Well Station 2 (PB-111), Well Station 3 (PB-149), Well Station 4 (PB-179), WTP Nitrate Removal Area (PB-981), PFAS Removal Area (PB-982), Fe/Mn Removal Area (PB-983), Sodium Bisulfite Chemical Room (PB-984), Potassium Hydroxide and Sodium Hypochlorite Chemical Room (PB-985), Control Room (PB-986), Pipe Gallery Room 001 West (PB-991), and Pipe Gallery Room 001 East (PB-992). When activated, a personnel down alarm shall be reported in the SCADA system.

#### HH. Emergency Stop

An emergency E-STOP push button shall be provided on each well station control panel (Well 2: PB-117, Well 3: PB-152, Well 4: PB-183). When activated, the respective well pumps (Well 2: P-100A & P-100B; Well 3: P-141; Well 4: P-171) shall de-energize and an alarm shall be reported in the SCADA system. When activated, the WTP MCP Emergency Stop switches on the Main Control Panel (PB-993) and in the Fe/Mn Filter Area (PB-994) shall turn off the Well Pumps (P-100A & P-100B, P-141, P-171), Finished Water Pumps (P-700A, P-700B, P-700C), Recycle Pumps (P-800A, P-800B), Pre-Filtration NaOCl Metering Pumps (MP-404, MP-405), Post-Filtration NaOCl Metering Pumps (MP-407, MP-408), KOH Metering Pumps (MP-503, MP-504), NaHSO<sub>3</sub> Metering Pumps (MP-603, MP-604), NaF Metering Pumps (MP-651), and the Air Scour Blower (ASB-202).

#### II. Interlocks:

Refer to I-2 of the Contract Drawings and other Sections of Division 13 – Special Construction for equipment interlocks. Remote resetting of interlock conditions shall not be permitted.

Any WTP equipment de-energized by an interlock shall be reset at the WTP MCP.

Any well station equipment de-energized by an interlock shall be reset at the respective well station control panel.

#### JJ. Alarms: Refer to Specification Section 13400 for a summary of alarms.

END OF SECTION 13465

DIVISION 14 – HOISTING EQUIPMENT

14300 .....Hoisting Equipment

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

## SECTION 14300

### HOISTING EQUIPMENT

#### PART 1 – GENERAL

##### 1.1 DESCRIPTION

- A. Provide and test hoisting equipment, gear reducers, controls and appurtenances as indicated and in compliance with Contract Documents.
  - 1. Rail and supporting beams included in building structure, refer to structural drawings.
  - 2. Hoist capacities and operating data are indicated herin.

##### 1.2 REFERENCES

- A. American Bearing Manufacturers Association (ABMA):
  - 1. 9: Load Ratings and Fatigue Life for Ball Bearings.
  - 2. 11: Load Ratings and Fatigue Life for Roller Bearings.
- B. American Welding Society (AWS):
  - 1. D1.1: Structural Welding Code Aluminum.
- C. National Electric Code (NEC).
- D. National Electrical Manufacturers Association (NEMA):
  - 1. MG1: Motors and Generators.
- E. Occupational Safety and Hazard Association (OSHA):
  - 1. 29 CFR 1910.179: Overhead and Gantry Cranes.

##### 1.3 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01300:
  - 1. Data regarding hoisting equipment characteristics and performance:
  - 2. Certified setting plans, with tolerances, for anchor bolts.
  - 3. Manufacturer's literature as needed to supplement certified data.
  - 4. Operating and maintenance instructions and parts lists.
  - 5. Listing reference installations as specified with contact names and telephone numbers.
  - 6. List of recommended spare parts other than those specified.
  - 7. Shop and field inspection reports.
  - 8. Motor shop test results.
  - 9. Qualifications of field service engineer.
  - 10. Recommendations for short and long-term storage.
  - 11. Shop and field testing procedures, equipment to be used.
  - 12. Special tools.
  - 13. Number of service person-days provided and per diem field service rate.
  - 14. Manufacturer's product data, specifications and color charts for shop painting.
  - 15. The latest ISO 9001 series certification.

16. Provide scaled drawing height and weight of equipment serviced by the hoisting equipment including hook height and travel dimensions.

17. Material Certification:

- i. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
  - ii. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
- B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
- C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
  2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

#### 1.4 SPARE PARTS

- A. Comply with the requirements specified in Section .
- B. Provide spare parts that are identical to and interchangeable with similar parts installed.

#### 1.5 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section .
- B. Permanently mark the capacity of the hoist and trolley on each hoist, in easy to read letters and in a prominent position.
- C. Provide only safety type hooks.
- D. Provide hoists so that hook can reach the floor at the lowest level of the lift.
- E. Do not use hoists for construction purposes of any nature.
- F. Hoists shall be manufacturer's standard cataloged product and modified to provide compliance

with the drawings, specifications and the service conditions specified and indicated.

- G. Welding: In accordance with American Welding Society Code D1.1.
- H. Provide shop tests as specified.
- I. Hoisting equipment manufacturer shall provide hoists, motors, gear reducers, switches, and controls regardless of manufacturer as a complete integrated package to ensure coordination, compatibility, and operation of the systems.
- J. Services of Manufacturer's Representative as stated in Section and as specified herein.
- K. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
  - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
  - 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping and electrical:
    - i. 1 person-days.
  - 3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.
    - i. 1 person-days.
  - 4. Performance Testing: Field performance test equipment specified.
    - i. 1 person-days.
  - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
    - i. 1 person-days.
  - 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
  - 7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
- L. Manufacturer of hoisting equipment shall have a minimum of five (5) operating installations with hoists of the size specified and in the same service as specified operating for not less than five (5) years.

#### 1.6 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01610 – Delivery, Storage, and Handling and as specified herein. Ship equipment and material complete except where partial disassembly is required by transportation regulations or for protection of components.
- B. Store products in manufacturer's packaging or until ready for installation/furnishing to Owner.
- C. Equipment shall not be used by Contractor to complete work required by this Contract.

## PART 2 - PRODUCTS

### 2.1 SYSTEM DESCRIPTION

- A. Hoisting equipment capacities and operating data are indicated in the Hoist Schedule.

### 2.2 CRANE HOISTS

- A. Hoist Mechanism: Fully enclosed high-speed, spur-gearred, ball or roller bearing, hand-operated, chain hoist with a retaining brake or other acceptable device built into hoisting mechanism.
- B. Hooks: High grade, forged steel with swivel, antifriction bearings.
- C. Load Wheel: Make with accurately formed chain pockets to fit load chain.
- D. Hoist Operating Wheel: A load limiting clutch mechanism consisting of spring loaded rollers that run between an outer race and an inner hub mounted on the outside of the wheel. The clutch shall be designed to limit the chain pull to not more than 150 percent of that required to lift the rated load capacity of the hoist. Provide with chain guides with chain of sufficient length to hang 3 feet (0.9 meters) above operating floor.
- E. Chain Bucket: Provide where specified to collect load chain. Arrange chain bucket so it will not interfere with smooth operation of hoist.
- F. Lightweight Hoists: Make with high strength aluminum frame, hand wheel and housing.
- G. Provide each hoist with a clevis connection for use with a trolley, a suspension hook at top, or be integrally built into trolley as indicated on drawings or specified herein.
- H. Hoist Capacity: 1/2 ton
- I. Trolley shall mount to W12x50 hoist beam. Refer to Structural Drawings for hoist beam details.
- J. Manufacturers
  - 1. Harrington.
  - 2. ACCO-Wright.
  - 3. Engineer-Approved Equal

### 2.3 ELECTRIC SCISSOR LIFT

- A. Platform Height: 26 feet
- B. Working Height: 32 feet
- C. Platform Capacity: 1200 lb
- D. Machine Width: 3 ft 10 in
- E. Brakes: Electric, friction
- F. Maximum Ground Bearing Pressure: 137 psi
- G. Drive Speed:
  - 1. Platform Elevated: 3 mph
  - 2. Platform Lowered: 0.5 mph
- H. Power Source:
  - 1. Battery powered: (4) 6V, 220 A-h
  - 2. Charger: automatic, 27 amp

- I. Lift Time: 62 sec
- J. Lower Time: 37 sec
- K. Turning Radius:
  - 1. Inside: 0 ft
  - 2. Outside: 7 ft 4 in
- L. Manufacturers
  - 1. JLG Model ES2646
  - 2. Engineer-Approved Equal

## 2.4 PORTABLE GANTRY

- A. Portable Gantry: Four-leg rolling-type gantry with 1 ton capacity. Horizontal standard aluminum beam suspended at each end by pipe legs adjustable for both height and span at floor, adequately braced, with locking swivel casters for each leg.
- B. Position legs and span by pins provided with springs and a locking device to fit matching holes in telescoping pipe members.
- C. Fit casters with ball bearings and wheels of rubber plastic treads designed for rated capacity of gantry.
- D. Provide stops at ends of beam to prevent trolley rolloff.
- E. Manufacturers
  - 1. RAZE Model RZAG-1
  - 2. Engineer-Approved Equal

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.
- B. Check horizontal and vertical alignment of track and rails.
- C. Erect rack level throughout, with section ends machined fitted and spliced with web-type couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.
- D. Do not use cast fittings.

### 3.2 FIELD TESTING

- A. Provide as specified herein. Perform all tests with instrumentation controls and motor controls. Perform testing in accordance with OSHA 29 CFR 1910.179 and as specified herein.
- B. Make all adjustments to place equipment in specified working order at time of above tests.
- C. After three (3) unsuccessful testing attempts, remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated.

### 3.3 FIELD TOUCH-UP PAINTING

- A. After installation and testing, apply touch-up paint to all scratched, abraded, and damaged shop painted surfaces. Coating type and color shall match shop painting.

### 3.4 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout.

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

SECTION 15001

PLUMBING

(Filed Sub-Bid Required)

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS all Sections within DIVISION 1 - GENERAL REQUIREMENTS, which are hereby made a part of this Section of the Specifications.

B. Time, Manner and Requirements for Submitting Sub-Bids:

1. Sub-Bids for work under this Section shall be for the complete work and shall be filed electronically on ProjectDog as stipulated in the Invitation to Bid.

The following shall be included in the electronic file name of the Sub-Bid:

NAME OF SUB-BIDDER: (Insert name of sub-bidder)

PROJECT: (Insert project name and number)

SUB-BID FOR SECTION: 15001 – PLUMBING

2. Each Sub-Bid submitted for work under this Section shall be on forms furnished as required by Section 44F of Chapter 149 or the Massachusetts General Law, as amended.

3. Sub-Bidders shall submit a BID BOND or CASH or CERTIFIED CHECK or a TREASURER'S or CASHIER'S CHECK issued by a responsible bank or trust company payable to the Awarding Authority in the amount of five percent (5%) of the Bid. Bid Securities shall be submitted in accordance with the Instructions to Bidders.

C. Sub-Sub-Bid Requirements: None required under this Section.

D. Reference Drawings: Work of this Filed Sub-Bid is shown in part or in full on the following Contract Drawings: G-1, G-2, C-6, C-7, CD-11, A-5, A-6, A-12, S-4, S-5, S-6, P-1, P-2, P-3, P-4, P-5, P-6, P-7, P-8, and P-9.

E. Work Included: Provide labor, materials and equipment to complete the work this Section, including but not limited to the following:

1. All work of: Section 15001 – Plumbing and Section 15400 – Plumbing.

F. Related Sections: The Sub-Bidder is directed to the following Specification Sections for determination and description of the full character and extent of the work to be included in this filed sub-bid:

1. Division 1 – General Requirements
  2. Division 2 – Site Work
- G. Alternates: Not Applicable.

END OF SECTION 15001

SECTION 15002

HEATING, VENTILATION, AND AIR CONDITIONING (HVAC)  
(Filed Sub-Bid Required)

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS all Sections within DIVISION 1 - GENERAL REQUIREMENTS, which are hereby made a part of this Section of the Specifications.

B. Time, Manner and Requirements for Submitting Sub-Bids:

1. Sub-Bids for work under this Section shall be for the complete work and shall be filed electronically on ProjectDog as stipulated in the Invitation to Bid.

The following shall be included in the electronic file name of the Sub-Bid:

NAME OF SUB-BIDDER: (Insert name of sub-bidder)

PROJECT: (Insert project name and number)

SUB-BID FOR SECTION: 15002 – HEATING, VENTILATION, AND AIR CONDITIONING (HVAC)

2. Each Sub-Bid submitted for work under this Section shall be on forms furnished as required by Section 44F of Chapter 149 or the Massachusetts General Law, as amended.

3. Sub-Bidders shall submit a BID BOND or CASH or CERTIFIED CHECK or a TREASURER'S or CASHIER'S CHECK issued by a responsible bank or trust company payable to the Awarding Authority in the amount of five percent (5%) of the Bid. Bid Securities shall be submitted in accordance with the Instructions to Bidders.

C. Sub-Sub-Bid Requirements: None required under this Section.

D. Reference Drawings: Work of this Filed Sub-Bid is shown in part or in full on the following Contract Drawings: G-1, G-2, C-6, A-5, A-6, A-7, A-8, A-9, A-10, A-11, A-12, A-13, A-14, A-21, H-1, H-2, H-3, H-4, H-5, H-6, H-7, H-8, H-9, H-10, H-11, and H-12.

E. Work Included: Provide labor, materials and equipment to complete the work this Section, including but not limited to the following:

1. All work of: Section 15002 – Heating, Ventilation, and Air Conditioning (HVAC), Section 15500 – Heating, Ventilation, and Air Conditioning (HVAC), and Section 15900 – Laboratory Fume Hoods.

- F. Related Sections: The Sub-Bidder is directed to the following Specification Sections for determination and description of the full character and extent of the work to be included in this filed sub-bid:
1. Division 1 – General Requirements
  2. Division 10 – Specialties
- G. Alternates: Not Applicable.

END OF SECTION 15002

SECTION 15003

FIRE PROTECTION  
(Filed Sub-Bid Required)

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS all Sections within DIVISION 1 - GENERAL REQUIREMENTS, which are hereby made a part of this Section of the Specifications.

B. Time, Manner and Requirements for Submitting Sub-Bids:

1. Sub-Bids for work under this Section shall be for the complete work and shall be filed electronically on ProjectDog as stipulated in the Invitation to Bid.

The following shall be included in the electronic file name of the Sub-Bid:

NAME OF SUB-BIDDER: (Insert name of sub-bidder)

PROJECT: (Insert project name and number)

SUB-BID FOR SECTION: 15003 – FIRE PROTECTION

2. Each Sub-Bid submitted for work under this Section shall be on forms furnished as required by Section 44F of Chapter 149 or the Massachusetts General Law, as amended.

3. Sub-Bidders shall submit a BID BOND or CASH or CERTIFIED CHECK or a TREASURER'S or CASHIER'S CHECK issued by a responsible bank or trust company payable to the Awarding Authority in the amount of five percent (5%) of the Bid. Bid Securities shall be submitted in accordance with the Instructions to Bidders.

C. Sub-Sub-Bid Requirements: None required under this Section.

D. Reference Drawings: Work of this Filed Sub-Bid is shown in part or in full on the following Contract Drawings: G-1, G-2, A-1, A-2, A-5, A-6, A-12, FP-1, FP-2, FP-3, FP-4, FP-5, and FP-6.

E. Work Included: Provide labor, materials and equipment to complete the work this Section, including but not limited to the following:

1. All work of: Section 15003 – Fire Protection and Section 15300 – Fire Protection.

- F. Related Sections: The Sub-Bidder is directed to the following Specification Sections for determination and description of the full character and extent of the work to be included in this filed sub-bid:
1. Division 1 – General Requirements
- G. Alternates: Not Applicable.

END OF SECTION 15003

## SECTION 15300

### FIRE PROTECTION

(Part of Filed Sub-Bid Section 15003 – FIRE PROTECTION WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. Related Sections include the following:

- 1. Division 0 – Bidding and Contract Requirements
- 2. Division 1 – General Requirements

- B. Work included:

- 1. Design and provide new automatic wet pipe fire suppression sprinkler systems. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Contract Specifications, the Contract Drawings, and the codes and standards listed herein.
- 2. Coordinate with the Local Water Department as to any Local restrictions or requirements relative to backflow prevention devices and metering.
- 3. Hydrant flow test.
- 4. Wet pipe automatic sprinkler system for full fire protection coverage throughout as indicated. Systems shall be separated into the zones indicated on the Contract Drawings.

- C. Work not included:

- 1. Excavation and backfilling, including gravel or sand bedding for buried pipe is included under Division 2 - Site Work of these Specifications.
- 2. Concrete mounting bases is included under Division 3 – Cast-In-Place Concrete of these Specifications.
- 3. Painting of pipe, pipe hangers and supports is included under Division 9 – Painting of these Specifications.
- 4. Fire Alarm system wiring is included under Division 16 – Electrical of these Specifications.

### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of the Section 00700 - General Conditions And Section 01300 - Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Detail Drawings - Prepare 24 by 36 inch detail working drawings of sprinkler heads and piping system layout in accordance with NFPA 13, "Working Drawings." Show data essential for proper installation of each system. Show details, plan view, elevations, and sections of the systems supply and piping. Show piping schematic of systems supply, devices, valves, pipe, and fittings. Submit Working Drawings signed by the Fire Protection Engineer.
  - 2. Coordination Drawings - Prepare as specified in Paragraph "Cooperation and Coordination with Other Trades" of this Section.
  - 3. Sprinkler system design - Prepare computer program generated hydraulic calculations in accordance with NFPA 13 to substantiate compliance with hydraulic design requirements. Submit name of software program used
  - 4. Provide hydrant flow test data less than one year old conforming to NFPA 291. In case of a winter test, provide comparison to local water department tests or estimates of minimum summer flow and pressure for basis of design. The lesser combined flow and pressure test results shall be used for the hydraulic design of the system.
  - 5. Pipe, fittings and mechanical couplings.
  - 6. Valves.
  - 7. Sprinkler heads.
  - 8. Alarm check valves.
  - 9. Alarm initiating devices.
  - 10. Fire department connections.
  - 11. Backflow preventers Submit a layout drawing indicating the location of all backflow preventers to the Massachusetts Department of Environmental Protection (DEP) for their approval prior to submitting to the Engineer.
  - 12. Pressure gauges.
  - 13. Pipe hangers and supports.
  - 14. Identification signs

- C. Submit all other data as specified herein.
- D. "As-built" copies of all shop drawings shall be submitted to the Engineer before final inspection and acceptance.
- E. The responsibility for all dimensions to be confirmed and correlated at the job site and for coordination of this work with the work of all other trades is also included under the work of this Section 15300 - Fire Protection.
- F. No material shall be ordered or shop work started until the Engineer's approval of shop drawings has been given.

#### 1.4 QUALITY ASSURANCE

##### A. Requirements of the Regulatory Agencies

1. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Architect, Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and approval, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.
2. State and Local Building Codes including, but not limited to, NFPA 13 as adopted by the State of Massachusetts and 248 CMR 2.00 Massachusetts Uniform Plumbing Code.
3. Massachusetts Department of Environmental Protection
4. Local Fire Department
5. Local Water and Sewer Authority or Department
6. Occupational Safety and Health Administration (OSHA)
7. Any other local codes or requirements of Authorities Having Jurisdiction

B. Materials and equipment used shall be Underwriters Laboratories, Inc. or Factory Mutual listed wherever standards have been established by that agency.

##### C. Qualifications of Installer

1. Prior to installation, submit data showing the name and license of the installer and that they has successfully installed systems of the same type and design as specified herein. Data shall include names and locations of at least two installations of such systems. Indicate type and design of each system and certify that each system has performed satisfactorily in the manner intended for not less than 18 months. The

installer shall be licensed to perform applicable fire protection systems installation in the state in which the project is located.

2. Qualifications of System Technician: Installation drawings, shop drawing and as-built drawings shall be prepared by, or under the supervision of, an individual who is experienced with the types of work specified herein, and is currently certified by the National Institute for Certification in Engineering Technologies (NICET) as an engineering technician with minimum Level-III certification in Automatic Sprinkler System program. Submit data for approval showing the name and certification of all involved individuals with such qualifications at or prior to submittal of Working Drawings.
3. Qualifications of Welders: Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures, welders and welding operators shall be qualified in accordance with ASME BPV IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. The Authority Having Jurisdiction shall be notified 24 hours in advance of any required testing and the tests shall be performed at the work site. The welder or welding operator shall apply his assigned symbol near each weld he makes as a permanent record. Prior to installation, submit data for approval showing the name and certification of each welder and welding operator to be used on the project. Submit each welder's identification symbols, assigned number, or letter, used to identify work of the welder. Welders making defective welds after passing a qualifications test shall be given requalification test and, upon failing to pass this test, shall not be permitted to work on the Contract.
  - i. Each welder shall have a copy of a certified ASME qualification test report. Conduct a qualification test for each welder and submit results for approval.
  - ii. Submit welding procedure specifications for metals included in the Work.

#### D. Qualifications of Construction Supervisor

1. Provide a Construction Supervisor with a minimum of 5 years of experience in fire protection construction supervision who shall be responsible for the installation of the Work of this Section of the Contract Specifications. The Construction Supervisor shall be licensed to perform applicable fire protection systems supervision in the state in which the project is located. Prior to installation, submit data for approval showing the name and license of the Construction Supervisor.

#### E. Qualifications of Fire Protection Engineer

1. Design and construction control shall be by, or under the supervision of, a registered fire protection engineer licensed in the state in which the project is located.

- F. Certification - Submit documentation certifying completion of the following items in compliance with this Section.

1. Preliminary tests
2. Flushing
3. Manufacturers' services
4. Disinfection

#### G. REFERENCES

1. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears
2. AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)
  - i. ASTM A36 Carbon Structural Steel
  - ii. ASTM A 47 Malleable Iron Castings
  - iii. ASTM A 53 Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless
  - iv. ASTM A 135 Electric-Resistance-Welded Steel Pipe
  - v. ASTM A 183 Carbon Steel Tract Bolts and Nuts
  - vi. ASTM A 536 Ductile Iron Castings
  - vii. ASTM A 795 Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use
  - viii. ASTM B 88 Seamless Copper Water Tube
3. AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

  - v. UL 789 Indicator Posts for Fire-Protection Service
  - vi. UL Fire Prot Dir Fire Protection Equipment Directory

## H. Tests

1. Formal tests and inspections.
2. Backflow preventer tests.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

#### 1.6 COORDINATION

- A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow speedy and efficient completion of the work.
- B. Furnish to other trades advance information on locations and sizes of all frames, boxes, sleeves and openings needed for their work, and also furnish information and shop drawings necessary to permit trades affected by the work to install same properly and without delay.
- C. In all spaces, prior to installation of visible material and equipment, including access panels, review all contract Drawings for exact locations and where not definitely indicated, request information. Where the fire protection work shall interfere with the work of other trades, assist in working out the space conditions to make satisfactory adjustments before installation. Without extra cost to the Owners, make reasonable modifications to the work as required by normal structural interferences. Maintain maximum headroom at all locations. All conduit, and associated components to be as tight to underside of structure as possible.
- D. If any fire protection work has been installed before coordination with other trades so as to cause interference with the work of such trades, all necessary adjustments and corrections shall be made by the trades involved without extra cost to the owners.
- E. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution for review and approval.
- F. Protect all materials and work of other trades from damage which may be caused by the fire protection work, and repair all damages without extra cost to the owner.
- G. Prepare and submit for approval Coordination Drawings consisting of 1/8 inch=1'0" scale or larger working plans and sections, clearly showing how this Work is to be installed in relation to the work of other Sections. Coordination Drawings shall be based upon approved equipment submittals. The HVAC FSB will prepare backgrounds for Coordination Drawings for all buildings in this Contract and will indicate all ductwork. These Coordination Drawings shall be used to work out the coordination of all work of all trades as specified in each applicable Section. Show and coordinate the Work of this Section on said Coordination Drawings.
- H. Sleeves and Forms for Openings

1. Provide and place all sleeves for pipes penetrating floors, walls, partitions etc. Locate all necessary slots for fire protection work and form before concrete is poured.

I. Cutting and Patching

1. All openings required by the work of these Sections shall be planned for in advance. Any cutting and patching required by the lack of such planning shall be done by the General Contractor at the expense of this Fire Protection FSB. It will be the responsibility of this Fire Protection FSB to keep the General Contractor informed of all required openings.

1.7 DESIGN CRITERIA

- A. Design automatic wet pipe fire extinguishing sprinkler systems in accordance with the required and advisory provisions of NFPA 13, except as modified herein. Design sprinkler systems by hydraulic calculations for uniform distribution of water over the design area. Discharge from individual heads in the hydraulically most remote area shall be between 100 percent and 120 percent of the specified density. Each system shall include materials, accessories, and equipment inside and outside the building to provide each system complete and ready for use. Design and provide each system to give full consideration to blind spaces, piping, electrical equipment, lights, ducts, and other construction and equipment in accordance with detailed Working Drawings to be submitted for approval. Provide sprinkler heads and piping system layout.
- B. Location of Sprinkler Heads
  1. Heads in relation to the ceiling and the spacing of sprinkler heads shall not exceed that permitted by NFPA 13 for ordinary hazard occupancy. 130 square feet per head. Uniformly space sprinklers on the branch piping
- C. Water Distribution
  1. Distribution shall be uniform throughout the area in which the sprinkler heads will open. Discharge from individual heads in the hydraulically most remote area shall be 100 percent of the specified density.
- D. Density of Application of Water
  1. Size pipe to provide the specified density when the system is discharging the specified total maximum required flow. Application to horizontal surfaces below the sprinklers shall be 0.15 gpm per sq ft.
- E. Sprinkler Discharge Area
  1. Area shall be the hydraulically most remote 1950 sq ft area as defined in NFPA 13.
- F. Outside Hose Allowances

1. Hydraulic calculations shall include an allowance of 250 gpm for outside hose streams.

G. Friction Losses

1. Calculate losses in piping in accordance with the Hazen-Williams formula with 'C' value of 120 for steel piping, 150 for copper tubing, and 140 for cement-lined ductile-iron piping.

H. Water Supply

1. Base hydraulic calculations on a residual pressure of 48 psig with 6870 gpm available and a static pressure of 83 psig. Pressures are based on elevation 231 feet at Tree Lane after water main construction.

1.8 COOPERATION AND COORDINATION WITH OTHER TRADES

- A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly when and as directed.
- B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.
- C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.
- D. With the approval of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section of the Contract Specifications required to coordinate with normal structural interference's, or for proper execution of specified work.
- E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section of the Contract Specifications at no additional cost to the Owner.
- F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section of the Contract Specifications and be responsible for repairing any damages caused by such work without any additional cost to the Owner.
- G. Follow Contract Drawings in layout work. Check Contract Drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section of the Contract Specifications will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

- H. Prepare and submit for approval Coordination Drawings consisting of 1/8 inch=1'0" scale or larger working plans and sections, clearly showing how this Work is to be installed in relation to the work of other Sections. Coordination Drawings shall be based upon approved equipment submittals. The HVAC FSB will prepare backgrounds for Coordination Drawings for all buildings in this Contract and will indicate all ductwork. These Coordination Drawings shall be used to work out the coordination of all work of all trades as specified in each applicable Section. Show and coordinate the Work of this Section on said Coordination Drawings.
- I. Attend regular coordination and job progress meetings required.

## 1.9 COORIDINATION DRAWINGS

- A. The HVAC FSB shall prepare a complete set of AutoCAD format floor plans and sections" background drawings at scale not less than 3/8" equals 1'-0", showing structure and other information as needed for coordination. These will be the Coordination Drawings.
- B. Each of the below specialty trades shall add its work to these background drawings in different colors and layers with appropriate elevations and grid dimensions. Specialty trade information is required for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.
  - 1. HVAC Systems and all sheet metal work.
  - 2. Plumbing Systems.
  - 3. Sprinkler System.
  - 4. Electrical System including light locations.
- C. Where conflicts occur with placement of materials of various trades, the HVAC FSB will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade.
- D. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- E. The HVAC FSB shall make AutoCAD electronic file of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Architect/Engineer and have been reviewed
- F. Review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.

G. The HVAC FSB shall provide the following distribution of documents:

1. Electronic file of the Coordination Drawings to each specialty trade and affected Subcontractor for their use.
2. Electronic file of the Coordination Drawings to the Engineer.
3. Electronic file of the Coordination Drawings to General Contractor.

H. Coordination Drawings include but are not necessarily limited to:

1. Structure.
2. Partition/room layout.
3. Ceiling tile and grid.
4. Light fixtures.
5. Access panels.
6. Sheet metal, grilles, diffusers, etc
7. Domestic water, gas, soil, waste and vent piping and associated valves.
8. Electrical conduit runs above 2" and electrical equipment.
9. Sprinkler piping, heads and mounting brackets.

## PART 2 – PRODUCTS

### 2.1 GENERAL

- A. Material and equipment for fire protection service shall be UL Fire Prot Dir listed and/or FM P7825 approved for use in wet pipe sprinkler systems where such classes of material and equipment are available as listed or approved by these organizations.
- B. Where applicable, all products requiring approval by the Massachusetts Department of Public Safety shall be so approved.

### 2.2 PIPE, FITTINGS AND MECHANICAL COUPLINGS

- A. NFPA 13, except as modified herein. Plain-end fittings with mechanical couplings and fittings which use steel gripping devices to bite into the pipe when pressure is applied will not be permitted. Rubber gasketed grooved-end pipe and fittings with mechanical couplings shall be permitted in pipe sizes 1 1/2 inch and larger. Fittings, mechanical couplings, and rubber gaskets shall be supplied by the same manufacturer. Steel piping with wall thickness less than Schedule 30 shall not be threaded.

- B. All black steel pipe shall be preoxidized with a suitable protective coating. Drain pipe and fittings shall be hot dipped galvanized inside and out.
- C. Schedule 40 Steel Pipe: ASTM A53, Type E or S, Grade B black steel pipe for sizes 1-1/4 inch and smaller, and for all piping upstream of alarm check valves and pre-action deluge valves. Pipe 1-1/4 inch and smaller shall be joined by screwed joints in accordance with specification ANSI B 1.20.1. Pipe 1 1/2 inch and larger shall be joined by welded joints in accordance with the American Welding Society Standard AWS D10.9, flanged joints, or by mechanical couplings. Pipe ends shall have rolled grooves. Cut grooving shall not be permitted.
- D. Schedule 10 Steel Pipe: ASTM 135 black steel pipe for sizes 1-1/2 inch and larger for all piping downstream of alarm check valves and pre-action deluge valves. Pipe 1 1/2 inch and larger shall be joined by welded joints in accordance with the American Welding Society Standards AWS D10.9 or by mechanical couplings. Pipe ends shall have rolled grooves. Cut grooving shall not be permitted.
- E. Screwed fittings shall be cast iron, class 125, black, and in accordance with ASME B 6.4 or malleable iron, class 150, black, and in accordance with ASME B 16.3.
- F. Welded fitting shall be steel, standard weight, black, and in accordance with ASME B16.9.
- G. Flanged fittings shall be cast iron, short body, class 175. Flange bolts shall be hexagon head machine bolts with heavy finished hexagon head nuts, and washers, cadmium plated, having dimensions in accordance with ANSI B 18.2.
- H. Grooved mechanical couplings and fittings shall be NFPA 13 approved and consist of combination housings and gaskets. Housings shall either be malleable iron ASTM A47 or ductile iron ASTM A536. Gasket material shall be Listed for the intended service and shall be Grade "E", EPDM.
- I. Expansion: When crossing building expansion or seismic joints, expansion or seismic loops, as required by NFPA 13, shall be installed with the appropriate couplings to allow for expansion in agreement with that as provided for by the building joint. Piping shall be securely anchored to the building structure on both sides of the building expansion and/or seismic joint.
- J. Provide fittings for changes in direction of piping and for connections. Perform welding in the shop; field welding shall not be permitted. Conceal piping in areas with suspended ceiling.

### 2.3 SPRINKLER HEADS

- A. Provide nominal 0.50 inch or 0.53 inch orifice sprinkler heads. O-rings will not be permitted in sprinkler heads. Release element of each head shall be of the ordinary temperature rating or higher as required by NFPA 13. Provide corrosion-resistant sprinkler heads and sprinkler head guards as required by NFPA 13. Provide sprinkler

heads as indicated. Deflector shall not be more than 3 inches below suspended ceilings. Ceiling plates shall not be more than 0.5 inch deep. Ceiling cups shall not be permitted.

- B. Sprinkler heads located in uninhabited areas without ceilings (mechanical rooms, storage rooms, etc.) and combustible concealed spaces above ceilings shall be of conventional design, upright style, and shall have a rough brass finish.
- C. Sprinkler heads located in inhabited areas without ceilings shall be of conventional design upright style and shall have a polished chrome finish.
- D. Sprinkler heads located in areas with suspended or finished ceilings shall be of conventional design, concealed recessed adjustable style, with white colored cap.
- E. Sprinkler Head Guards: Provide head guards on all sprinkler heads in mechanical rooms, in storage rooms, in pump rooms, on all pendent-mounted sprinkler heads within 7'-0" of any floor or stair, and elsewhere where susceptible to accidental damage. Guards shall be constructed of galvanized wire with locking device to permit authorized removal for sprinkler and head repair. Do not provide guards on sidewall heads.
- F. Spare Heads Cabinet: Provide metal cabinet with extra sprinkler heads and two sprinkler head wrenches for each type of head adjacent to each alarm check valve. The number and types of extra sprinkler heads shall be as specified in NFPA 13.

## 2.4 VALVES

- A. NFPA 13. Provide valves of types approved for fire service. Gate valves shall open by counterclockwise rotation that shall be confirmed with the Fire Department prior to valve submittal. Provide an OS&Y gate valve beneath each alarm check valve.
  - 1. Gate Valves 2-1/2 inch and larger: Outside screw and yoke indicating type, iron body, bronze mounted gate valves, straightway pattern, flanged ends, 175 psig working water pressure.
  - 2. Gate Valves 2 inch and smaller: Outside screw and yoke indicating type, bronze body, straightway pattern, screwed ends, 175 psig working water pressure.
  - 3. Butterfly Valves: Indicator type, built-in double pole/double throw tamper switch, 175 psig working water pressure. Butterfly valves of sizes up to 6 inch shall have locking type handles. Butterfly valves 8 inch size shall have gear operators. Butterfly valves may be substituted for gate valves except where NFPA/Underwriter specifically requires an outside screw and yoke gate valve.
  - 4. Check Valves 2-1/2 inch and Larger: Iron body, bronze mounted, flanged ends, swing type for placement in the horizontal position, 175 psig working water pressure. Provide flanged inspection and access cover plate for check valves 4 inch and larger.

5. Check Valves 2 inch and smaller: Iron body, stainless steel trim, EPDM seal, screwed ends, silent check type, 200 psig working water pressure.
6. Drain and Inspectors Test Valves: Bronze globe valve with integral bronze seat, renewable disc, union bonnet, inside screw rising spindle, suitable for 300 psig non-shock cold water.
7. Backflow Preventer Test Valves: 2-1/2 inch hose gate valve, iron body, bronze mounted, straightway or angle pattern, flanged end, 175 psig working water pressure. Provide hose threads to suit local fire department with cap and chain.
8. Automatic Ball Drip Valve: 1/2-inch, bronze body, corrosion resistant metal ball and spring, threaded ends, 175 psig working water pressure.

B. Valve Assemblies

1. Alarm Check Valve Assemblies: Provide variable pressure type alarm valve complete with retarding chamber, alarm test valve, alarm shutoff valve, drain valve, pressure gages, accessories, and appurtenances necessary for the proper operation of the system.

## 2.5 ALARM INITIATING DEVICES

- A. Provide switches with circuit opener or closer for the automatic transmittal of an alarm over the facility fire alarm system and electric alarm bell where so indicated. Connection of switch shall be under Section 16721 - Fire Alarm System.

1. Flow Switches: Provide vane-type water flow switches. Each flow switch shall be equipped with plastic paddle. Alarm actuating device shall have mechanical diaphragm controlled retard device adjustable from 10 to 60 seconds and shall instantly recycle. Provide two sets of single pole double throw (spdt) contacts for wiring to the fire alarm system. Potter-Roemer VSR-F Series, Gem, Reliable, Autocall, or approved equal. Flow switches shall be sized for the piping in which installed to ensure proper fit.
2. Tamper (Supervisory) Switches: Provide on all control valves, closed circuit supervisory tamper switches mounted in accordance with UL standard. Minimum contact ratings shall be 2.5 amps at 24 volt DC. Provide supervision against valve closure or tampering of valve. Switches shall be suitable for indoor installation (outdoor location for post indicator valves), and have sealed and gasketed enclosures. Switches shall have dual contacts for wiring the item to fire alarm system under other sections of these Contract Specifications. Potter-Roemer 6220 (OS&Y), 6221 (rising stem globe valve), or 6223 as required, Gem, Reliable, Autocall, or approved equal.

## 2.6 FIRE DEPARTMENT CONNECTIONS

- A. Provide 4 inch single Storz type connection approximately 3 feet above finish grade. Fire department connections shall have hose threads to suit local fire department with caps, chains, and identifying fire department connection escutcheon plate
- B. Coordinate location with Engineer, Owner and Fire Department prior to installation.

## 2.7 SIGHT DRAINS

- A. Reliable Model B or equal, one inch, to suit.

## 2.8 BACKFLOW PREVENTERS (DOUBLE CHECK VALVE ASSEMBLY)

- A. Provide reduced pressure principle backflow preventer with OS&Y gate valve on both ends. Backflow prevention assemblies shall have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List. Listing of the specific make, model, design, and size in the FCCCHR List shall be acceptable as the required documentation."
- B. Provide strainer without screen.

## 2.9 PRESSURE GAUGES

- A. Pressure gauges shall be ASME B40.1, liquid filled, 1 percent accuracy or better, with bronze bourdon tube and steel or brass case, as manufactured by U.S. Gauge American, Mueller, Terice, Ashcroft or approved equal.
- B. Gauges shall have a minimum 3 inch diameter face. Dial gradations reading in "PSIG" shall be such that the normal operating pressure of the system installed shall be indicated near the middle of the scale.
- C. Gauges shall be equipped with a ball valve shutoff and snubber. An outlet, at least 1/4 inch size, plugged for the installation of the inspector's gauge shall be located between each valve and gauge.

## 2.10 PIPE HANGERS AND SUPPORTS

- A. Provide in accordance with NFPA 13. Attach to steel joists with MSS SP-58, Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel and wood with drilled hole on centerline and double nut and washer. Attach to concrete with Type 18 insert or drilled expansion anchor. All hangers and supports, exposed and concealed, shall be galvanized for all areas except for chemical rooms in which stainless steel shall utilized.

## 2.11 PIPE SLEEVES

- A. Sleeves in Masonry and Concrete Walls, Floors, Ceilings, and Flat Roofs: Standard Weight hot-dip galvanized steel, ductile-iron or cast-iron pipe sleeves.
- B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.

## 2.12 PIPE ESCUTCHEONS

- A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view as specified herein with inside diameter closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.
- B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

## 2.13 DRIP PANS

- A. Examine all Contract Drawings and in cooperation with the Electrical FSB confirm the final location of all new electrical equipment to be installed in the vicinity of new and existing piping. All overhead piping containing liquid or vapor shall be no closer than 3 feet from a vertical line to electrical equipment including, but not limited to, electric motors, controllers, switchboards, panelboards, and similar equipment.
- B. Where the installation of new automatic sprinkler systems piping does not comply with the requirements of the foregoing paragraph, where feasible the piping shall be relocated. Where not feasible, provide drip pans as specified below, except as otherwise indicated on the Contract Drawings.
- C. Provide drip pans fabricated from 18 gauge galvanized steel sheet or 16 ounce cold rolled copper sheet with watertight joints, and with edges turned up 2-1/2 inches. Reinforce top edge, either by structural angles or by rolling top over 1/4 inch rod made of same material as drip pan sheet metal. Provide hole, gasket, and flange at low point for watertight joint and 1 inch drain line connection.
- D. Locate drip pans under piping passing over or within 3 feet horizontally of electrical equipment defined above, and elsewhere as indicated. Hang from structure with rods and building attachments, weld rods to sides of drip pan. Carefully pitch to a convenient point for drainage. Brace to prevent sagging or swaying. Connect 1 inch drain line to drain connection and run to nearest plumbing drain or elsewhere as indicated. Drip pans shall be installed within 12 inches below piping.

## 2.14 SUPPLEMENTARY STEEL, CHANNELS AND SUPPORTS

- A. Provide all supplementary steel, factory fabricated channels and supports required for proper installation, mounting and support of all equipment and systems provided under this Section.

- B. Supporting channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.
- C. All supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be hot dipped galvanized for all areas except for chemical rooms in which stainless steel shall utilized..

## 2.15 IDENTIFICATION SIGNS

- A. NFPA 13. Attach properly lettered and approved metal signs to each control valve and test valve. Permanently affix hydraulic design data nameplates to the riser of each system.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Installation, workmanship, inspection, and testing shall be in accordance with NFPA 13 and NFPA 24, with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other approved methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position. Provide Teflon pipe thread paste on male threads.
- B. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.
- C. Install aboveground pressurized piping to permit draining of all sections of each piping systems without traps. Pitch piping back to system low points. Provide drain valves at all piping low points.
- D. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Make provisions in buried piping for differential settlement. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.
- E. Sprinkler Heads Locations
  - 1. Sprinkler head locations shall be coordinated with all surface mounted items, such as cornices, curtains, low soffits and lighting fixtures and shall be located accordingly. Extended escutcheons may be utilized where heads cannot be moved, if approved by the Engineer.
  - 2. Sprinkler heads and piping locations shall be determined by actual field measurements. Care shall be taken to avoid obstruction of structural members, equipment, fixtures, lighting, ducts, other piping, ceiling tile supports, etc.

3. When sprinkler heads are shown on the reflected ceiling plan, they shall be so located. Unless specifically indicated otherwise, sprinkler heads shall be installed in the centers of tiles.
4. Sprinkler heads are to be provided above suspended ceilings in combustible concealed spaces with 6 inches or greater space between the bottom of joists and ceiling assembly. Sprinklers in these concealed spaces shall be located with deflectors a minimum of 1" and maximum of 6" below the bottom of the joists. Head spacing within these spaces shall not exceed 130 ft<sup>2</sup> per head. Provide additional heads in concealed spaces not identified on the Contract Drawings or where ducts, equipment, etc. create obstructions.

#### F. Test Connections

1. Inspector's Test Connections: Provide inspector's test valve approximately 6 feet above the floor in readily accessible location for each sprinkler system or portion of each sprinkler system equipped with a flow or pressure switch. Pipe from the end of the hydraulically most remote part of each system. Provide test connection piping to a drain location that can accept full flow where the discharge will be readily visible and where water may be discharged without property damage. Discharge to janitor sinks or similar fixtures shall not be permitted. Provide smooth bore corrosion resistant discharge orifice of same size as corresponding sprinkler orifice giving flow equivalent to one sprinkler. The penetration of the exterior wall shall be no greater than 2 feet above finished grade.
2. Backflow Preventer Test Connection: Provide test valves downstream of the backflow preventer assembly. Provide one valve for each 250 gpm of system demand or fraction thereof. Provide a permanent sign in accordance with paragraph entitled "Identification Signs" which reads, "Test Valve."

#### G. Main Drains

1. Provide separate drain piping to discharge at safe points outside each building of adequate size to readily receive the full flow from each drain under maximum pressure. Provide auxiliary drains as required by NFPA 13. Provide precast concrete splash block under each exterior drain discharge. The penetration of the exterior wall shall be no greater than 2 feet above finished grade. Main drain pipe and valve shall support full flow at system demand.

#### H. Pipe Hangers and Supports

1. The hanging and supporting of all piping and equipment shall conform to the requirements of NFPA 13 and the manufacturer's recommendations.
2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be 6 inches clear from other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions. Where insulation or other covering is provided, minimum clearance shall take into account such covering.
4. Supplementary steel and channels shall be firmly connected to the building construction in a manner approved by the Engineer, or as otherwise shown on the Contract Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.
5. Seismic Pipe Hanging Requirements:
  - i. Seismic protection of all fire suppression piping shall comply with the requirements of NFPA 13 and Massachusetts State Building Code. Seismic bracing shall be provided for all piping larger than or equal to 2-1/2 inch. All feed mains regardless of size shall be braced.
  - ii. The Fire Protection FSB shall have the option of substituting alternate seismic supports and anchors provided his submittals are accompanied by calculations and shop drawings signed and sealed by the Fire Protection Engineer.
  - iii. All mechanical materials and equipment including all pipes shall be supported and anchored to resist the external seismic forces for seismic hazard exposure Group [IIID]. Force shall be resisted without failure or permanent displacement when it is applied in any direction, and shall conform to the Massachusetts State Building Code.
  - iv. The ends or all branch lines shall be provided with an acceptable method of lateral restraint. The use of a wrap around "U" hanger, or band hanger at 45 degree angle is acceptable.
  - v. Acceptable manufacturers of seismic bracing are: TOLCO Incorporated; Corona, California.
  - vi. All seismic braces shall be Listed for tension and compression service.
  - vii. All braces shall utilize ordinary black steel piping as the prime support member.
  - viii. Structural connection
    - (a) All bracing shall be connected to the building's structural members.
    - (b) All means of connection to the building's structure and sprinkler pipe shall be Listed for the intended use.
  - ix. At a minimum, the bracing shall be provided a maximum of 40 feet between lateral braces and 80 feet between longitudinal braces. However, if the pipe installation positioning selected by the Fire Protection FSB requires additional bracing, these locations and types of braces shall be submitted for review and shall be provided at no additional cost.

#### I. Pipe Through-Penetrations

1. Furnish pipe sleeves where piping passes through walls, floors, ceilings, roofs, and partitions. Sleeves will be installed, and secured in proper position and location during construction by the trade whose element will be penetrated. Such trades

include concrete, masonry, steel siding in the case of a steel building, and dry wall and/or plaster in the case of framed construction. Core drilling of masonry and concrete may be provided by this Section in lieu of pipe sleeves when cavities in the core-drilled holes are completely grouted smooth. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors, ceilings, roofs, and partitions.

2. Pipe Penetrations Through Building Interior Construction: Provide not less than 1/4 inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable silicone. Seal both ends of penetrations through fire rated assemblies to maintain fire resistive integrity with UL listed fill, void, or cavity material.
3. Pipe Penetrations Through Building Exterior Construction: Provide a bolted collars that sealed against the metal wall and is sealed with a disk-seal. Collar and disk-seal sized as recommended by seal manufacturer.
4. Extend sleeves in floor slabs 2 inches above the finished floor. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.
5. Seismic-braced pipe
  - i. Proper clearances between penetrating sprinkler system piping, including drains and fire department connections, and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-1/2 inch nominal, and 4 inches larger for 4 inch and larger nominal diameter pipe.
  - ii. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

#### J. Cross Connections and Interconnections

1. No equipment, devices or piping shall be installed which will provide a cross or interconnection between a distribution water supply and a drainage, soil or waste pipe which will permit or make possible the backflow of sewage, polluted water or waste into the water supply system.

#### K. Connections to Water Supply Systems

1. Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around the main piping; bolt valve to the branch connection. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, all without interruption of service. Notify the Fire Protection Engineer in writing at least 15 days prior to connection date and receive approval before any service is interrupted. Furnish materials required to make connections into existing water supply systems, and perform excavating, backfilling, surface restoration and other incidental labor as required.

### 3.2 CORING

- A. Provide all coring for conduits penetrating floors, walls, partitions etc.
- B. Provide waterproof sealing for the penetrations through exterior walls, etc.
- C. Foam type water proofing is not allowed.

### 3.3 DISINFECTION

- A. Disinfect the new water piping in accordance with the specified Plumbing Code with the additions specified herein or AWWA C651 whichever is more stringent. Fill piping systems with chlorine solution and allow solution to stand. Following the required standing time, flush solution from the systems with domestic water until maximum residual chlorine content is within the range of 0.2 to 0.5 ppm, or the residual chlorine content of domestic water supply. Obtain at least two consecutive satisfactory bacteriological samples from new water piping, analyzed by a certified laboratory, and submit results prior to the new water piping being placed into service. Disinfection of systems supplied by nonpotable water (service water) is not required.
- B. Where it is not possible to disinfect a potable water storage tank as specified above, the entire interior of the tank shall be swabbed with a solution which contains 200 parts per million of available chlorine; and the solution shall than be allowed to stand 3 hours before the tank is flushed and returned to service.
- C. For a potable water filter or similar device, the dosage shall be determined by the Massachusetts Department of Environmental Protection.

### 3.4 FIELD QUALITY CONTROL

- A. After piping installation has been completed and prior to initial operation, inspect piping systems for compliance with Contract Drawings, Contract Specifications, and approved submittals. As part of inspection, perform tests and flushing in compliance with the specified requirements.
- B. Preliminary Tests
  1. Perform pressure tests specified herein. Prior to application of test pressure, remove or valve off piping components which may be damaged by test and install a calibrated pressure gage in each system. In the even of leakage, locate and repair leak by remaking joints and/or replacing piping sections and repeat test. Material and equipment used in testing shall be subject to inspection by the Engineer. Provide electricity, instruments, connecting devices, and personnel for the tests. Correct defects in the Work and repeat tests until the Work is in compliance with contract requirements. Owner will furnish water for piping testing up to 10 percent of piping volume to be tested. Pay for test water losses greater than 10 percent. Pressure test each system hydrostatically at 200 psig for a 2 hour period with no leakage or reduction in pressure.
  2. Provide alarm tests for each alarm initiating device.

3. Provide flow tests for each riser, backflow preventer, and zone.

#### C. Backflow Preventers Test Report

1. Backflow preventers shall be tested by a locally approved and certified backflow assembly tester. A copy of the test report shall be provided to the Engineer and Owner prior to placing the domestic water system into operation, or no later than 5 days after the test.

#### D. Formal Tests and Inspections

1. Do not submit a request for formal test and inspection until the preliminary test and corrections are completed and approved. Submit a written request for formal inspection at least 15 days prior to inspection date. An experienced technician regularly employed by the system installer shall be present during the inspection. At this inspection, repeat any or all of the required tests as directed. Correct defects in Work, and repeat tests until Work is in compliance with contract requirements. Furnish equipment, electricity, instruments, connecting devices, and personnel for performing tests. The Owner will furnish water for the tests. The Fire Protection Engineer shall witness formal tests and approve systems before they are accepted. When tests have been completed and corrections made, submit a signed and dated test report, similar to that specified in NFPA 13.

#### E. Flushing

1. After completion of testing and before placing in operation, flush all new sprinkler piping including feed mains in accordance with Factory Mutual Loss Prevention Data Sheet 2-81, Sprinkler System Maintenance, Section 9.5 using the hydraulic method at a flow rate to achieve a minimum scrubbing velocity of 10 ft/sec. Flush entire sprinkler system as required to remove all foreign matter, under pressure as specified in NFPA 13. Use the permanent fire water service at its maximum available pressure for the source of flushing water. Flush piping through each sprinkler head outlet before sprinkler heads are installed. Flush until water runs clean. Discharge used water to sanitary system.

### 3.5 CONTRACT CLOSEOUT

#### A. Provide in accordance with Section 01700 – Contract Closeout

#### B. Operation and Maintenance Manuals - Prepare manuals in accordance with Section 01730. Submit a certified list of qualified service organizations for support of the equipment which includes their addresses and qualifications.

1. Alarm check valves
2. Valves
3. Alarm initiating devices
4. Backflow preventers

- C. Record drawings shall be provided by this Fire Protection FSB as specified in Section 00700 - General Conditions and Section 01170 - Special Provisions.
- D. All special tools necessary for the operation and maintenance of the Fire Protection system and equipment shall be furnished. Wrenches for the removal of each type of sprinkler head installed shall be furnished within the spare sprinkler head cabinet at the Alarm Check assembly or where directed by the Engineer.
- E. Provide warranty and guarantee on all equipment furnished and work performed for a period of one (1) year from the date of substantial completion.

END OF SECTION 15300

## SECTION 15400

### PLUMBING

(Part of Filed Sub-Bid Section 15001 - PLUMBING – Filed Sub-Bid Required)

#### PART 1 - GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

- 1. 15400 – Plumbing

- B. Related Sections include the following:

- 1. Division 0 – Bidding and Contract Requirements
  - 2. Division 1 – General Requirements

- C. Work included:

- 1. The Work of this section includes all labor, tools, material, fittings, accessories and equipment necessary to provide plumbing system(s), complete and operable and in accordance with this section of these specifications, the drawings and the standards of the applicable codes listed therein.

- 2. The Plumbing FSB shall be responsible for the following:

- i. Demolition and removal of gas piping at Well 4.
    - ii. Water supply system
    - iii. Domestic cold water distribution system.
    - iv. Domestic hot water system; including water heater and gas vent.
    - v. Tempered water distribution system to emergency eye wash/drench hose stations.
    - vi. Acid neutralization piping and tank.
    - vii. Natural Gas supply system underground from the street to the building and throughout the building connecting to each and every appliance requiring gas. This includes high pressure and low pressure gas services for the Generator and building heating appliances. NOTE: A high pressure gas permit will be required for the Generator service.
    - viii. Gas vent piping from **all** gas fired appliances, including connection to concentric vent kits furnished by the HVAC FSB contractor.

- ix. Bathroom with water closet and lavatory.
  - x. Floor drains.
  - xi. Trench drains
  - xii. Hose bibs and wall hydrants.
  - xiii. Portable Sump Pump – Purchased by Plumbing FSB and furnished to Owner.
  - xiv. Install water meter furnished by the Owner.
  - xv. Furnish and install pipe sleeves.
3. The Work shall include the furnishing, set-up and maintenance of all derricks, hoisting machinery, scaffolds, staging, planking, ladders, etc. as required for the Work.
  4. Secure all permits, inspection, and approvals and pay all costs and fees.
  5. Unless the Specifications state "No Substitutions", substitutions will be considered for any specified item.
  6. Coordinate safety program with that of the General Contractor. Cooperate with other trades to establish lines, levels, openings, chases, clearances, and locations to avoid interference, and to protect the Work.

D. Work not included:

1. Section 02220 - Earthwork - Excavation, filling, sheeting, shoring, pumping, dewatering.
2. Section 03300 - Cast-In-Place Concrete
3. Section 16120 - Wire And Cables - Power wiring.
4. Masonry FSB shall handle interior openings.
5. Painting of Trap Primer cabinet shall be by Painting Contractor.

### 1.3 COORDINATION DRAWINGS

- A. The HVAC FSB shall prepare a complete set of AutoCAD format floor plans and sections background drawings at a scale not less than 3/8" equals 1' 0", showing structure and other information as needed for coordination. These will be the Coordination Drawings.
- B. Each of the below specialty trades shall add its work to these background drawings in different colors and layers with appropriate elevations and grid dimensions. Specialty trade information is required for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.

1. HVAC Systems and all sheet metal work.
  2. Plumbing Systems.
  3. Fire Protection System.
  4. Electrical System including light locations.
- C. Where conflicts occur with placement of materials of various trades, the HVAC FSB will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade.
- D. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- E. The HVAC FSB shall make AutoCAD electronic file of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Architect/Engineer and have been reviewed.
- F. Review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.
- G. The HVAC FSB shall provide the following distribution of documents:
1. Electronic file of the Coordination Drawings to each specialty trade and affected Subcontractor for their use.
  2. Electronic file of the Coordination Drawings to the Engineer.
  3. Electronic file of the Coordination Drawings to General Contractor.
- H. Coordination Drawings include but are not necessarily limited to:
1. Structure.
  2. Partition/room layout.
  3. Ceiling tile and grid.
  4. Light fixtures.
  5. Access panels.
  6. Sheet metal, grilles, diffusers, etc
  7. Domestic water, gas, soil, waste and vent piping and associated valves.
  8. Electrical conduit runs above 2" and electrical equipment.

9. Sprinkler piping, heads and mounting brackets.

#### 1.4 SUBMITTALS

- A. Shop drawings, brochures and samples, as listed, shall be submitted for all items to be furnished in accordance with the provisions of Section 00700 - General Conditions and Section 01300 - Submittals.
- B. Provide submittals for the following items consisting of manufacturer's published data. All submittals shall show compliance with the referenced specification.
  1. Water and drain piping and fittings
  2. Natural Gas piping and fittings.
  3. Gas regulators.
  4. Hangers and supports
  5. Sleeves and escutcheons
  6. Plumbing specialties
  7. Plumbing fixtures
  8. Valves
  9. Tankless domestic water heaters (Gas fired and Electric)
  11. Domestic hot water recirculation pump and aquastat.
  11. Gas vent and combustion air inlet to and from all gas fired appliances, including but not limited to, GUH, Makeup Air Unit and Water Heater.
  12. Wall box for ice maker water supply.
  13. Acid neutralization piping and cartridge.
  14. Floor drains
  15. Trench drains.
  16. Portable Sump Pump
  17. Mixing valves
  18. Cleanouts
  19. Piping insulation

#### 1.5 QUALITY ASSURANCE

- A. The Work of this section shall comply with the requirements of the Massachusetts Uniform Plumbing Code (248 CMR) and of any other authorities having jurisdiction.
- B. The equipment covered by the Specifications is intended to be standard equipment of proven quality as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practice of the industry and shall operate satisfactorily when installed in accordance with the Contract Documents. The Specifications call attention to certain details, but do not purport to cover all details entering into the construction of the equipment.

C. All material shall be new and shall bear the manufacturer's full identification. All fixtures, fittings, specialties and materials installed shall be approved by the Commonwealth of Massachusetts.

D. Requirements of the Regulatory Agencies

1. The final, complete installation shall comply with all state and local statutory requirements having jurisdiction. Arrange for all necessary permits, pay all fees and arrange for all required inspections by local authorities. In general, all Work shall comply with the requirements of the rules, regulations, standards, codes, ordinances and laws of local, state and federal governments, and other authorities that have legal jurisdiction over the Project. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:
  - i. Local and state/commonwealth building, plumbing, gas, mechanical, electrical, fire and health department codes.
  - ii. American Gas Association (AGA).
  - iii. National Fire Protection Association (NFPA).
  - iv. Occupational Safety and Health Act (OSHA).
  - v. Underwriter's Laboratories (UL).
  - vi. Material and equipment shall be listed by Underwriter's Laboratories (UL) and approved by ASME and AGA for intended service.
2. When requirements cited in the Specifications conflict with each other or with Contract Documents, most stringent shall govern Work.
3. Most recent editions of applicable specifications and publications of the following organizations form part of Contract Documents:
  - i. American National Standards Institute (ANSI).
  - ii. American Society of Mechanical Engineers (ASME).
  - iii. National Electric Manufacturers Association (NEMA).
  - iv. American Society for Testing and Materials (ASTM).
  - v. American Water Works Association (AWWA).
  - vi. American Society for Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
  - vii. American Society of Plumbing Engineers (ASPE).
  - viii. Thermal Insulation Manufacturers Association (TIMA).
  - ix. Institute of Electrical and Electronics Engineers (IEEE).
  - x. Insulated Cable Engineers Association (ICEA).
  - xi. Cast Iron Soil Pipe Institute (CISPI).
  - xii. Plumbing and Drainage Institute (PDI).

- xiii. National Association of Plumbing-Heating Cooling Sub-Contractors (NAPHCC).

#### 1.6 DELIVERY, STORAGE AND HANDLING

- A. All manufactured materials shall be delivered to the Project Site in original packages or containers bearing the manufacturer's labels and product identification. All materials and equipment shall be shipped, stored, handled and installed in such manner as not to degrade quality, serviceability, or appearance.
- B. Inspect all Plumbing equipment and materials, upon receipt at the Project Site, for damage and correctness.
- C. Store all materials and equipment on site in a location approved by the Engineer. Protect materials against dampness. Store off floors, under cover, and adequately protected from damage.
- D. Protect all Work, the Owner's property and the property of others from injury or loss caused by operations associated with the Work of this section. Make good any such injury or loss, at no cost to the party suffering the injury or loss.
- E. Deliver products to the Project Site and store and protect same as recommended by the manufacturer.

#### 1.7 COORDINATION

- A. Check Contract Drawings as well as Shop Drawings of all trades to verify and coordinate spaces in which Work of this section will be installed.
- B. Coordinate items furnished under this section of the specifications to fit within the building spaces.

#### 1.8 DISCREPANCIES IN DOCUMENTS

- A. Where Contract Drawings or Specifications conflict or are unclear, advise the Engineer in writing before Award of Contract. Otherwise the Engineer interpretation of Contract Documents shall be final, and no additional compensation shall be permitted due to discrepancies or incongruities thus resolved.
- B. Where Contract Drawings or Specifications do not coincide with manufacturers' recommendations, or with applicable codes and standards, alert the Engineer in writing before installation. Otherwise, make changes in installed Work as the Engineer requires at no additional cost to the Owner.
- C. If the required material, installation or Work can be interpreted differently from drawing to drawing, or between Contract Drawings and Specifications, the Plumbing FSB shall provide that material, installation, or Work which is of the higher standard.
- D. Provide systems and components that are fully complete and operational and fully suitable for the intended use. There may be situations in the Contract Documents where insufficient information exists to precisely describe a certain component or subsystem, or the routing of a component. In cases such as this, where the Plumbing FSB has failed to notify the Engineer of the situation in accordance with the Specifications, the Plumbing FSB shall provide the specific component or subsystem with all parts necessary for the intended use, fully complete and operational, and installed in workmanlike manner either concealed or exposed per the design intent.
- E. In cases covered by the Contract Documents, where the Plumbing FSB needs engineering guidance, submit a sketch identifying the proposed solution to the Engineer for approval.

## 1.9 MODIFICATIONS IN LAYOUT

- A. HVAC, Plumbing, Fire Protection and Electrical Drawings are diagrammatic. They indicate general arrangements of mechanical and electrical systems and other Work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet Architectural requirements.
- B. In all spaces, prior to installation of visible material and equipment, including access panels, review Architectural Drawings for exact locations and where not definitely indicated, request information from the Engineer.
- C. Maintain maximum headroom at all locations. All piping and associated components to be as tight to underside of structure as possible.
- D. Make reasonable modifications in layout and components needed to prevent conflict with work of other trades and to coordinate as specified herein. Systems shall be run in a rectilinear fashion.
- E. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to the Engineer for review and approval.

## 1.10 WARRANTIES

- A. Submit manufacturer's standard replacement warranties for material and equipment furnished under this section. Such warranties shall be in addition to and not in lieu of all liabilities, which the manufacturer and the Plumbing FSB may have by law or by provisions of the Contract Documents.
- B. All materials, equipment and Work furnished under this section shall be guaranteed against all defects in materials and workmanship for a minimum period of one year commencing with the Date of Substantial Completion. Any failure due to defective material, equipment or workmanship which may develop, shall be corrected at no expense to the Owner including all damage to areas, materials and other systems resulting from such failures.
- C. Guarantee that all elements of each system meet the specified performance requirements as set forth herein or as indicated on the Contract Drawings.
- D. Upon receipt of notice from the Owner of the failure of any part of the systems during the guarantee period, the affected parts shall be replaced. Any equipment requiring excessive service shall be considered defective and shall be replaced.

## 1.11 PROTECTION OF WORK AND PROPERTY

- A. Care and protect all Work included under this section until it has been tested and accepted.
- B. Protect all equipment and materials from damage from all causes including theft. All materials and equipment damaged or stolen shall be repaired or replaced with equal material or equipment.
- C. Protect all equipment, outlets and openings with temporary plugs, caps and covers. Protect work and materials of other trades from damage that might be caused by Work or workmen under this section and make good damage thus caused.

## 1.12 SPARE PARTS

- A. Furnish spare parts data for each different item of equipment furnished. The data shall include a complete list of parts and supplies, with current unit prices and source of supply; a list of parts and supplies that are either normally furnished at no extra

cost with the purchase of the equipment, or specified hereinafter to be furnished as part of the contract; and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 180 days at the particular installation. The foregoing shall not relieve the Plumbing FSB of any responsibilities under the guarantees specified herein.

### 1.13 SUPPLEMENTARY STEEL, CHANNELS AND SUPPORTS

- A. Provide all supplementary steel, channels and supports required for the proper installation, mounting and support of all plumbing equipment, piping, etc., required by the Specifications.
- B. Supplementary steel and channels shall be firmly connected to building construction in a manner approved by the Engineer.
- C. The type and size of the supporting channels and supplementary steel shall be determined by the Plumbing FSB and shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for loading. Material shall be 316 stainless steel.

## PART 2 - PRODUCTS

### 2.1 GENERAL

#### A. SUPPLY PIPE AND FITTINGS

- 1. Above floor piping shall be Type L copper tubing, ASTM B88, hard tempered, with wrot copper fittings and unions, joints made up with 95/5 tin antimony solder and non-corrosive flux.
- 2. Under ground and under slab piping shall be Type K copper tubing, soft annealed copper tubing with ANSI B16.18 or ASME B16.22 solder joint fittings. Provide minimum number of joints in buried copper tubing. Joints shall be brazed. Brazing filler metal shall conform to AWS A5.8, Type BAg-5 with AWS Type 3 flux, except Type BCuP-5 or BCuP-6 may be used for brazing copper-to-copper joints. Braze joint fittings shall be specifically designed for brazing.

#### B. DRAIN-WASTE AND VENT PIPE AND FITTINGS

- 1. Below grade shall be service weight cast iron soil pipe and fittings, ASTM A74, coated with tar or asphaltum, resilient gasket joints.
- 2. Above grade shall be service weight cast-iron with no hub joints, except piping two inch or smaller may be schedule 40 galvanized steel with 150 lb. galvanized malleable iron drainage fittings, or type DWV copper with wrot copper drainage fittings.

#### C. CLEANOUTS

- 1. ANSI A112.36.2M; provide threaded bronze cleanout plugs.
- 2. Floor Cleanouts
  - i. Provide cast-iron or ductile-iron floor cleanout with anchor flange, adjustable height polished bronze, nickel bronze, stainless steel, or chromium-plated

copper alloy rim and scoriated floor plate with "CO" cast in the plate, and countersunk screws for installing floor plate flush with finished floor.

3. Exterior Cleanouts

- i. Provide cast-iron or ductile-iron floor cleanout with anchor flange, adjustable height polished bronze, nickel bronze, stainless steel, or chromium-plated copper alloy rim and scoriated floor plate with "CO" cast in the plate, and countersunk screws for installing floor plate flush with grade. Cleanout construction including floor plate shall be suitable for exterior installation in non-paved areas. See Bid Drawing P-2 for exterior cleanouts.

D. ACID WASTE AND VENT PIPING

1. Pipe and fittings shall be one of the following:

- i. Flame Retardant Polypropylene meeting ASTM F1412. Connections shall be electro fusion except mechanical joint shall be allowed under laboratory benches. Pipe and fittings shall be manufactured by Georg Fischer, Enfield, Orion or approved equal.
- ii. Special drainage system for corrosive or acid waste shall be manufactured from CPVC Type IV Grade I compounds with a minimum cell classification of 23447. Pipe and Fittings shall conform to ASTM F 2618. Pipe shall be Schedule 40 dimensions. One Step solvent cement shall be specially formulated for chemical waste applications and conform to ASTM F493. All pipe, fittings and cement shall be supplied as a system by a single manufacturer and shall be certified by NSF International for use in corrosive waste drainage systems and shall bear the mark "NSF-cw". Installation to be in accordance with manufacturer's instructions and all applicable local code requirements. Buried pipe shall be installed in accordance with ASTM D 2321 and ASTM F 1668. The system is intended for use in non-pressure chemical waste applications with a maximum working temperature of 220° F.

E. NATURAL GAS PIPING AND REGULATORS

1. UNDERGROUND GAS SUPPLY PIPING

- a. Underground natural gas supply piping shall be equal to Driscoplex 6500 MDPE PE 2708 by Performance Pipe. Pipe shall comply with ASTM D2513, shall have an SDR of 11.5 and shall be UV stabilized to withstand 4 years of exposure.
- b. Piping 2-1/2 inch diameter and larger shall be installed with butt fittings by the same manufacturer.
- c. Piping 2 inches in diameter and less shall be installed with socket type fittings by the same manufacturer.
- d. Detectable Underground Warning Tape shall be approved equal to Seton 5 mil tape with aluminum backing. Tape shall be 6 inch wide with yellow background and black letters.

2. ABOVE GROUND AND IN BUILDING PIPING

- a. Gas supply piping 2 inches and smaller shall be Schedule 40 A 106 black steel piping with malleable iron threaded fittings.
  - b. Gas supply piping 2-1/2 inch diameter and larger shall be Schedule 40 A 53 black steel pipe with ANSI B16.9 butt weld fittings.
3. Gas piping at equipment shall be provided with additional supports.
  4. All work shall be installed in strict accordance with the Massachusetts State Gas Code.
  5. Welders Qualifications (Natural Gas System): Qualifications of the procedure and of the welding operations and welders shall be as specified in American Welding Society, AWS D10.9-80, "Specification for Qualification of Welding Procedures and Welders for Pipe and Tubing"; ANSI B31.1 and ASME Boiler Code, Section IX.
    - a. The contractor shall provide certification in writing that the operator or welder has met the above prescribed standard. The Owner reserves the right to radiographically test a minimum of 5% of welds.
  6. NATURAL GAS LINE PRESSURE REGULATORS
    - a. Regulators shall be lever type equal to Maxitrol and shall be rated for the inlet pressure indicated on the bid drawings. (e.g. for 2 psi inlet pressure the regulator shall be equal to Maxitrol 325-L Series.) Size shall be as required to deliver the capacity shown on the bid drawings. Regulators shall comply with CSA 6.3:19/ANSI Z21.18:19. Contractor shall confirm inlet gas pressure before submitting regulator and shall provide a low pressure regulator for the building gas appliances and a high pressure regulator for the Generator.

#### F. HANGERS AND SUPPORTS

1. Pipe hangers shall conform to MSS SP 58 and SP 69. Pipe hangers for piping 4 inch and larger shall have rolls either of the Harvard type or 2 rod type. Pipe hangers for 3 inch pipe and under shall be clevis type. Pipe hangers for pipe less than 2 inch may be 1A band type in lieu of clevis type. Hangers in contact with copper tubing shall be copper plated.
2. All hangers on insulated piping shall be sized to fit the outside of the covering. Provide spacer blocks and 16 gauge galvanized protection shields (12 inches long) at hangers, when pipe is installed.
3. All hanger rods shall be hung from wood frame ceiling structure using wood screws designed for use with threaded rod adapters, or through-bolted with double nuts and flat washers.
4. Where support points are required to avoid other Work, provide a system of channels and angles between support points as required. Provide all necessary

supports and cross framing. No part of piping, ductwork, equipment, and the building shall be stressed beyond its normal allowable working strength.

5. As applicable, gas piping on the roof shall be set on rubber pipe supports as manufactured by "The Rubber Triangle Co." or an approved equal.

#### G. SLEEVES AND PENETRATIONS

1. Sleeves in Masonry and Concrete Walls, Floors, Ceilings and Flat Roofs: Standard Weight hot-dip galvanized steel, ductile-iron or cast-iron pipe sleeves.
2. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.
3. Duct Sleeves and Openings
  - i. Sleeves through floors, decks, and exterior structure shall be Schedule 40 galvanized steel pipe for round duct.
4. Materials for prepared openings in partitions shall match construction penetrated.
5. Pipe Sleeve Packing
  - i. Packing for sleeves that do not require maintenance of fire rating shall be oakum, silicate foam, ceramic fibre or mineral fibre with approved sealant. Pack or foam to within 1" of both wall surfaces. Seal penetration packing with approved caulking and paintable water-proof mastic surface finish or silicone caulking.
  - ii. All materials must be installed in accordance with manufacturers instructions; all gaps must be sealed. Finish caulk flush with wall or slab surface if piping runs exposed.
6. Pipe penetrations through floors and exterior walls shall be sleeved and sealed using Thunderline Link-Seal wall sleeves and seals or approved equal.
7. Provide escutcheons at all exposed pipe penetrations in finished areas. Escutcheons shall be chrome plated, sized to cover the sleeve, with set screw.

#### H. PLUMBING SPECIALTIES

1. Pressure reducing valves shall be approved equal to Watts Lead Free series 223 sized to match the supply pipe. Reducing valve shall consist of an integral removable stainless steel strainer, nickel alloy seat, and bronze body. Provide a 0-100 psi pressure gauge immediately downstream of the valve.
2. Relief valves (for water heaters) shall be combination pressure/temperature relief valves, AGA rated and ASME labeled.

3. Reduced pressure backflow preventers shall be Watts Series 909, Hersey Beeco, ITT Lawlor, or approved equal bronze body reduced pressure zone back flow type, 175 psi maximum working pressure, complete with replaceable seats, strainer, test cocks, shut off valves, union ends, and air gap fitting. Backflow preventers shall be ASSE, AWWA, and FCCCHR or USC approved.
4. Vacuum breakers: Shall be provided in all domestic water heater cold water inlets, in hose bibb and wall hydrant outlets, and in all other locations specified and as directed by the authority having jurisdiction.
5. Thermal expansion tanks shall be furnished and installed as noted on the plans or in these specifications. Tanks shall be bladder type certified for potable water service and equal to Amtrol.
6. Water hammer arrestors shall be certified per PDI Standard WH-201 and have stainless steel shell and bellows, 250 psi rated as manufactured by Josam, Zurn, J.R. Smith, or approved equal.
7. Provide dielectric couplings at all ferrous to non-ferrous joints.
8. Pressure gauges shall be ASME B 40.1, liquid filled type, 1% accuracy or better, minimum 2 1/2 inch diameter casing, 0 to 100 psig range, with ball valve shutoff and snubber.
9. Furnish, install and connect trap primers to all new floor and trench drains installed as part of this work. Trap primers shall be Precision Plumbing Products Prime-Time Electronic Trap Priming Assembly Model PTS-X series selected for the number of connected drains; or approved equal by Sioux Chief or Watts. Primer unit shall consist of 16 gauge steel enclosure suitable for surface mounting on wall, 120V supply feed, circuit breaker, manual override, test switch, timer, UL listed solenoid valve, anti-siphon atmospheric vacuum breaker, 3/4 inch copper inlet piping, and 1/2 inch or 5/8 inch outlets with compression fittings. Assembly shall supply a minimum of 2 oz of potable water at a factory setting of 6 seconds every 24 hours. Install per manufacturer's requirements and recommendations.

#### I. VALVES

1. Gate Valves 2 inch and Smaller: MSS SP-80, Class 125, with bronze body and integral bronze seat, rising stem, screwed bonnet, solid wedge disk, and threaded ends as manufactured by Jenkins, Crane, Stockham, or approved equal.
2. Ball Valves for water service 2 inch and Smaller: MSS SP-110, 150 psi WSP, with 2 piece bronze body, PTFE seats and seals, full port, blowout proof pressure retaining stem, threaded ends, and vinyl covered carbon steel quarter-turn lever handle. Provide stainless steel ball and stem, with stem extension to accommodate thickness of pipe insulation.

3. Check Valves 2 inch and Smaller: MSS SP-80, Class 150, with bronze body, swing check, thread-in cap, and threaded ends, designed for horizontal or vertical mounting.
4. Gas Valves Underground
  - a. Eccentric Plug Valves shall be rated at 175 psig WOG and shall be UL listed for natural gas service. Valves shall be constructed with ductile iron body, ductile iron plug with resilient seals. Body end connections shall be screwed for sizes 1 inch and smaller and flanged for sizes 1-1/4 inch and larger. Valve shall be approved equal to De Zurick. Furnish and install curb stops and curb box hardware to allow valve operator access from at grade.
5. Gas Valves Interior
  - a. Eccentric Plug Valves shall be rated at 175 psig WOG and shall be UL listed for natural gas service. Valves shall be constructed with semi steel body, bronze plug with Buna-N resilient elastomer seals and plastic coated body sealing faces. Body end connections shall be screwed for sizes 1 inch and smaller and flanged for sizes 1-1/4 inch and larger.
  - b. Ball valves shall be the fire-seal type, conforming to UL 842 and UL 125. Valves shall be full port type rated for service at not less than 400 psi at 200 deg F. Valves shall be suitable for flow from either direction and shall seal tightly in either direction. Valve bodies in sizes 1 inch diameter and smaller shall be screwed-end type constructed of carbon steel, cast steel or ductile iron. Valve bodies in sizes 1-1/4 inch diameter and larger shall be flanged-end type constructed of carbon steel, cast steel or ductile iron unless otherwise specified. When welded valves are specified, valve ends shall be socket weld up to 1-1/2 inch diameter and shall be butt weld for valves 2 inches in diameter or larger. Balls and stems shall be Type 316 corrosion-resistant steel. Valve seats shall be tetrafluoroethylene; seats shall have secondary corrosion-resistant steel seating surfaces to effect shutoff should resin be burned out.

#### J. THERMOSTATIC MIXING VALVE

1. Mixing valves shall be Leonard TM-800-LF self-contained, thermostatic type with dial thermometer on inlet. Mixing valves by Lawler or Taco may be submitted subject to review and approval as equal.

#### K. PLUMBING FIXTURES

1. Emergency Eye Wash/Drench Hose Unit (P-1)
  - i. Furnish and install fixtures by Guardian, Speakman, Encon, or approved equal. Fixture shall be equal to Guardian model G5026 combination Eyewash/Drench Hose wall mounted unit. Unit shall be complete with 3/8 inch by 8 foot long reinforced PVC hose with a 3/8" NPT swivel inlet, forged brass squeeze valve with stainless steel lever handle, in-line vacuum

- breaker between valve and spray head, ABS spray heads mounted side by side, and wall bracket with spring clips. Unit shall comply with ANSI Z358.1-2014 as both an eyewash and a drench hose.
  - ii. Squeeze valve shall be capable of supplying at least 20 gpm at full flow.
  - iii. Furnish and install flow switch in supply piping. Flow switch shall be equal to Guardian Model AP275-615 and shall activate at 0.4 gpm flow.
  - iv. Furnish and mount ANSI-compliant identification sign on wall adjacent to unit.
2. Water Closet Wall Mounted (P-2)
- i. Sloan, American Standard, Kohler, or approved equal. Sloan Model ST-2459 1.6 GPF with Sloan 111 Flushometer Manual Operated Flush Valve. Church open front toilet seat. Wall Carrier by J.R. Smith or approved equal. NOTE: Wall carrier for individual as well as back to back water closet installation shall be no greater than 10 inches in depth to fit within plumbing chase.
3. Wall Mounted Lavatory (P-3)
- i. Sloan, American Standard, Kohler, Crane, or approved equal. Sloan Wall Hung Lavatory with 4-inch centerset faucet holes. Model number SS-3003. With 1-1/4" trap, grid drain and stops. Lavatory carrier by J.R. Smith or approved equal.
  - ii. Just JGN-4 Bar/Laundry Sink Faucet 4" centers with 4" wrist blade handles. Faucets by Chicago Faucet, Brasstech, Kohler or an approved equal.
  - iii. Point of use thermostatic mixing valve shall be approved equal to Sloan MIX-70-A.
4. Mop Sink (P-4)
- i. Mop Service Basin: Fiat, Crane, Guy Gray or approved equal. Basis of design is Fiat MSB 2424 molded stone floor sink.
  - ii. Faucet is Fiat Service Sink Faucet Model 830-AA wall mounted faucet on 8 inch center, with chrome plated brass body, support bracket, vacuum breaker, 3/4" threaded hose outlet, bucket hook and handles.
  - iii. Point of use thermostatic mixing valve shall be approved equal to Sloan MIX-70-A.
5. Metal Ice Maker Box (P-5)
- i. Oatey Efield, IPS or approved equal. Basis of design is Oatey Metal Ice Maker Box with 20 gauge steel box suitable for surface mounting, 28 gauge steel face plate, water hammer arrester, 1/4" brass ball valve. Comply with ASSE Standard 1010 and ASME A112.18.1.
6. Acid Waste Neutralization System for Lab Sink (Sink by Others)
- i. Acid Waste: Spears Acid Neutralization Tank consists of a High Density Polyethylene body with 2" mpt fitting top inlet, side outlet, side vent outlets, removeable bolted flange top assembly, and 5 gallon sediment collection chamber. Furnish 100 lbs of limestone chips for multiple fills of the tank and provide an initial fill of the tank when the installation has been completed.
7. Hose Bibb (HB)
- ii. Hose Bibbs shall be equal to Woodford B67 series 1/2 inch size X 3/4" garden hose connection, polycarbonate or metallic handle, female 1/2" NPT

inlet with wall mounting flange and lockable door, male hose thread outlet complete with bronze vacuum breaker. Hose bibb shall have rough chrome finish. Support hose bibb supply pipe 3" max above mounting height of hose bib.

8. Nonfreeze Wall Hydrant (WH)

- i. Wall Hydrant shall be equal to Woodford B24P; ASSE 1011, cast bronze, with aluminum wall box, lock shield and handwheel, 3/4" male IPS inlet, 3/4" inch external hose thread outlet with automatic draining vacuum breaker. Hydrant shall be of sufficient length to extend through walls and place the valve seat inside the building. Bonnet and valve stem shall be removable from outside of the building. Wall hydrant shall be installed so that water can drain to the exterior when valve is closed.

9. Floor Drain

- i. Floor Drain FD-A shall be equal to MIFAB Figure 2100-C; Zurn, Josam, or approved equal; with sediment bucket, trap primer connection and ductile iron grate.
- ii. Floor Drain FD-B shall be equal to JR SMITH Figure F100-C-TS; Zurn, Josam, or approved equal; with sediment bucket, trap primer connection and ductile iron grate.
- iii. Floor Drain FD-C shall be equal to JR SMITH 1000-C-S; Zurn, Josam, or approved equal; with sediment bucket, trap primer connection and ductile iron grate.

10. Trench Drain (As Applicable)

- i. Trench Drain TD shall be MIFAB P9002-FL-32 as scheduled or approved equal. Drains shall be furnished with 304 stainless steel grate, anchor flange, frame, no hub center outlet, and trap primer connections. See fixture schedule on Plumbing drawings for manufacturer and model information.

L. PIPING INSULATION

- 1. All insulation, adhesives, tape, etc. shall be as specified herein.
- 2. Insulation materials and thickness shall be as noted in Tables 1 and 2 below:

TABLE 1  
INSULATION MATERIAL FOR PIPING

Service	Material	Spec	Type	Class	Vapor Barrier Required
Plumbing Domestic Hot Water and Tempered Water	Mineral Fiber	ASTM C 547	II	1	No
	Cellular Glass	ASTM C 552		2	No
	Urethane	ASTM C 59/ C 59M1	III		Yes
	Faced Phenolic Foam	ASTM C 1126			Yes
Plumbing Domestic Cold Water Piping	Mineral Fiber	ASTM C 547	II	1	Yes
	Cellular Glass	ASTM C 552		2	No
	Urethane	ASTM C 59/C 59 M1			Yes

Service	Material	Spec	Type	Class	Vapor Barrier Required
	Flexible Cellular	ASTM C 534	I		No

TABLE 2  
PIPING INSULATION THICKNESS (INCH)

Service	Material	Tube and Pipe Size (Inches)		
		< 1	1 < 1-1/2	1½ -4
Plumbing Domestic Hot Water and Tempered Water	Mineral Fiber	1	1	1.5
	Cellular Glass	1	1	1.5
	Urethane	1	1	1.5
	Faced Phenolic Foam	1	1	1.5
Plumbing Domestic Cold Water Piping and Service Water Piping	Mineral Fiber	0.75	1	1.5
	Cellular Glass	0.75	1	1.5
	Flexible Cellular	0.75	1	1.5
	Urethane	0.75	1	1.5
	Faced Phenolic Foam	0.75	1	1.5

- i. Insulation and vapor barrier adhesive shall comply with ASTM C916.
- ii. Cover water supplies and drains from lavatory and sinks with insulated protective jacketing equal to Truebro LavGuard.

#### M. TANKLESS GAS FIRED WATER HEATER

1. Tankless domestic water heaters shall be Noritz, Bradford-White, Rinnai, or approved equal, ANSI Z21.10.3 or ASME approved, wall-mounted, gas-fired, self-regulating instantaneous type with capacities as indicated on Contract Drawings. Units shall be designed for indoor installation and designed for operation between 50 and 80 psig water pressure.
2. Units shall include modulating gas burner and variable speed combustion air blower. Heat exchanger shall be multi-pass design and provided with anti-freeze heaters for protection in cold climate conditions.
3. Units shall have direct vent exhaust with coaxial combustion air supply pipe and fittings, concentric vent/intake air termination kit, and condensate collector furnished by the water heater manufacturer.
4. Controls shall be fully automatic. Primary control shall be integrated into the face of the water heater unit. Units shall be equipped with built-in sensor for monitoring outgoing water temperature (100 to 160 degrees F minimum setpoint range); water flow control consisting of water flow sensor, microprocessor controlled water flow solenoid, and bypass solenoid; lime accumulation sensor built into heat exchanger to alert of build-up; flame rod sensor to indicate flame

failure; boiling protection consisting of lockout thermistor and combustion fan rpm check; and direct electronic spark ignition. Diagnostic controls shall be provided to display fault codes. An electronic manifold controller designed for multiple water heater installations shall be furnished by the water heater manufacturer.

5. The burner and combustion air blower shall modulate between minimum and maximum input to maintain outgoing water temperature setpoint. If the temperature of the water exceeds the setpoint temperature by a pre-determined factory set amount, the burner shall shut down. The burner shall ignite once outgoing water temperature falls below the setpoint. Units shall only run when there is a demand for hot water.
6. Furnish and install 2 gallon bladder type expansion tank as part of the hot water system. Tank shall be by Amtrol or approved equal.

#### N. GAS VENT AND COMBUSTION AIR

1. Furnish and install gas vent and combustion air systems from all the gas fired appliances, including the Tankless Gas Fired Water Heater, Gas Fired Unit Heaters and the Makeup Air Unit as shown on the Contract Drawings. These specifications shall apply to all categories of appliances. This includes combustion air inlets and gas vent discharge.
2. The vent system shall consist of all items which form a part of the assembly standard tee sections, straight sections, elbows, support and bird proof terminal to provide a complete and approved system. All vent parts exposed to the weather shall be stainless steel.
3. Installation shall be made in accordance with the manufacturer's recommendations and in compliance with the Massachusetts Fuel Gas Code. Minimum clearance to combustible materials shall be as required by the heating equipment manufacturer but in no case less than 4 inches.
4. The vent shall be of the double-wall, factory-built type for use on condensing appliances or pressurized venting systems serving Category II, III or IV appliances or as specified by the equipment manufacturer.
5. Vent shall be constructed with an inner and outer wall, with a 1" annular insulating air space. Vent shall be constructed of AL29-4C, and listed to UL1738; .015 thickness for 3"-12" diameters. Outer casing shall be constructed of aluminized steel, type 430 stainless steel of .018 thickness for 3" to 12" diameters. PVC and CPVC pipe are not acceptable.
6. Combustion air shall consist of 304 stainless steel pipe.
7. All supports, wall penetrations, terminations, appliance connectors and drain fittings, required to install the vent system shall be stainless steel. Support vent from building structure using rigid structural shapes for attachment of fixed point

supports (Plate Support assembly). Anchor supports to structure by welding, bolting, steel expansion anchors, or concrete inserts. Size of structural shapes shall be in accordance with manufacturer's recommendations.

8. The Combustion Air and Vent system shall connect to the equipment and to a supply concentric vent kit for each piece of equipment. Supply and concentric vent kits shall be furnished by the HVAC FSB contractor to the Plumbing FSB contractor for installation.

#### O. ELECTRIC WATER HEATER

1. EWH-1: Water heater shall be model EX4208T, manufactured by EEMAX, having electrical input of 4.1 KW, 208 VAC, 1 phase, 60 hz, 0.3 gpm activation rate and a 28°F temperature rise at 1 gpm flow rate. Heater shall have a working pressure rating of 150 psi and shall be completely assembled. Water heater shall be equipped with replaceable inlet filter, adjustable thermostat, replaceable nichrome cartridge insert, and high temperature limit switch. Water heater shall be covered by a five-year limited warranty against tank leaks.

#### P. DOMESTIC HOT WATER RECIRCULATION PUMP

1. Furnish, install and wire an aquastat equal to Honeywell L4006A. Aquastat shall clamp to recirculation line and the aquastat contacts shall cycle the recirculation pump to maintain a recirculation setpoint of 100 deg F. (adjustable)
2. Furnish and install a domestic hot water recirculation pump equal to Taco 006 IFC with an integral flow check valve.. Pump shall comply with NSF 61.

#### Q. PORTABLE SUMP PUMP

1. Furnish a sump pump equal to Liberty Model 230. Pump shall consist of a 1/3 hp 120VAC motor, 10-foot power cord, polypropylene and aluminum construction, stainless steel shaft, manual switch, 1-1/2" discharge and capable of handling 3/8" solids. Provide to Owner for his use.
2. Furnish an 1-1/2" by 3/4" threaded adapter with end connection compatible with the sump pump for hose by Owner.

### PART 3 - EXECUTION

#### 3.1 INSTALLATION

- A. The responsibility for determining the exact size and location of openings is part of the Work of this section. If this responsibility is not met, cutting and patching to achieve the correct size and location of openings and chases is part of the Work of this section.
- B. Masonry Contractor shall handle interior openings, including all cutting and patching required for the Work of the section. Cutting and patching of masonry walls, partitions, ceilings and floors is included. Concrete cutting shall be done with abrasive wheels or saws, and coring with a diamond core bit. The use of jackhammers is prohibited.

C. Equipment shall be installed in strict accordance with manufacturer's instructions, unless otherwise specified herein, or on the Contract Drawings. In case of discrepancies, contact the Engineer for instructions.

D. INSTALLATION OF DOMESTIC WATER PIPING

1. Provide a shutoff valve on each pressure piping connection at each item of equipment, except vent and overflow connections.
2. Do not install valves with the stem below horizontal.
3. Provide a union or flange at each connection at each item of equipment.
4. Install piping parallel to or perpendicular to the lines of the building.
5. Pitch all pressurized water piping up 1 inch in 80 feet, or run dead level and provide an air vent every 40 feet.

## E. INSTALLATION OF NATURAL GAS PIPING

1. General: Install natural gas piping as shown on the drawings in accordance with the Massachusetts Fuel Gas Code 248 CMR 4.00 as follows:
2. AS APPLICABLE:
  - a. Exterior gas piping shall have a backfill cover of 30 inches and shall be a minimum of 3 feet from other structures such as other site piping. All exterior gas piping shall have a detectable warning tape installed at 6 inches above the pipe for its entire buried length.
  - b. Connections between metallic and plastic piping shall be made only underground, exterior and with an approved transition fitting.
3. The connection to the gas meter outside the building shall be in accordance with local gas utility requirements and the applicable codes. Gas piping shall begin at the outlet of the regulator and shall run to the connection at all gas-fired equipment. The gas supply pipe shall be of the size indicated on the drawings.
4. Caulk spaces watertight between pipes and sleeves passing through exterior walls, slabs on grade and over crawl spaces, and waterproofed floors. Pack and seal spaces between pipes and sleeves passing through floors, walls, and ceilings of machine spaces, such as mechanical equipment, refrigeration, boiler, pump, fan, and machinery rooms at both ends of sleeve to provide an airtight acoustical barrier.
5. Where concealed piping is indicated, it shall be installed in a location to permit access to the piping with a minimum amount of damage to the building.
6. Underground gas piping shall be installed in compliance with Department of Transportation regulations, as applicable.
7. Joints shall be made with graphite and oil or an approved graphite compound applied to the male thread only. After cutting, and before threading, pipe shall be reamed and all burrs shall be removed. Threads shall be accurately cut, and not more than three threads shall remain exposed outside each fitting after the joint has been made up. Each length of pipe shall be hammered and all scale shall be blown out before assembling. Threaded joints shall not be caulked to prevent or stop leaks.
8. Piping shall be graded not less than 1 inch in 40 feet of length to prevent trapping. The gas supply pipe from the main in the street to the meter shall grade up toward the meter. Horizontal lines from the meter to the risers shall grade down toward the risers and branches from risers to appliances shall grade up toward the risers and branches from risers to appliances shall grade up toward the appliances.

9. Uncovered, exposed pipes shall be provided with plates at the point where they pass through floors, finished walls, and finished ceilings. Where necessary to cover beads of fittings, special deep escutcheons shall be provided in lieu of plates. Plates shall be not less than 0.018-inch thick. Wall and ceiling plates shall be secured with round head set screws, not with spring clips. Unless otherwise specified, plates shall be of the one-piece type. Wall and ceiling plates may be flat hinged pattern.
10. A full size tee fitting and a 6 inch long capped drip pocket shall be installed at the bottom of each riser or drop and at each low point in a horizontal gas line.
11. Gas Valves inside the building: Provide and install gas valves at connection to gas train for each gas fired equipment item; at the base of each riser, at branches and as indicated on the drawings. Locate gas valves where easily accessible and where they will be protected from possible injury. Provide plugged or capped outlets for future extensions or connections as indicated on the drawings.
12. Pressure Regulating Valves: Install pressure regulating valves in accordance with local utility company's requirements and manufacturers installation instructions. Install gas shutoff valve upstream of each pressure regulating valve.
13. Equipment Connections: Connect gas piping to each gas fired equipment item, with drip leg (in heated spaces) and shutoff gas valve. Comply with equipment manufacturer's instructions. Drip legs shall not be installed on the exterior of the building.
14. Testing:
  - i. Inspect, test, and purge natural gas systems in accordance with local and Commonwealth code requirements, NFPA 54 requirements and as follows.
  - ii. Visually examine natural gas system after installation.
  - iii. Pressure test natural gas system with dry air or nitrogen at 100 psig for 2 hours. Soap test all joints to detect leaks.
  - iv. Flush and purge natural gas system and charge with gas in accordance with local utility requirements and NFPA 54.

## F. INSULATION

1. Application - General
  - i. Installation
    - a) Except as otherwise specified, material shall be installed in accordance with the manufacturer's written instructions. Insulation materials shall not be applied until tests specified in other sections of the Specifications are completed. Material such as rust, scale, dirt and moisture shall be

removed from surfaces to receive insulation. Insulation shall be kept clean and dry. Insulation shall not be removed from its shipping containers until the day it is ready to use and shall be returned to like containers or equally protected from dirt and moisture at the end of each workday. Insulation that becomes dirty shall be thoroughly cleaned prior to use. If insulation becomes wet or if aforementioned cleaning does not restore the surfaces to like new condition, the insulation may be rejected, and if rejected, shall be immediately removed from the jobsite. Joints shall be staggered on multilayer insulation.

2. Pipe insulation shall be as follows:
  - i. Do not insulate the following:
    - a) Unions
    - b) Flexible connectors
3. Pipe insulation shall be continuous and installed on fittings and appurtenances unless specified otherwise. Installation shall be with full length units of insulation and using a single cut piece to complete a run. Cut pieces or scraps abutting each other shall not be used.
4. Insulation (Except Flexible Cellular and Calcium Silicate Insulation):
  - i. Place sections of insulation around pipe and joints tightly butted into place. Draw jacket tight and smooth. Secure jacket with fire resistant adhesive, factory-applied self-sealing lap, or stainless steel outward clinching staples spaced not over 4 inches on center and 1/2 inch minimum from edge of lap. Cover circumferential joints with butt strips, not less than 3 inches wide, of material identical to jacket material. Overlap longitudinal laps of jacket material not less than 1 1/2 inches. Adhesive used to secure butt strip shall be same as that used to secure jacket laps. Apply staples to both edges of butt strips.
  - ii. Vapor Barrier Jacket: When a vapor barrier jacket is required, as indicated in Table 1, on ends of sections of insulation that butt against flanges, unions, valves, fittings, and joints, provide a vapor barrier coating or manufacturer's weatherproof coating for outside service unless pipe is supplied with factory-applied self-seal lap. Apply vapor barrier coating at longitudinal and circumferential laps. Patch damaged jacket material by wrapping a strip of jacket material around the pipe and cementing, stapling, and coating as specified for butt strips. Extend patch not less than 1 1/2 inches past the break in both directions. At penetrations by pressure gages, thermometers, etc. fill voids with vapor barrier coating for outside service. Seal with a brush coat of the same coating.
  - iii. Metal Covers: Provide metal covers on insulated piping that is within 6 feet of the finished floor. Secure covers with ss banding.

## 5. Flexible Cellular Insulation

- i. Flexible cellular pipe insulation shall be tubular form. Sweat fittings shall be insulated with miter cut pieces the same size as on adjacent piping.
- ii. Bond cuts, butt joints, ends, and longitudinal joints with adhesive. Miter 90-degree turns and elbows, tees, and valve insulation. Provide mineral-fiber insulation inserts and sheet-metal sleeves. Insulate flanges, unions, valves, and fittings in accordance with manufacturer's published instructions. Apply two coats of finish as recommended by insulation manufacturer to flexible unicellular insulation in outside locations. Do not use vinyl lacquer finish or equivalent. Provide flexible cellular insulation for outdoor use with ultraviolet (UV) resistant coating.

## 6. Cellular Glass and Calcium Silicate Insulation

- i. Provide in accordance with manufacturer's printed instructions.

## 7. Hangers and Anchors

- i. Insulation, whether hot or cold application, shall be continuous through hangers. All horizontal pipes 2 inches and smaller shall be supported on hangers with the addition of a Type 40 protection shield to protect the insulation in accordance with MSS SP-69 whenever insulation shows signs of being compressed, or when the insulation or jacket shows visible signs of distortion at or near the support shield, insulation inserts as specified below for piping larger than 2 inches shall be installed. Where pipe is supported by insulation, provide galvanized steel shields or protection saddles.
- ii. Where shields are used on pipes 2 inches and larger, provide insulation inserts at points of hangers and supports. Insulation inserts shall be of calcium silicate, cellular glass, molded glass fiber, all minimum 8 pounds per cubic foot, or other approved material of the same thickness as adjacent insulation. Insulation inserts shall cover bottom half of pipe circumference and be not less in length than the protection shield. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating or weatherproof coating as applicable.
- iii. Where protection saddles are used, fill voids with same insulation material as used on adjacent pipe. Protection saddles shall not be used on piping carrying medium less than 60 degrees F.
- iv. Where anchors are secured to piping carrying medium less than 60 degrees F that is to be insulated, insulate anchors same as piping for a distance not less than four times the insulation thickness to prevent condensation. Vapor seal insulation around anchors.
- v. Inserts shall be covered with a jacket material of the same appearance and quality as the adjoining pipe insulation jacket, shall overlap the adjoining pipe

jacket 1-1/2 inches, and shall be sealed as required for the pipe jacket. The jacket material used to cover inserts in flexible cellular insulation shall conform to ASTM C 921, Type 1, and is allowed to be of a different material than the adjoining insulation material.

#### 8. Sleeves and Wall Chases

- i. Where interior wall is penetrated, extend aluminum jacket 2 inches out on either side of wall and secure on each end with a band. Where floor is penetrated, extend a aluminum jacket from a point below back-up material to a point 10 inches above floor with one band at the floor and one not more than one inch from end of metal jacket. Where exterior wall is penetrated, extend aluminum jacket through sleeve to a point 2 inches beyond interior surface of wall.
- ii. Pipe insulation shall be continuous through the sleeves.
- iii. An aluminum jacket with factory applied moisture barrier shall be provided over the insulation wherever penetrations require sealing.

#### 9. Flanges, Unions, Valves and Fittings for Piping

- i. Factory fabricated removable and reusable insulation covers may be used except with flexible cellular insulation. When nesting size insulation is used, overlap 2 inches or one pipe diameter, whichever is larger. Use insulating cement to fill voids. On pipe sizes larger than 2-1/2 inches, elbow insulated using segments shall not have less than three segments per elbow. Place and join segments with manufacturer's recommended water-vapor resistant, fire retardant adhesive appropriate for the temperature limit of the service. Overlap tape seams one inch. Total dry film thickness shall be not less than 1/16 inch. Unions are not to be insulated; taper insulation to union at a 45 degree angle. Provide finish coating as follows:
  - a) Coating with Embedded Glass Tape: Coat insulation and all purpose jacket with two coats of lagging adhesive and with glass tape embedded between coats. Total dry film thickness shall not be less than 1/16 inch. For cold piping, seal insulation and jacket with two coats of vapor barrier coating with glass tape embedded between coats. Insulate anchors attached directly to cold pipe for a sufficient distance to prevent condensation but not less than 6 inches from insulation surface.
  - b) PVC Fitting Covers: Factory premolded one-piece PVC fitting covers may be provided in lieu of two coats of adhesive with tape embedded between coats. Provide factory premolded field-fabricated segment or blanket insert insulation under fitting covers. Install factory premolded one-piece PVC fitting covers over insulation. Secure covers with stapling, taping with PVC vapor barrier tape, or with metal or plastic tacks made for securing PVC fitting covers. Do not provide PVC fitting covers where exposed to weather. Provide PVC fitting covers only in ambient temperatures below 150 degrees F.

## 3.2 CLEANING, TESTING AND STARTUP

### A. CLEANING

1. Clean all debris resulting from the work of the section, and remove it from the Project Site, daily.
2. Close pipe openings with caps or plugs during installation. Tightly cover and protect fixtures and equipment against dirt, water and chemical or mechanical injury. At completion of all Work, thoroughly clean all fixtures, exposed materials and equipment.

### B. TESTS

1. Test water piping at 100 psi hydrostatic pressure before any covering is installed. Blank off or remove items which may be damaged by the test pressure. Correct all defects and retest as many times as is necessary to verify that all defects have been remedied. Neither peening nor the use of leak seals is permitted.
2. Test drain-waste piping by tightly plugging all openings except for the highest opening in the system. Fill all systems to overflowing. Systems shall be tight throughout with no drop in water level for a minimum period of 2 hours.

### C. DISINFECTION OF WATER SUPPLY SYSTEM

1. Fill all systems with a water and chlorine solution which contains 50 parts per million of available chlorine and allow it to stand 6 hours before flushing. Fill each system with a solution which contains 100 parts per million of available chlorine; allow it to stand 2 hours and flush it.

### D. TAGS

1. Upon completion of work, attach engraved laminated tags to all valves (listed in the valve directory called for in the "Bulletins, Manuals and Instructions" paragraph of these specifications) and all pieces of HVAC equipment (including but not limited to pumps, fans, air handlers, coils and all other equipment listed in the HVAC schedules). Valve tags shall have black characters on white face, consecutively numbered and prefixed by letter "V". Equipment tags shall have black characters on white face, with labels corresponding to drawing schedule numbers.
2. Embossed or engraved aluminum or brass tags may be substituted if desired. Tags shall be at least 1/8" thick.
3. Valve tags shall be at least 1" in diameter with numerals at least 3/8" high and attached by "S" hooks or chains. Equipment tags shall be at least 2" diameter securely attached to apparatus.

4. Provide manufacturers equipment nameplates, catalog numbers and rating identification securely attached to electrical and mechanical equipment with screws or rivets. Adhesives or cements will not be permitted.

**E. PIPE IDENTIFICATION**

1. Provide color-coded pipe identification markers on piping installed under this Section. Pipe markers shall be snap-on laminated plastic protected by clear acrylic coating. Pipe markers shall be applied after architectural painting where such is required.
2. Provide arrow marker with each pipe content marker to indicate direction of flow. If flow can be in either direction, use double-headed arrow marker.
3. Mains shall be labeled at points of entrance and exit from mechanical room, adjacent to each valve, on each riser, at each tee fitting, at points of entrance and exit from building, at least once in each room, and at intervals no longer than 20 ft.
4. Location of pipe markers, size of legend letters on markers and length of color field shall be per the latest edition of ANSI A13.1.
5. Markers shall be "Setmark" by Seton Name Plate Corp. or approved equal.
6. Following color coding shall be used with names in black letters on background and white letters on green background.

<b>Service</b>	<b>Legend</b>	<b>Background Color</b>
Domestic Hot Water Supply	DHWS	Green
Domestic Hot Water Return	DHWR	Green
Fuel Gas	FG	Yellow
Domestic Cold Water	CW	Green
Condensate	Condensate	Yellow
Non-Potable Cold Water	NPCW	Green
Tempered Water	TW	Green

7. Color banding shall meet latest edition of ANSI A13.1 and OSHA.

## F. PAINTING

1. Clean all surfaces free of dirt, oil, grease, etc. Surfaces shall be clean and dry before any paint is applied.
2. Restore to original condition and appearance any equipment which has sustained damage to the manufacturer's prime and/or finish coat.

### 3.3 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.
- B. Operation and Maintenance Manuals - Prepare manuals in accordance with Section 01730.
- C. Instruct Owner's operating personnel, during consecutive working days, in the operation and maintenance of the systems and equipment, to the written satisfaction of the Owner.
- D. Record drawings shall be provided by the Plumbing FSB as specified in Section 00700 - General Conditions and section 01170 - Special Provisions.

END OF SECTION 15400

## SECTION 15500

### HEATING, VENTILATION AND AIR CONDITIONING (Part of Filed Sub-Bid Section 15002 HEATING, VENTILATION AND AIR CONDITIONING - Filed Sub Bid Required)

#### PART 1 GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The Work covered under this Section of the Specifications includes the following:

- 1. 15900 – Laboratory Fume Hoods

- B. Related Sections include the following:

- 1. Division 0 – Bidding and Contract Requirements

- 2. Division 1 – General Requirements

- C. Work included:

- 1. The HVAC FSB shall be responsible for the following:

- i. Coordination drawings.

- ii. Heating system consisting of electric unit heaters, and gas fired unit heaters.

- iii. De-humidification system for the Filter Room with remote condensers for summer cooling.

- iv. Heat pump system for the Control Room and Break Room/Kitchen.

- v. Supply and exhaust ventilation systems including Fume Hood, and ductwork and accessories for Fume Hood, Makeup Air Unit, and Exhaust Fans.

- vi. Concentric Vent kits for Gas Fired Unit Heaters, and Makeup Air Unit. HVAC FSB shall furnish vent kits to Plumbing FSB for installation in the gas vent systems.

- vii. Make Up Air Unit for Control Room

- viii. Automatic controls.

- ix. HVAC work for Well 3 and Well 4 as shown on Bid Drawing H-9 and per equipment schedules on Bid Drawing H-10.

- ix. Testing, adjusting, balancing and commissioning.

- x. Duct Smoke Detectors – furnished by Division 16, installed by Division 15.

- D. Work not included:

- 1. Section 03300 - Cast-In-Place Concrete.

2. Section 05500 - Metal Fabrications except supplementary steel for supports and attachments.
3. Section 09900 - Painting and Coatings.
4. Section 10200 - Fixed Louvers.
5. Section 12350 - Laboratory Casework. (Coordination is required.)
6. Section 15195 – Liquified Petroleum Gas Piping System
7. Section 15400 - Plumbing.
8. Section 16085 - Miscellaneous Equipment.
9. Section 16120 - Wire And Cables.
10. Section 16443 - Motor Control Centers
11. Interior openings to be handled by the Masonry FSB.

### 1.3 SUBMITTALS

- A. Shop drawings and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 00700 - General Conditions and Section 01300 - Submittals.
- B. Provide submittals for the following items consisting of manufacturer's published data. All submittals shall show compliance with the referenced specification.
  1. Heat Pump System
  2. Hangers and supports
  3. Refrigerant piping and accessories
  4. Air-cooled condenser – remote mounted
  5. Dehumidification units
  6. Electric unit heaters
  7. Gas fired unit heaters
  8. Electric Wall Heaters
  8. Make Up Air Unit
  9. Fans
  10. Ductwork
  11. Ductwork accessories

12. Duct and Pipe Insulation
13. Gas Fired Equipment Concentric Vents (Gas Fired Unit Heaters, and Makeup Air Unit).
13. Refrigerant Detector
14. Automatic controls

#### 1.4 COORDINATION DRAWINGS

- A. The HVAC FSB shall prepare a complete set of AutoCAD format floor plans and sections background drawings at a scale not less than 3/8" equals 1' 0", showing structure and other information as needed for coordination. These will be the Coordination Drawings.
- B. Each of the below specialty trades shall add its work to these background drawings in different colors and layers with appropriate elevations and grid dimensions. Specialty trade information is required for all areas. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.
  1. HVAC Systems and all sheet metal work.
  2. Plumbing Systems.
  3. Fire Protection Systems.
  4. Electrical System including light locations.
- C. Where conflicts occur with placement of materials of various trades, the HVAC FSB will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade.
- D. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- E. The HVAC FSB shall make AutoCAD electronic file of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Architect/Engineer and have been reviewed.
- F. Review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.
- G. The HVAC FSB shall provide the following distribution of documents:
  1. Electronic file of the Coordination Drawings to each specialty trade and affected Subcontractor for their use.

2. Electronic file of the Coordination Drawings to the Engineer.
3. Electronic file of the Coordination Drawings to General Contractor.

H. Coordination Drawings include but are not necessarily limited to:

1. Structure.
2. Partition/room layout.
3. Ceiling tile and grid.
4. Light fixtures.
5. Access panels.
6. Sheet metal, grilles, diffusers, etc
7. Domestic water, gas, soil, waste and vent piping and associated valves.
8. Electrical conduit runs above 2” and electrical equipment.
9. Sprinkler piping, heads and mounting brackets.

## 1.5 QUALITY ASSURANCE

A. Perform work strictly as required by rules, regulations, standards, codes, ordinances, and laws of local, state, and Federal governments, and other authorities that have legal jurisdiction over the site. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:

1. Local and state building, plumbing, mechanical, electrical, fire and health department codes.
2. State Plumbing Board Accepted Products.
3. Massachusetts 528 CMR Bureau of Pipe Fitters & Refrigeration Technicians
4. American Gas Association (AGA).
5. National Fire Protection Association (NFPA).
6. American Insurance Association (A.I.A.) (formerly National Board of Fire Underwriters).
7. Occupational Safety and Health Act (OSHA).
8. Factory Mutual Association (FM).
9. Underwriters' Laboratories (UL).

- B. Material and equipment shall be listed by Underwriters' Laboratories (UL), and approved by ASME and AGA for intended service.
- C. When requirements cited in this Specification conflict with each other or with Contract Documents, most stringent shall govern work. Engineer may relax this requirement when such relaxation does not violate ruling of authorities that have jurisdiction. Approval for such relaxation shall be obtained in writing.
- D. Most recent editions of applicable specifications and publications of the following organizations form part of Contract Documents:
  - 1. American National Standards Institute (ANSI).
  - 2. American Society of Mechanical Engineers (ASME).
  - 3. National Electric Manufacturers Association (NEMA).
  - 4. American Society for Testing and Materials (ASTM).
  - 5. American Water Works Association (AWWA).
  - 6. American Society for Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
  - 7. Air Moving and Conditioning Association (AMCA).
  - 8. Sheet Metal and Air Conditioning Contractors National Association (SMACNA).
  - 9. American Diffuser Council (ADC).
  - 10. Air Conditioning and Refrigeration Institute (ARI).
  - 11. Thermal Insulation Manufacturers Association (TIMA).
- E. Special attention is directed to requirements of NFPA 45, Laboratories Using Chemicals.

#### 1.6 DELIVERY, STORAGE AND HANDLING

- A. All materials and equipment shall be shipped, stored, handled and installed in such manner as not to degrade quality, serviceability, or appearance.
- B. All manufactured materials shall be delivered to the Project Site in original packages or containers bearing the manufacturer's labels and product identification.
- C. Protect materials against dampness. Store off floors, under cover, and adequately protected from damage.

- D. Deliver products to the Project Site and store and protect same as recommended by the manufacturers'.
- E. Inspect all HVAC equipment and materials, upon receipt at the Project Site, for damage and correctness.
- F. Store all materials and equipment on site in a location approved by the Engineer.
- G. Protect all work, the Owner's property and the property of others from injury or loss caused by operations associated with the Work of this section. Make good any such injury or loss, at no cost to the party suffering the injury or loss. Care and protect for all Work included under this section until it has been tested and accepted.
- H. Protect all equipment and materials from damage from all causes including theft. All materials and equipment damaged or stolen shall be repaired or replaced with equal material or equipment.
- I. Protect all equipment, outlets and openings with temporary plugs, caps and covers. Protect work and materials of other trades from damage that might be caused by work or workmen under this section and make good damage thus caused.

#### 1.7 COORDINATION

- A. Check Contract Drawings as well as Shop Drawings of all trades to verify and coordinate spaces in which Work of this section will be installed.

#### 1.8 DESIGN CRITERIA

- A. The Work of this section shall comply with the requirements of the Massachusetts Building Code and of all other authorities having jurisdiction.
- B. The equipment covered by the Specifications is intended to be standard equipment of proven quality as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practice of the industry and shall operate satisfactorily when installed in accordance with the Contract Documents. The Specifications call attention to certain details, but do not purport to cover all details entering into the construction of the equipment.
- C. All material shall be new and shall bear the manufacturer's full identification.
- D. Requirements of Regulatory Agencies
  - 1. The final, complete installation shall comply with all state and local statutory requirements having jurisdiction. Arrange for all necessary permits, pay all fees and arrange for all required inspections by state and local authorities.
  - 2. In general, all Work shall comply with the requirements of rules, regulations, standards, codes, ordinances, and laws of local, state, and federal governments, and other authorities that have legal jurisdiction over the Project Site. Materials

and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:

- i. Local and state building, HVAC, plumbing, mechanical, electrical, energy, fire and health department codes.
  - ii. American Gas Association (AGA).
  - iii. National Fire Protection Association (NFPA).
  - iv. Occupational Safety and Health Act (OSHA).
  - v. Underwriters' Laboratories (UL).
  - vi. Material and equipment shall be listed by Underwriters' Laboratories (UL), and approved by ASME and AGA for intended service.
3. When requirements cited in the Specifications conflict with each other or with Contract Documents, most stringent shall govern Work.
4. Most recent editions of applicable specifications and publications of the following organizations form part of Contract Documents:
- i. American National Standards Institute (ANSI).
  - ii. American Society of Mechanical Engineers (ASME).
  - iii. National Electric Manufacturers Association (NEMA).
  - iv. American Society for Testing and Materials (ASTM).
  - v. American Society for Heating, Refrigerating and Air Conditioning Engineers (ASHRAE).
  - vi. Air Moving and Conditioning Association (AMCA).
  - vii. Sheet Metal and Air Conditioning Contractors National Association (SMACNA).
  - viii. Air Conditioning and Refrigeration Institute (ARI).
  - ix. Thermal Insulation Manufacturers Association (TIMA).
  - x. Institute of Electrical and Electronics Engineers (IEEE).
  - xi. Insulated Cable Engineers Association (ICEA).

E. Tests, Adjusting and Balancing (TAB)

1. Test all systems furnished under this section and repair or replace all defective Work. Make all necessary adjustments to the systems and instruct the Owner's personnel in the proper operation of all systems.
2. Defined to include, but not necessarily limited to, air distribution systems, and associated equipment and apparatus of mechanical Work. Work consists of setting speed and volume (flow) adjusting facilities provided for systems, recording data, conducting tests, preparing and submitting reports, and recommending modifications to Work as required by the Contract Documents.
3. Startup the following pieces of equipment in strict accordance with manufacturer instructions and with the manufacturer's representative.
  - i. Electric unit heaters.
  - ii. Gas fired unit heaters

- iii. Air-cooled condenser for Dehumidifier.
  - iv. Dehumidification units
  - v. Fans.
  - vi. Makeup Air System
  - vii. Heat Pump System.
4. Submit certified test reports signed by test and balance supervisor performing TAB Work.
  5. Include identification and types of instruments used and most recent calibration date with submission of final test report.
  6. Shop Drawings
    - i. Submit sample test data forms complete with certifying agency logo, identifying required test data, date, page number, system designation, system location, Project name, and balancer's name.
  7. Tester's Qualifications: Firm with at least 3 years successful testing, adjusting, and balancing experience on projects with testing and balancing requirements similar to those required for the Project, not installer of system to be tested, and otherwise independent of the Project.
  8. NEBB or AABC Compliance: Comply with either National Environmental Balancing Bureau (NEBB) or Associated Air Balance Council (AABC) Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems, as applicable to mechanical air distribution systems and associated equipment and apparatus.
  9. Industry Standards: Comply with ASHRAE recommendations pertaining to measurements, instruments, and testing, adjusting, and balancing except as otherwise indicated.
  10. Do not proceed with testing, adjusting, and balancing Work until system complete and operable. Ensure no later residual Work still to be completed.
  11. Do not proceed until Work scheduled for testing, adjusting, and balancing clean and free from debris, dirt, and discarded building materials.
  12. The Engineer shall be immediately notified of any unfavorable test results or indication of faulty equipment. No piece of equipment shall be energized until the test data is evaluated and the equipment is proven acceptable.
  13. Upon completion of the work herein described, the Testing Firm shall submit Test and Inspection Reports to the Engineer.
  14. If the test and inspection data submitted should indicate deficiencies in the operation of the electrical apparatus or in the manufacturer thereof, promptly

implement the necessary adjustments, corrections, modifications and/or replacements necessary to be made to meet the specified requirements.

15. Upon completion of the remedial work, the Testing Firm shall repeat all of the tests on components previously found deficient on the first test or any additional test if they be required. Have all remedial Work accomplished as may be required by second and/or additional tests.

## 1.9 PROCEDURE

- A. Secure all required permits, inspections, and approvals and pay all costs and fees.
- B. Unless the Specifications state "No Substitutions", substitutions will be considered for any specified item.
- C. Coordinate safety program with that of the General Contractor. Cooperate with other trades to establish lines, levels, openings, chases, clearances, and locations to avoid interference; and to protect the Work.
- D. Deliver all materials as needed to avoid delays.

## 1.10 INTERPRETATION OF DRAWINGS

- A. Listing of Drawings does not limit responsibility of determining full extent of Work required by the Contract Documents. Refer to Architectural, HVAC, Electrical, Structural, and other Contract Drawings and other sections that indicate types of construction in which Work shall be installed and Work of other trades with which Work of this section must be coordinated.
- B. Except where modified by a specific notation to the contrary, the indication and/or description of any item, in the Contract Drawings or Specifications or both, carries with it the instruction to provide the item, regardless of whether or not this instruction is explicitly stated as part of the indication or description.
- C. Items referred to in singular number in Contract Documents shall be provided in quantities necessary to complete Work.
- D. Drawings are diagrammatic. They are not intended to be absolutely precise; they are not intended to specify or to show every offset, fitting, and component. The purpose of the Contract Drawings is to indicate a systems concept, the main components of the systems, and the approximate geometrical relationships. Based on the systems concept, the main components, and the approximate geometrical relationships, the HVAC FSB shall provide all other components and materials necessary to make the systems fully complete and operational.
- E. Data that may be furnished electronically by the Engineer (on computer tape, diskette, or otherwise) is diagrammatic. Such electronically furnished information is subject to the same limitation of precision as heretofore described. If furnished, such

data is for convenience and generalized reference, and shall not substitute for the Engineer's sealed or stamped construction documents.

#### 1.11 DISCREPANCIES IN DOCUMENTS

- A. Where Contract Drawings or Specifications conflict or are unclear, advise the Engineer in writing before Award of Contract. Otherwise, the Engineer's interpretation of Contract Documents shall be final, and no additional compensation shall be permitted due to discrepancies thus resolved.
- B. Where Contract Drawings or Specifications do not coincide with manufacturers' recommendations or with applicable codes and standards, alert the Engineer in writing before installation. Otherwise, make changes in installed Work as the Engineer requires at no additional cost to the Owner.
- C. If the required material, installation, or Work can be interpreted differently from drawing to drawing, or between Contract Drawings and Specifications, the HVAC FSB shall provide that material, installation, or Work which is of the higher standard.
- D. Provide systems and components that are fully complete and operational and fully suitable for the intended use. There may be situations in the documents where insufficient information exists to precisely describe a certain component or subsystem, or the routing of a component. In cases such as this, where the HVAC FSB has failed to notify the Engineer of the situation as specified, provide the specific component or subsystem with all parts necessary for the intended use, fully complete and operational, and installed in workmanlike manner either concealed or exposed per the design intent.
- E. In cases covered by Paragraph (D) above, where the HVAC FSB needs engineering guidance, submit a sketch identifying his proposed solution and the Engineer shall review, note if necessary, and approve the sketch.

#### 1.12 MODIFICATIONS IN LAYOUT

- A. Drawings are diagrammatic. They indicate general arrangements of mechanical and electrical systems and other Work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet Architectural requirements.
- B. Check Contract Drawings as well as Shop Drawings of all trades to verify and coordinate spaces in which Work of this section will be installed.
- C. Maintain maximum headroom at all locations. All piping, duct, conduit, and associated components to be as tight to underside of structure as possible.
- D. Make reasonable modifications in layout and components needed to prevent conflict with Work of other trades and to coordinate as specified. Systems shall be run in a rectilinear fashion.

- E. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to the Engineer for review and approval.

#### 1.13 RECORD DRAWINGS

- A. As Work progresses and for duration of the Contract, maintain complete and separate set of prints of Contract Drawings at the Project Site at all times. Record Work completed and all changes from original Contract Drawings clearly and accurately including Work installed as a modification or addition to the original design.
- B. At completion of Work prepare a complete set of reproducible record drawings showing all systems as actually installed.
- C. The Engineer will not certify the accuracy of the Record Drawings. This is the responsibility of the HVAC FSB.
- D. The HVAC FSB shall submit the record set for approval by the building department in a form acceptable to the department, when required by the jurisdiction.
- E. Drawings shall show record condition of details, sections, control changes and corrections to schedules. Schedules shall show actual manufacturer and make and model numbers of final equipment installation.

#### 1.14 MATERIAL LIST

- A. Within 4 weeks of Award of Contract, the HVAC FSB shall submit an “HVAC Equipment and Material List”.
- B. The list shall contain all categories of material required with names of intended manufacturers. The list does not replace submittals specified herein.

#### 1.15 MANUFACTURER'S SERVICES

- A. Provide manufacturer's services for testing, training and start-up of the following equipment:
  - 1. Dehumidifier
  - 2. ACCUs
  - 3. Lab Fume Hood Management System
  - 4. Lab Fume Hood Exhaust Fan
  - 5. Makeup Air Unit
  - 6. Gas Fired Unit Heaters
- 2. The time required for each system shall be as specified in this section. The time specified shall be used as directed by the Engineer and shall not be used by the manufacturer or HVAC FSB for field adjustments due to manufacturing or shipping defects. The time allotted shall be one 8 hr day.

3. Proximity of service personnel is a prime concern of the Owner. The Factory trained and certified technicians and service personnel for the preventive maintenance and repair of equipment such as the Dehumidifier must reside within a 2-hour radius of the site (considered to be 120 miles maximum.)

#### 1.16 ELECTRICAL WORK

- A. Except for electrical apparatus specifically called for as part of this Section, all switches and controllers required will be provided under DIVISION 16 - ELECTRICAL.
- B. All electrical apparatus and controls furnished as a part of the Work of this section shall conform to applicable requirements under DIVISION 16 - ELECTRICAL. Enclosure types shall be as indicated on the Contract Drawings.
- C. All motors furnished under this section shall be furnished by the manufacturer of the equipment served and shall be mounted and aligned so as to run free and true. Each motor shall be built to conform to the latest applicable NEMA, ANSI and IEEE standards for the type and duty of service it is to perform.
- D. Each motor shall be designed to operate on 60 Hz., and each shall be expressly wound for the voltage specified. Each motor shall operate successfully as rated load and frequency with a voltage variation of plus or minus 10% of voltage specified.
- E. All motors shall be provided with adequate starting and protective equipment as specified, and each shall have a terminal box of adequate size to accommodate the required conduit and wires.
- F. All electrical apparatus furnished under this section shall be approved by UL and shall be labeled or listed where such is applicable.
- G. All motors shall be TEFC (totally enclosed fan cooled).

#### 1.17 WARRANTIES

- A. Submit manufacturer's standard replacement warranties for material and equipment furnished under this section. Such warranties shall be in addition to and not in lieu of all liabilities, which the manufacturer and the HVAC FSB may have by law or by provisions of the Contract Documents. All refrigeration compressors shall have the manufacturer's extended replacements warranty for a total of 5 years.
- B. All materials, equipment and work furnished under this section shall be guaranteed against all defects in materials and workmanship for a minimum period of 1 year commencing with the Date of Substantial Completion and Final Acceptance by the Owner. Any failure due to defective material, equipment or workmanship which may develop, shall be corrected at no expense to the Owner including all damage to areas, materials and other systems resulting from such failures.
- C. Guarantee that all elements of each system meet the specified performance requirements as set forth herein or as indicated on the Contract Drawings.

- D. Upon receipt of notice from the Owner of the failure of any part of the systems during the guarantee period, the affected parts shall be replaced. Any equipment requiring excessive service shall be considered defective and shall be placed.

#### 1.18 SURVEY AND MEASUREMENTS

- A. Base all required measurements, horizontal and vertical, from referenced points established by the General Contractor and be responsible for correctly laying out the Work required under this section of the Specification.
- B. In the event of discrepancy between actual measurements and those indicated, notify the General Contractor, in writing, and do not proceed with the related Work until instructions have been issued.

#### 1.19 SUPERVISION

- A. Supply the service of an experienced and competent supervisor who shall be in charge of the HVAC Work at the Project Site.

#### 1.20 SAFETY PRECAUTIONS

- A. Comply with all of the safety requirements of OSHA throughout the entire construction period of the Project.
- B. Provide and maintain proper guards for prevention of accidents and any other necessary construction required to secure safety of life and/or property.

#### 1.21 SCHEDULE

- A. Construct Work in sequence under provisions of DIVISION 1 - GENERAL REQUIREMENTS.

#### 1.22 SPARE PARTS

- A. Furnish spare-parts data for every component that is required to be maintained for normal service of equipment furnished (as determined by the equipment manufacturer). The data shall include a complete list of parts and supplies, with current unit prices and source of supply; a list of parts and supplies that are either normally furnished at no extra cost with the purchase of the equipment, or specified hereinafter to be furnished as part of the Contract; and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 180 days at the particular installation. The foregoing shall not relieve the HVAC FSB of any responsibilities under the guarantees specified herein.

### 1.23 HOISTING, SCAFFOLDING AND PLANKING

- A. The Work to be done under this section of the Specifications shall include the furnishing, set-up and maintenance of all derricks, hoisting machinery, scaffolds, staging, planking, ladders, etc. as required for the Work.

### 1.24 SLEEVES, INSERTS, ANCHOR BOLTS, AND PLATES

- A. Be responsible for the furnishing, location of and the maintaining in proper position all sleeves, inserts and anchor bolts supplied and/or set in place for the work of this section. In the event that failure to do so requires cutting and patching of finished Work, it shall be done at the HVAC FSB expense without any additional cost to the Owner. See other sections for sleeve material description.

### 1.25 SUPPLEMENTARY STEEL, CHANNELS AND SUPPORTS

- A. Provide all supplementary steel, channels and supports required for the proper installation, mounting and support of all HVAC equipment, piping, etc., required by the Specifications.
- B. Supplementary steel and channels shall be firmly connected to building construction in a manner approved by the Engineer.
- C. The type and size of the supporting channels and supplementary steel shall be determined by the HVAC FSB and shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for loading.
- D. All steel used for supplementary steel, channels and supports shall be 316 stainless steel.

### 1.26 CERTIFICATES OF INSPECTION/APPROVAL

- A. Furnish upon completion of all Work, certificates of inspections from the manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and found same to be in satisfactory operating conditions.

### 1.27 ACCESSIBILITY

- A. All Work shall be installed so that parts requiring inspection, operation, maintenance and repair are readily accessible. Minor deviations from the Contract Drawings may be made to accomplish this, but changes of substantial magnitude shall not be made prior to receipt of written approval from the Engineer.

## 1.28 DEFINITIONS

- A. As used in this section, the following terms are understood to have the following meanings:
1. "Furnish" shall mean purchase and deliver to the project site, complete with every necessary accessory and support.
  2. "Install" shall mean unload at the delivery point at the site and perform all work necessary to establish secure mounting, proper location and operation in the project.
  3. "Provide" shall mean furnish and install.
  4. "Work" shall mean all labor, materials, equipment, apparatus,, controls, accessories, and all other items required for a proper and complete installation.
  5. "Piping" shall mean, in addition to pipe or tubing, all fittings, flanges, unions, valves, strainers, drains, hangers and other accessories relative to such piping.
  6. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, embedded in construction or in crawl space.
  7. "Exposed" shall mean not installed underground or concealed as defined above.
  8. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the general contract and connected to the systems covered by this section of the specifications by the HVAC FSB.
  9. "Coordinate" shall mean all work provided under this section of the specification shall be in compliance with work of other trades.

## PART 2 PRODUCTS

### 2.1 GENERAL

#### A. CONDENSATE PIPE AND FITTINGS

1. Condensate drain piping shall be Type 1, Grade 1, Class 12454-B, Schedule 40 polyvinyl chloride (PVC) pipe conforming to ASTM D-1785. Drain piping shall have Schedule 40 PVC socket fittings conforming to ASTM D-2466. All joints between pipe and fittings shall be solvent cemented joints conforming to ASTM D-2235 and ASTM D-402. Provide protection for PVC piping exposed to weather from ultraviolet radiation. All condensate drains shall have an insect screen at the end of pipe at the exterior.

## B. HANGERS AND SUPPORTS

1. All hangers and supports shall be 316 stainless steel (SS).
2. Pipe hangers shall conform to MSS SP 58 and SP 69. Pipe hangers for piping 4 inch and larger shall have rolls either of the Harvard type or 2 rod type. Pipe hangers for 3 inch pipe and under shall be clevis type. Pipe hangers for pipe less than 2 inch may be 1A band type in lieu of clevis type. Hangers in contact with copper tubing shall be copper plated.
3. All hangers on insulated piping shall be sized to fit the outside of the covering. Provide spacer blocks and 16 gauge SS protection shields (12 inches long) at hangers, when pipe is installed.
4. Duct hangers shall be in accordance with the "HVAC Duct Construction Standards" published by the Sheet Metal and Air Conditioning Contractors National Association, Incorporated (SMACNA).
5. Where support points are required to avoid other Work, provide a system of channels and angles between support points as required. Provide all necessary supports and cross framing. No part of piping, ductwork, equipment, and the building shall be stressed beyond its normal allowable working strength.

## C. UNIONS

1. Unions for PVC pipe 2 inch and smaller shall be Schedule 40 PVC.

## D. PIPING SPECIALTIES

1. Provide dielectric couplings or flanges in all copper to ferrous transitions.
2. Sleeves
  - i. Provide sleeves at all penetrations. Sleeves shall be 316 stainless steel. Sleeves shall be sized to allow 1/2 inch of annular space between the covering (or bare pipe) and the inside of the sleeve.
  - ii. Pipe penetrations of walls below grade shall be sleeved and sealed using Thunderline Link-Seal wall sleeves and seals.
  - iii. Pack the annular space and seal with caulking flush with finished surface.
  - iv. Sleeves in concrete construction shall be galvanized steel pipe, except where passing through exterior walls and slabs-on-grade they shall be ductile iron. Sleeves passing through floors shall project two inches above the finish floor and sleeves passing through walls shall be trimmed flush with the wall surface.

## E. REFRIGERANT PIPING AND ACCESSORIES

1. Refrigerant piping shall be Type L hard drawn copper tubing cleaned, dehydrated and capped for refrigerant service conforming to ASTM B 280. Refrigerant piping

shall have wrought copper brazed joint pressure fittings conforming to ANSI B 16.22. All joints shall be made using a brazing alloy containing silver or using a copper - phosphorous alloy. Brazing alloys shall have a minimum of 1100 degree F melting temperature and shall conform to ASTM B 260.

2. Filter dryer in the liquid line shall consist of a steel cylinder filled with a suitable desiccant that will not plug, cake, rust, channel or break down and shall remove both water and acid from the refrigerant. The dryer shall be constructed so that none of the desiccant will pass into the refrigerant lines. The filter dryer shall be the replaceable core type "catch all" as manufactured by Sporlan Alco or approved equal.
3. Provide all accessories and appurtenances to provide a complete and properly functioning refrigerant system under all conditions of operation.
4. Install all refrigerant piping in accordance with the requirements of ASME Standard B 31.5, refrigerant piping; and ASHRAE Standard 15, standard safety code for mechanical refrigeration. All refrigerant piping shall be installed to ensure that all oil returns to the compressor. Suction line piping shall be sized on a pressure drop between the evaporator and compressor equal to an equivalent temperature of not greater than 2 degrees F, with a velocity in the vertical rise of not less than 1000 fpm. Liquid line piping shall be sized on a pressure drop not to exceed 5 psig. Provide the minimum number of piping joints to limit refrigerant leaks.
5. Refrigeration system installation shall be in accordance with all state and local codes.

F. **SPLIT SYSTEM HEAT PUMP FOR CONTROL ROOM AND ELECTRICAL ROOM**

1. The variable capacity heat pump air conditioning system shall be a split system ceiling cassette type as indicated. The system shall consist of an evaporator and a two-pipe refrigeration distribution system using PID control. The outdoor unit is a direct expansion (DX), air-cooled heat pump, multi-zone air-conditioning system with variable speed driven compressors using R-410A refrigerant. The outdoor unit may connect an indoor evaporator capacity up to 200% of the outdoor condensing unit capacity. Provide controllers, etc. to provide individual temperature control. LG, Trane, Climatemaster, Mitsubishi or equal. Unit cabinet shall be 20 gauge galvanized steel, with prime coat and two-part epoxy finish.
2. The indoor unit shall be connected to the condensing unit utilizing proprietary piping joints and headers to ensure correct refrigerant flow and balancing. The manufacturer shall submit piping installation drawings for review and approval by the Engineer.
3. Provide interconnecting piping and interlock wiring.
4. R410a refrigerant.

5. Heating & cooling capability must be available when the outside temperature is as low as -10°F. The Cooling Capacity SEER shall be 20.5 or greater and the Heating Capacity HSPF shall be 9.7 or greater.
6. Energy Star Tier II rated.
7. The condensing unit shall use a high efficiency, variable speed “inverter” compressor coupled with inverter fan motors for part load performance. Compressor capacity shall be modulated automatically to maintain a constant suction pressure, while varying the refrigerant volume for the needs of the cooling or heating loads. Indoor fan coil units shall use PID control to control superheat to deliver a comfortable room temperature condition.
8. Provide compressor with crankcase heater to prevent oil dilution on off cycle, and suction line thermostat to stop compressor when suction line temperature falls below setpoint.
9. Provide 24-inch-high support stand with snow shield for outdoor condensing units to lift units off the ground and mitigate impact of snow and ice falling from the roof. Stand shall be equal to Quick Sling by DiversiTech.
10. Hard-wired controller for wall mounting. Packaged controls with BACnet interface.
11. Provide contactor, 24 V control transformer, blower relay, lockout relay and low voltage terminal board and remote mounted H-C deadband-type thermostat with sub-base. Heating setpoint shall be 70 deg F and cooling setpoint shall be 75 deg F.
12. Provide circuit to lock compressor off when safety controls have been activated. Unit shall not be restartable until room thermostat has been turned off and on.
13. Provide factory-mounted air filters.
14. The drain pan shall be constructed to inhibit corrosion and fully insulated. Drain outlet shall be located on pan as to allow complete and unobstructed drainage of condensate. Vertical units will be supplied with factory installed trap inside of cabinet. The unit as standard shall be supplied with solid-state electronic condensate overflow protection conforming to UL 508 that shuts off the unit when the primary drain is blocked. Mechanical float switches will not be accepted.
15. Furnish and install a condensate pump for the fan coil unit. Pump shall be equal to Little Giant with plastic body, float, and pump. Pump shall be wired to the heat pump electrical supply.
16. Insulate evaporator and compressor compartment panels with 1-1/2 lb. fibrous glass insulation.

17. Provide either direct drive ECM or belt-driven evaporator blowers with common shaft and three speed switch. Belt-driven evaporator blower motor shall be 1750 rpm, three-phase, with inherent overload protection or starter with quick trip heaters and sealed ball bearings.

#### G. AIR-COOLED CONDENSERS FOR DEHUMIDIFIER

1. Provide outdoor-mounted, factory-assembled, single piece, air-cooled condenser as part of a dehumidifier as manufactured by Desert Aire, Dehumidifiers Corp of America (DCA), Munters or approved equal. Air cooled condenser and dehumidifier shall be by the same manufacturer. Air cooled condenser shall consist of an air-cooled coil, hot gas bypass valve, integral subcooler, propeller-type condenser fans, and a control box. Contained within the unit enclosure shall be all factory wiring, piping, controls, refrigerant holding charge, and all accessories indicated. Units shall have single or multiple independent refrigeration circuits as is furnished standard by the manufacturer. Units shall discharge cooling air vertically upward. Units shall be used in a refrigeration circuit matched with a packaged fan coil unit.
2. Units shall be rated in accordance with ARI Standard 210/240 or 365 as applicable. Unit construction shall comply with ANSI/ASHRAE 15 safety code latest revision and comply with NEC. Units shall be constructed in accordance with UL standards and shall carry the UL label. **Any alternate units submitted shall have a noise rating no louder than the specified units.**
3. Unit Cabinet
  - i. Unit cabinet shall be constructed of galvanized steel, bonderized and coated with a pre-painted baked enamel finish or aluminum. Unit cabinet shall be capable of withstanding 500 hour salt spray exposure per ASTM B117 (scribed specimen).
  - ii. A heavy-gauge roll-formed perimeter base rail with forklift slots and lifting holes shall be provided to facilitate rigging. Units shall have hinged or removable panels for service access to all components.
4. Fans
  - i. Condenser fans shall be direct driven, propeller-type with fan blades statically and dynamically balanced. Condenser fan discharge openings shall be equipped with wire safety guards constructed of coated steel or corrosion resistant metal. Condenser fan and motor shaft shall be corrosion resistant.
5. Condenser Coils
  - i. Condenser coils shall be air-cooled and circuited for integral subcooler. Coils shall be constructed of aluminum fins or copper fins mechanically bonded to internally grooved seamless copper tubes which are then cleaned, dehydrated, and sealed. Condenser coils for semi-hermetic compressor units shall be leak tested at 150 psig and pressure tested at 480 psig, and for hermetic compressor

units shall be leak tested at 200 psig and pressure tested at 428 psig. Acceptance criteria for test duration and leakage shall comply with the applicable AHRI manufacturing standard.

- ii. Coils shall be protected by a sheet metal casing to eliminate the need for wind baffles and avoid damage due to the elements and vandalism.

#### 6. Refrigeration Components

- i. Refrigeration circuit components and arrangement shall be as recommended by equipment manufacture, including an ORD valve and subcooler.

#### 7. Controls and Safeties

- i. Minimum control equipment shall include:
  - a) Power and control terminal blocks.
  - b) Head pressure control to fixed set point between 50 – 55 degrees F ambient temperature by fan cycling. One condenser fan shall be cycled by ambient temperature to maintain proper head pressure.
  - c) Type ORD Hot Gas Bypass Valve.
  - d) Sub Cooler.
- ii. Minimum safety devices which are equipped with automatic reset (after resetting first at thermostat), shall include:
  - a) High discharge pressure cutout.
  - b) Low suction pressure cutout.
  - c) Condenser fan motors protection against overload or single-phase condition by internal overloads.
  - d) Electrical overload protection through the use of definite-purpose contactors and calibrated, ambient-compensated, magnetic trip circuit breakers. Circuit breakers shall open all 3 phases in the event of an overload in any one of the phases or a single-phase condition.

#### 8. Electrical Requirements

- i. Unit electrical power shall be single-point connection. Unit control circuit shall contain a 24-volt transformer for unit control.

#### 9. Accessories

- i. Provide the accessories indicated on the Contract Drawings and as specified herein.
- ii. Install Remote Condenser as indicated on support detail on the drawings. NOTE: Set Condenser on stand with steel dunnage arranged so Condenser is not more than 10 feet below Dehumidifier.

## H. DEHUMIDIFIER

1. Provide indoor, draw-thru, packaged dehumidifier as manufactured by Desert Aire, Dehumidifiers Corp of America (DCA), Munters, or approved equal. Dehumidifier and Air Cooled Condenser shall be by the same manufacturer. Units shall be capable of horizontal installation on a suspended structural frame as indicated on the Contract Drawings, with or without ductwork. Units shall have direct-expansion coils, compressor, and thermostatic expansion valve and associated controls. Where shown on the Contract Drawings each unit shall be used with a matching air-cooled condenser. Units shall consist of supply fan(s), motor and drive assembly, pre-wired fan motor contactor, factory-installed refrigerant metering devices, factory installed temperature sensor and relative humidity sensor, disposable air filters and condensate drain pans.
2. The dehumidifier is configured to remove moisture at low space temperature (32 to 70°F). The system is equipped with an adjustable timer which will initiate the defrost cycle (if it is needed). The need to defrost is determined by monitoring the suction line temperature and activating the defrost when it drops below 30°F. During the defrost cycle, the blower is disengaged and 100% of the system's heating capacity is diverted to the evaporator where it quickly thaws the coil. The defrost cycle is monitored and automatically terminates when suction line temperatures confirm that the evaporator has fully thawed. There is an additional safety timer which limits the total defrost time to 10 minutes. If the facility cannot, at times, accept the recovered heat, then the remote condenser installed outside provides the full cooling capacity. In this mode, a thermostat is also installed in the facility. If the air temperature should exceed the desired set point, the controller will shift the dehumidifier from the reheat mode and reject all of the energy to the remote condenser, thereby providing sensible cooling to the space.
3. Refrigerant shall be R-407c or as noted by Vendor.
4. Coils shall be designed and tested in accordance with ASHRAE 15 Safety Code for Mechanical Refrigeration, latest edition. Units shall be constructed in accordance with ETL standards and shall carry the ETL label.
5. The Dehumidifiers shall be installed on a platform furnished by the PEMB manufacturer. The platform shall include an access ladder to allow routine maintenance.
6. Unit Cabinet
  - i. Cabinet shall be constructed of a minimum 16 gauge mill galvanized steel with removable panels for serviceability. Units shall be painted with a power-coat type paint capable of withstanding 500-hour salt spray exposure per ASTM B117.
  - ii. Cabinet panels shall be fully insulated with ½ inch fire-retardant material. Unit insulation and adhesive shall comply with NFPA-90A requirements for flame spread and smoke generation. Insulation shall contain an EPA-registered immobilized antimicrobial agent to effectively resist the growth of

bacteria and fungi as proven by tests in accordance with ASTM standards G21 and 22.

- iii. Units shall contain stainless steel condensate drain pan. Drain pan shall have connections on right and left sides of unit to facilitate field connection. Drain pans shall have the ability to be sloped toward the right or left side of the unit to prevent standing water from accumulating in pans.

#### 7. Fans

- i. Units shall consist of forward-curved belt-driven centrifugal fan(s), motor and drive assembly, and pre-wired fan motor contactor. Fan motor of the size and electrical characteristics specified on the equipment schedule shall be factory supplied and installed.

#### 8. Condenser and Evaporator Coils

- i. Coils shall be direct expansion type and consist of 3/8 inch copper tubes with sine-wave aluminum fins bonded to the tubes by mechanical expansion. Coil tubing shall be internally rifled to maximize heat transfer. Suction and liquid line connections shall be made on the same side of the coil. Coils shall feature factory-installed thermostatic expansion valves (TXVs) for refrigerant control. The TXVs shall be capable of external adjustment. Coils shall be burst tested at 435 psi and leak tested at 150 psi. Coils shall be properly separated from each other to prevent re-hydration.

#### 9. Electrical Requirements

- i. Unit electrical power shall be single-point connection. Unit control circuit shall contain a 24-volt transformer for unit control.
- ii. Provide auxiliary contacts to shut down system upon signal from smoke detector.
- iii. Provide dry contacts in the electrical panel to close upon high dewpoint signal. (adjustable, setup for 55 deg F) Wire from SCADA system to dry contacts on Dehumidifier for alarm notification.
- iv. HVAC Contractor is responsible to furnish cable to connect controllers to DHUs. See 9.i.a following.

#### 10. Accessories

- i. Provide the following accessories where indicated on the Contract Drawings and as required.
  - a. Microprocessor Controller: Desert Aire CM 3540 or approved equal standalone wall mounted with Remote Display Terminal. Controller shall sequence dehumidification cycles for the Dehumidifier and the Remote Condenser and shall display operating parameters including space temperature, relative humidity, and occupied/unoccupied schedule. Program unit for constant occupancy. HVAC contractor is responsible to furnish control cable of sufficient length to connect each

controller to its respective Dehumidification Unit. **Controls shall include dry contacts for dewpoint temperature high limit for connection to SCADA.**

- b. Condensate Drain Trap: Trap shall have transparent, serviceable design for easy cleaning.
- c. Air Filters: Units shall have factory supplied 30% efficient 4-inch MERV 7 throwaway type filters installed upstream from the cooling coil. Filter access shall be from either the right or left side of the unit.
- d. Low ambient defrost control.
- e. Subcooler.
- f. ORD valve.

11. Service Representative Availability: Proximity of service personnel is a prime **concern of the Owner**. The Factory trained and certified technicians and service personnel for the preventive maintenance and repair of the Dehumidifier must reside within a 2-hour radius of the site (considered to be 120 miles maximum.) Equipment submittal shall include the municipality where the personnel resides.

## I. ELECTRIC UNIT HEATERS

- 1. Provide propeller type electric unit heaters as manufactured by Indeeco, Qmark, Electromode, or approved equal designed for horizontal. Heaters shall be of the draw-through air flow design to eliminate element hot spots and extend design life. Units shall be UL listed, and shall comply with National Electrical Code and OSHA requirements.
- 2. Casing
  - i. Cabinet shall be made of not less than 22 gauge die formed cold rolled steel with smooth contours and minimization of exposed fasteners. All metal surfaces of the enclosure shall be cleaned of all oils and phosphate coated to resist corrosion, then finished in a electrostatically applied decorative baked enamel for optimum corrosion protection.
  - ii. Individual adjustable louvers with 30 degrees downward stops shall be furnished to provide desired control of discharge air.
  - iii. Mounting brackets designed for either ceiling or wall swivel mounting shall be furnished.
- 3. Heaters
  - i. All heaters shall be UL Listed and meet the requirements of the National Electrical Code. The electric heating bank shall consist of metal sheath heating elements. The elements shall consist of 80/20 Ni-chrome wire and have a copper clad steel sheath for strength and corrosion resistance, and aluminum fins. The heating bank shall have protective air inlet louvers. All heaters drawing in excess of 48 amperes shall be provided with factory installed subdivided and fused circuits of 48 amperes or less.
- 4. Fan/Motor Assembly

- i. Each unit shall have a single motor and direct drive propeller fan completely factory assembled and resiliently mounted. Motor shall be totally enclosed. Single phase motors shall be equipped with thermal overload protection. Fans shall be aluminum. Fans shall be statically and dynamically balanced for quiet operation. Propeller fan shall be equipped with a safety fan guard.

#### 5. Controls

- i. Provide integral control transformer and contactor integral to unit heater. All controls shall have pig tails and spade terminals for ease of wiring to centrally located terminal board.
- ii. Heaters shall be equipped with automatic reset thermal overload protection of the linear capillary type wired for instantaneous de-energizing in case of the thermal overload.
- iii. Fans shall have delay on both start and stop. Upon call for heat, fan start shall be delayed until heating element is warm. When thermostat is satisfied, fan stop shall be delayed until heating element is cool.
- iv. Wall mounted thermostat with NEMA4 cover.

#### 6. Accessories: Factory furnished and installed disconnect switch.

### J. NATURAL GAS FIRED UNIT HEATERS

1. Provide high efficiency, natural gas fired unit heaters as manufactured by Modine, Trane, Sterling or approved equal. Unit heaters shall have AGA (American Gas Association) design certification. The output capacity shall be AGA certified to be a minimum of 80% of the input based on steady-state thermal efficiency.

#### 2. Casing

- i. The unit heater casing shall be constructed of not less than 20 gauge die formed cold rolled steel, with smooth contours and minimization of exposed fasteners. All metal surfaces of the enclosure shall be cleaned of all oils and phosphate coated to resist corrosion, then finished in an electrostatically applied decorative baked enamel for optimum corrosion protection.
- ii. Casing shall have a removable or hinged panel for easy access to the burner compartment.
- iii. Unless otherwise indicated on the Contract Drawings and as specified hereinafter, horizontal air deflector louvers shall be provided to aid in controlling the discharge air pattern.

#### 3. Burner

- i. Burner material shall be 409 stainless steel with non-clogging, slotted ports with 409 stainless steel separator strip designed for good lighting characteristics without noise of extinction.

#### 4. Heat Exchanger

- i. Unit heat exchanger shall be constructed of 409 stainless steel. Heat exchanger shall be heliarc machine-welded and designed with contoured stress-free tubes.

#### 5. Venting

- i. Each unit shall have a factory mounted and wired integral power exhaustor directly connected to the unit collector box assembly. The unit shall also include a factory mounted and wired safety pressure switch designed to prevent pilot and main burner ignition until positive venting has been proved. Filter Room units shall be designed for single vent connection.
- ii. HVAC FSB shall furnish a concentric vent kit for each Unit Heater to the Plumbing FSB contractor for installation.

#### 6. Fan/Motor Assembly

- i. Each unit shall have a single motor and direct drive propeller or centrifugal fan, as indicated on drawings completely factory assembled and resiliently mounted. Motor shall be totally enclosed. Single phase motors shall be equipped with thermal overload protection. Fans shall be aluminum. Fans shall be statically and dynamically balanced for quiet operation. Propeller fans shall be equipped with a safety fan guard.

#### 7. Controls

- i. All units shall include a 2 stage control system, pilot valve, low voltage control transformer, safety high limit control (overheat control), safety pressure switch, gas pressure regulator, manual shut-off valve and terminal board for low voltage wiring. All gas controls shall be rated for a maximum inlet pressure of 1/2 psi and shall be exposed for easy access. All units shall have energy saving electric ignition with electronic flame supervision.

#### 8. Accessories

- i. Provide the accessories as indicated on the Contract Drawings.
- ii. Adjustable horizontal discharge louvers.

### K. ELECTRIC WALL HEATER

1. Provide electric wall heater as manufactured by Qmark, Berko, Faherheat or approved equal. Wall heater shall consist of 20 gauge steel with a white factory painted polyester finish for corrosion resistance, steel support brackets, nickel chromium wiring in a steel sheath with aluminum fins, integral circulation fan, integral junction box, and integral thermostat. Units shall be UL listed, and shall comply with National Electrical Code and OSHA requirements.

## L. MAKE UP AIR UNIT

### 1. General Description

- i. Fabricate draw-thru type indoor air handling units suitable for the capacities scheduled on the drawings as manufactured by Greenheck, Accurex, AAON, or approved equal.
- ii. Fabricate units as indicated on the drawings.
- iii. Factory fabricate and test air handling unit of size, capacity, and configuration as indicated and specified.
- iv. Base performance on sea level conditions.
- v. The following internal components shall be factory furnished and installed, including, but not limited to, a lockable disconnect and a fan motor starter. Unit(s) shall be completely factory assembled.
- vi. Units shall ship in one (1) piece where possible. Shipping splits can be provided for installation. Lifting lugs will be supplied on each side of the split to facilitate rigging and joining of segments. Units requiring field installed gasketing must be assembled under supervision by factory trained and employed personnel from the air unit manufacturer.
- vii. **This equipment is part of the Lab Hood Exhaust / Makeup Air system. See bid drawing H-1 for the equipment Sequence of Operation.**

### 2. Casing

- i. All segments shall be double wall and shall be constructed of G90 mill galvanized sheet steel, formed and reinforced to provide a rigid assembly. The exterior casing shall be constructed of a minimum 18 gage galvanized steel. The interior lining shall be a solid lining of a minimum of 20 gage galvanized steel. All cabinet walls, access doors, floor and roof shall be fabricated of double wall, impact resistant, fiberglass or polyurethane foam panels. Note that units are installed on dunnage and exposed underneath.
- ii. Insulation shall be at least 1-inches thick, have a minimum density of 1-1/2 pounds/cubic foot and have a minimum R-value of 6.25. Foam insulation shall be tested in accordance with ASTM D-1929 for a minimum flash ignition temperature of 610°F. Insulation shall meet the flame and smoke generation requirements of NFPA-90A.
- iii. Unit shall be designed to reduce air leakage and infiltration through the cabinet. Cabinet leakage shall not exceed 1% of total airflow when tested at the minimum external static pressure provided in AHRI Standard 340/360. Panel deflection shall not exceed L/240 ratio at 125% of design static pressure. Continuous sealing shall be included between panels and between access doors and openings to reduce air leakage. Piping and electrical conduit through cabinet panels shall include sealing to reduce air leakage.
- iv. Access to filters, dampers, supply fans and electrical and controls components shall be through hinged access doors with quarter turn, zinc cast, lockable handles. Doors shall be double wall construction with a solid liner and a minimum thickness of 1 inch. Double wall access doors shall be provided in the fan, and also for the control cabinet. All hinged panels shall

- be provided with suitable gasketing to prevent moisture leakage. Furnish unit with duct flanges at inlet and outlet.
- v. The entire unit shall be provided with a full-length, continuous, base rail channel. Base rail channels will be formed of a minimum of 12 gage galvanized steel. All major components shall be supported from the base. Integral lifting lugs shall be provided. If an integral base rail is not furnished with the unit, the HVAC FSB is responsible to furnish and install a base rail support equal to Thycurb.
3. Furnish unit with damper section consisting of a 100% outside air damper and spring return damper actuator. Unit shall include an inlet damper end switch which will not allow the unit to operate until the damper is at least 80% open. Damper shall be low-leak type constructed of 16 gage galvanized steel with blade edge seals and jamb seals.
  4. Fans
    - i. The supply fan segment shall be equipped with axial, plenum or double width double inlet (DWDI) centrifugal type wheels. All fans shall be backward curved or airfoil selected for stable operation.
    - ii. Fan and unit performance shall be rated and certified in accordance with ARI Standard 430. All units that are not ARI Certified shall be witness tested at an independent laboratory to assure performance.
    - iii. All airfoil fans shall bear the AMCA Seal. Airfoil fan performance shall be based on tests made in accordance with AMCA standards 210 and comply with the requirements of the AMCA certified ratings program for air and sound.
    - iv. Fans shall be fabricated in accordance with Air Moving and Control Association
    - v. After the pre-balanced fan is installed in the air handler, the entire fan section shall be run-balanced at the specified speed to insure smooth and trouble-free operation.
    - vi. Fan and fan motor shall be internally mounted and isolated on a full width isolator support channel using 2" springs. The fan discharge shall be connected to the fan cabinet using a flexible connection. The isolator support rail shall be structurally supported from the unit base. Cantilever supports of the isolator support base are unacceptable.
  5. Bearings and Drives
    - i. All bearings shall be factory lubricated. Fan bearings shall be self-aligning, pillow block or flanged type regreaseable ball bearings and shall be designed for an average life (L50) of at least 200,000 hours.
    - ii. Fan drive shall be selected for a 1.5 service factor.
    - iii. Fan shaft shall be selected to operate well below the first critical speed and each shaft shall be factory coated after assembly with an anti-corrosion coating.
    - iv. Unit shall be furnished with an integral factory installed motor starter matched to the specified motor size.

- v. After final assembly, the fan and motor assembly shall be factory balanced.
6. Electrical Characteristics and Components
- i. Single electrical power connection point.
  - ii. Fan motors shall be Totally Enclosed Fan Cooled type.
  - iii. The motor shall be mounted on the same isolation base as the fan.
  - iv. Each unit shall be equipped with a factory furnished and installed lockable disconnect switch. The disconnect shall be mounted in a NEMA 3R enclosure. The disconnect shall be UL listed.
  - v. The disconnect shall be factory wired to the power panel. All wiring shall be Class 1 Division 2. All wiring shall be done in accordance with the latest N.E.C. Guidelines.
7. Gas Burner
- i. Gas burner shall be separated combustion type with a ducted combustion air inlet and a separate gas vent discharge. HVAC FSB contractor shall furnish a concentric vent kit to the Plumbing FSB contractor for installation on the gas vents.
  - ii. Heat exchanger shall be manufactured of 409 stainless steel.
  - iii. Burner control shall be at minimum a 5 stage turndown type capable of firing rates between 20% and 100% of full capacity.
  - iv. Furnish a supply air discharge temperature controller compatible with the gas burner controller.
  - v. Furnish unit with standard gas manifold consisting of black iron piping with malleable iron threaded fittings. Furnish unit with a main redundant safety shut-off valve with servo regulator, safety pilot valve, and manual shutoff valve.
8. Filters
- i. Furnish unit with a filter section and rack. Filter Segments shall accommodate 2-inch media. Media shall be MERV 13 pleated type.
  - ii. The filters shall be sealed against the filter frame with spring-loaded, nut and clip assemblies to prevent air bypassing around the filter.
9. Control Components
- i. Unit shall include microprocessor control for programmable operation and sequencing of the gas burner, supply fan and control dampers.
  - ii. Discharge air temperature controller.
  - iii. Furnish unit with relay mounted inside the cabinet. Relay shall start the unit supply blower upon receiving a signal from the Hood Management System.
  - iv. Unit supply fan speed shall be start/stopped via an external signal input. See Sequence of Operation for description.

## M. FANS

1. Centrifugal in-line fans shall be of the centrifugal belt driven or direct drive in-line type as manufactured by Greenheck, Cook, Penn, or approved equal. All fans shall bear the AMCA Certified Ratings Seal for both sound and air performance. **Fan EF-2 for the Sodium Hypochlorite and Potassium Hydroxide Storage Rooms shall have the internals, including the wheel, completely coated with a chemical resistant coating equal to Greenheck Hi-Pro Polyester.**
  - i. The fan housing shall be of the square design constructed of heavy gauge galvanized steel or aluminum and shall include square duct mounting collars. Fan construction shall include two removable access panels located perpendicular to the motor mounting panel. The access panels shall be of sufficient size to permit easy access to all interior components.
  - ii. The fan wheel shall be centrifugal backward inclined, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced.
  - iii. Motors shall be totally enclosed, heavy-duty ball bearing type, carefully matched to the fan load and furnished at the specified voltage, phase and enclosure. Motors and drives shall be mounted out of the air stream. Motors shall be readily accessible for maintenance. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings. Bearings shall be selected for a minimum (L10) life in excess of 100,000 hours at maximum cataloged operating speed. Drives shall be sized for a minimum of 150% if driven horsepower. Pulleys shall be of the fully machined cast iron type, keyed and securely attached to the wheel and motor shafts. Motor sheaves shall be adjustable for final system balancing.
  - iv. Accessories:
    - a. Furnish and install break glass wall switch for EF-2. Switch shall be a Push Button Station with 30mm Selector Switch in a NEMA 4X enclosure equal to Allen Bradley.
    - b. Furnish and install signage at EF-2 wall switches. Sign shall read "Break Glass for Fan Emergency Shutoff."
    - c. EF-4 shall be controlled by the room light switch.
    - d. EF-5 shall be controlled by a manual switch in "Hand" mode and by the Refrigeration Monitor system in "Auto" mode.
    - e. Furnish and install manual wall switch for EF-6. Switch shall be a Pushbutton Station with 30mm Selector Switch in a NEMA 4X enclosure equal to Allen Bradley. Furnish and install signage at EF-6 manual wall switch. Sign shall read "Start Fan upon entering building. Shut fan off when leaving building" Provide additional accessories as indicated on the Contract Drawings.
2. Centrifugal wall mount fans shall be of the centrifugal belt driven or direct drive in-line type as manufactured by Greenheck, Cook, Penn, or approved equal. All

fans shall bear the AMCA Certified Ratings Seal for both sound and air performance. Fan impellers shall be statically and dynamically balanced.

i. Accessories:

3. The Lab Hood Exhaust Fan for the Fume Hood in the Control Room (see specification section 15900) shall be a corrosion resistant utility set blower equal to MK Plastics. The fan shall consist of FRP construction including body, solid molded impeller with radial tip curved blades, access door, weather hood, and flanged outlet connection. Housing shall be aerodynamically designed with high efficiency inlet to reduce incoming air turbulence. Impeller shall be statically and dynamically balanced. Enclosure fasteners shall be encapsulated in FRP. Fan motor shall be inverter duty suitable for Variable Frequency Drive application.

N. DUCTWORK

1. Provide all sheet metal ductwork required for the various supply and exhaust air systems. Unless otherwise indicated on the Contract Drawings or in these specifications, ductwork shall be 316 stainless steel duct. All ductwork and sheet metal plenums shall be constructed meeting the requirements of ASTM A 653, lock-forming quality. Stainless steel sheet metal shall conform to ASTM A 167. All ductwork, except where specified otherwise herein, shall be fabricated in accordance with the "HVAC Duct Construction Standards for Metal Ducts" published by the Sheet Metal and Air Conditioning Contractors National Association, Incorporated (SMACNA), 2 inch water gauge Pressure Class.
2. **Exhaust Ductwork from the Chemical Storage Area shall be Kynar (PVDF) round ductwork from the Ceiling Exhaust Fans in the room to the EF-2 inlet.** Duct shall be equal to SimTech. As alternates, the ducting can be CPVC PROVIDED it is fabricated and installed with silica-free cement and material.
3. Ductwork for the Fume Hood shall be 316 stainless steel round ductwork from the connection at the Fume Hood to the discharge termination of the exhaust stack outside the building. The exhaust stack system shall include wall supports provided by the duct vendor and shall be equal to Wall Support Assembly by Metal Fab. The wall support assembly shall consist of a full angle ring, two clamp rings, wall brackets and struts. The brackets shall attach to the building structure. **The Fume Hood duct vendor shall review the building structural drawings and shall fabricate Wall Support Assemblies that coordinate with the building structure. See specification section 15900 for the Fume Hood specification.**
4. Ducts shall be true to the inside dimensions indicated on the Contract Drawings. Cross break all duct panels over 12 inches wide. Support ducts rigidly and securely. Support horizontal ducts not over 8 feet on center. Ducts shall be straight and smooth on the inside with neatly finished joints and all transverse joints and longitudinal seams of all low pressure ducts shall be sealed in conformance with SMACNA seal classification B.

5. Elbows narrower than 16 inches shall be full radius elbows with inside radius equal to the dimension of the duct in the plane of the elbow or offset. Elbows wider than 16 inches may be full radius elbows or square elbows with air foil section turning vanes (Duct Manual Figure 2-3) and 6 inch inside radius. Vanes shall be "Runner" Type 2, 3 1/4 inches on centers. Install outside vane flush against the outside of the elbow.
6. Transitions in duct mains and branches shall be made with sides sloping at not more than 1 inch in 7 inches on the side of the transformation for diverging transitions and 1 inch in 4 inches for converging transitions. Transitions in ductwork to pieces of equipment shall be made with a 20 degree maximum angle projected from the straight duct side on a diverging transition and a 30 degree maximum angle projected from the straight duct side on a converging transition. Any conditions requiring deviations from the above shall be brought to the attention of the Engineer for approval.
7. All notches for connecting sections of duct, including longitudinal seam notches, shall not be cut any deeper than 1 7/8 inches to insure tight corners in 2 inch deep slip joints.
8. Slips shall be at least 2 gauges heavier than the duct and all joints shall be made in a neat and workmanlike manner and in all cases shall be tight. All ducts shall have all joints sealed with EC-800 as manufactured by 3M, Hardcast or approved equal.
9. Duct penetrations of walls or decks shall have the annular space between the duct and the structure sealed with approved material.

#### O. DUCTWORK ACCESSORIES

1. Duct Flexible Connections:
  - i. Other than the Lab Hood Exhaust, provide 6 inch metal edge Ventglas or Thermafab flexible connections at fan and unit inlets and outlets. Leave 1 inch minimum slack, (this means 1/2 inch standing fold). Duct openings shall be lined up on either side of flexible connections.
  - ii. Lab Hood Exhaust ductwork flex connector shall be equal to Labconco Flexible Duct Connection. Seal openings with fire resistant caulk.
2. Wire Mesh Screen: 1/2 inch x 1/2 inch 316 series stainless steel welded wire mesh. Brush screen with chemically resistant sealant equal to Ceilcote 242 Flakeline.
3. Volume Dampers
  - i. Provide volume dampers where indicated on the Contract Drawings.
  - ii. Dampers less than 12 inches in height shall be Young Regulator manual adjustable rectangular opposed blade dampers.
  - iii. Dampers 12 inch and larger in height shall be opposed multi-blade equal to Greenheck, Nailor, or Vent Products.

- iv. Damper frame shall be constructed of 316 series stainless steel channel with minimum thickness of .050 inches. Opposed damper blades shall be 316 series stainless steel with minimum thickness of .050 inches and shall include reinforcing ribs. Each blade shall be supported in the damper frame by individual Teflon axle bearings, and shall be driven by stainless steel connecting slide linkage controlled by 3/8 inch square steel control shaft.
- v. Damper blades shall be 2 gauges heavier than adjoining ductwork, and shall be riveting to supporting rods. Hem over edges parallel to rods.
- vi. Brackets shall be galvanized metal, secured to ductwork with sheet metal screw with locking quadrant arms. Provide 2-inch handle extension for all dampers on externally insulated ductwork.

#### 4. Sheet Metal Access Panels

- i. Provide access panels of the proper size and at all locations in ductwork necessary to service control devices, fan bearings and as required to service all systems.
- ii. Access panels shall have foam gasketing, fixed hinges and compression type latches as manufactured by Ventlock, Duro-Dyne or approved equal. Access doors for insulated ducts shall be insulated with 1 inch thick 1 ½ lb density coated duct liner. Panels shall be 316 stainless steel.

#### 5. Diffusers, Registers and Grilles

- i. Supply Grille, Supply Register:
  - a. Minimum 22 gauge type 316 stainless steel construction.
  - b. 1 1/4-inch margins, mitered corners, and countersunk mounting holes.
  - c. Double deflection.
  - d. Vertical front blades and horizontal rear blades.
  - e. Individual adjustable front and rear blades on ¾-inch centers.
  - f. Mill finish.
  - g. Register to be provided with integral opposed blade type 316 stainless steel damper adjustable from face.
  - h. Tuttle & Bailey, T64SS.
- ii. Exhaust Registers, Exhaust Grilles:
  - a. Minimum 22 gauge type 316 stainless steel construction.
  - b. 1 1/4-inch margins, mitered corners, and countersunk mounting holes.
  - c. Fixed vertical zero deflection bars.
  - d. Mill finish.
  - e. Register to be provided with integral opposed blade type 316 stainless steel damper adjustable from face.
  - f. Tuttle & Bailey, T80SS.

#### 6. Control Dampers

- i. Furnish motor operated control dampers for Inlet Louvers and Exit Louver as follows: IL-1: one 24" x 24" damper; IL-2: one 60" x 36" damper; IL-3: one 36" x 24" damper; EL-1: one 36" x 60" damper. Provide direct connected Universal Power Supply damper actuator for each damper.
- ii. Damper Assembly: Damper shall conform to SMACNA HVAC Duct Construction Standards. A single damper section shall have blades no longer than 48 inches and shall be no higher than 72 inches. Maximum damper blade width shall be 8 inches. Larger sizes shall consist of a combination of sections. Damper shall be 316 stainless steel. Flat blades shall be made rigid by folding the edges. Provide blades with compressible seals at points of contact. Provide channel frames of dampers with jamb seals to minimize air leakage. Dampers shall not leak in excess of 10 cfm per square foot at 4 inches water gage static pressure when closed. Seals shall be suitable for an operating temperature range of minus 40 degrees F to 200 degrees F. Dampers shall be rated at not less than 2000 fpm air velocity. Moving parts of operating linkage in contact with each other shall consist of dissimilar materials. Damper axles shall be 0.5 inches minimum plated steel rods supported in the damper frame by stainless steel or bronze bearings. Blades mounted vertically shall be supported by non-ferrous dissimilar thrust bearings. Pressure drop through dampers shall not exceed 0.05 inch water gage at 1,000 fpm in the wide-open position. Frames shall not be less than 2 inches wide. Dampers shall be tested in accordance with AMCA 500-D.
- iii. Operating Links: Operating links external to dampers, such as crank arms, connecting rods, and line shafting for transmitting motion from damper actuators or dampers, shall withstand a load equal to at least twice the maximum required damper-operating force. Rod lengths shall be adjustable. Links shall be 316 stainless steel. Mating parts shall consist of dissimilar materials. Working parts of joints and clevises shall be brass, bronze, or stainless steel. Adjustments of crank arms shall control the open and closed positions of dampers.
- iv. Lab Hood Exhaust Duct Control Damper shall be a round butterfly damper entirely constructed of 316 stainless steel. Damper shall shut off tightly to prevent gravity flow of air through the ductwork. Damper shall be operated by a spring return Universal Power Supply actuator which shall be arranged to fail open upon loss of electrical power.

## P. SLEEVES AND PENETRATIONS

1. Sleeves in Masonry and Concrete Walls, Floors, Ceilings and Flat Roofs: Standard Weight hot-dip galvanized steel, ductile-iron or cast-iron pipe sleeves.
2. Sleeves in Non-Masonry or Non-Concrete Walls without membranes, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.
3. Sleeves in Non-Masonry or Non-Concrete Walls with membranes, Floors, and Roofs: Per wall manufacturers direction.
4. Duct Sleeves and Openings

- i. Sleeves through floors, decks, and through exterior structure, shall be Schedule 40 galvanized steel pipe for round duct. Packing shall be applied to seal any openings between sleeve and wall.
- ii. Openings in walls, partitions and other fire-rated construction that do not require smoke dampers shall meet NFPA 90A, Section 3-3.8.
- iii. Materials for prepared openings in partitions shall match construction penetrated.

#### 5. Pipe Sleeve Packing

- i. Packing between the pipe and the sleeve (or wall or slab opening) shall be a combination of insulation and caulk. Fiberglass shall not be used as the insulation material.
- ii. Packing for sleeves that do not require maintenance of fire rating shall be oakum, silicate foam, ceramic fiber or mineral fiber with approved sealant. Pack or foam to within 1" of both wall surfaces. Seal penetration packing with approved caulking and paintable water-proof mastic surface finish or silicone caulking.
- iii. All materials must be installed in accordance with manufacturers instructions; all gaps must be sealed. Finish caulk flush with wall or slab surface if piping runs exposed.

### Q. MOTORS AND DRIVES

1. Motors shall be totally enclosed (TEFC) and conform to applicable sections of Division 16.
2. Drives for belted motors shall be as manufactured by Dodge Manufacturing Company, Browning Manufacturing Company, T.B. Woods Company or approved equal with adjustable motor sheaves and adjustable sliding bases where applicable. The drive belts shall be as short as practicable. V-belt drives for all fans and fan units shall be sized for 150% of the design drive capacity. All multiple belt drives shall have matched sets of belts.

### R. VIBRATION ISOLATION

#### 1. Manufacturer Responsibility

- i. Manufacturer of vibration equipment shall have the following responsibilities:
  - a. Guarantee specified isolation system deflections.
  - b. Provide installation instructions, drawings and field supervision to ensure proper installation and performance of systems.

#### 2. Quality Assurance

- i. All vibration isolators shall have calibration markings or some method to determine adjustment, the actual deflection under the imposed load after installation and adjustment.
- ii. All isolators shall operate within the linear position of their load vs. deflection curves. Load vs. deflection curves shall be furnished by the manufacturer and must be linear over a deflection range of not less than 50% above the design deflection.
- iii. The theoretical vertical natural frequency for each support point, based upon load per isolator and isolator stiffness, shall not differ from the design objectives for the equipment as a whole by more than  $\nabla 10\%$ .
- iv. Substitution of internally isolated equipment in lieu of the isolation specified in this section, is acceptable provided all conditions of this section are met. The equipment manufacture shall provide a letter of guarantee stating that the specified noise and vibration levels will be obtained or the cost of converting to the specified external vibration isolation shall be born by the equipment manufacturer.
- v. The following specifications describe spring hanger with 30 degree misalignment feature. This requirement is mandatory. Replace any hangers without the 30 degree capability at no additional cost to the Owner.

### 3. Description

- i. All vibration isolation devices shall be the product of a single manufacturer. Products of other manufacturers are acceptable provided their systems strictly comply with intent, structural design, performance, and deflections of the base manufacturer.
- ii. Acceptable manufacturers of vibration isolation products shall be: Mason Industries, Amber Booth Company, Peabody Noise Control, Korfund Dynamics Corporation, Vibration Mountings and Equipment, Vibration Eliminator Co., provided they meet the requirements of the Specifications. Mason Industries model numbers have been used in the Specifications to establish quality of components but are in no way to limit competitive bidding by other manufacturers.
- iii. Refer to Table A at the end of this Article for application of the various types listed to appropriate equipment and efficiency level.

### 4. Vibration Isolation Types

- i. Vibration Isolators
  - a. Type A: Spring Isolator
    - 1) Having a minimum OD to OH of 0.8:1.
    - 2) Springs cadmium plated.
    - 3) Hardware cadmium plated.
    - 4) All other metal parts hot-dip galvanized.
    - 5) Reserve deflection (from loaded to solid height) of 50% of rated deflection.

- 6) Minimum ¼ inch thick neoprene acoustical base pad on underside.
- 7) Designed and installed so that ends of springs remain parallel.
- 8) Non-resonant with equipment forcing frequencies or support structure natural frequency.

b. Type E: Elastomer hanger rod isolator.

- 1) Molded (min. 1 ¾ inch thick) neoprene element with projecting bushing lining the rod clearance hole. Static deflection at rated load shall be a minimum of 0.35 inches.
- 2) Steel retainer box encasing neoprene mounting capable of supporting equipment up to four times the rated capacity of the element.

c. Type F: Combination spring/elastomer hanger rod isolator.

- 1) Spring and neoprene elements in a steel retainer box with the features as described for Type A and E isolators.

d. Type J: Steel Rails.

- 1) Steel members of sufficient strength to prevent equipment flexure during operation.
- 2) Height saving brackets as required to reduce operating height and cradle the unit.

5. Execution

i. General

- a. Isolation systems shall be installed in strict accordance with the manufacturer's written instructions. Vibration isolator shall not cause any change of position of equipment resulting in stress on equipment connections.

b. Equipment Installation

- 1) Equipment shall be isolated as per Table A below.
- 2) Additional requirements:
  - a) After the entire installation is complete, and under full operational load, the isolators shall be properly adjusted. Verify that there are no short circuits of the isolation. The equipment shall be free in all directions.
  - b) Install equipment with flexibility in wiring.

TABLE A

Equipment	MTNG	ISOL	DEFLECTION in inches	BASE

Dehumidifier	Flr	A	0.75	J
In-Line Fans	Flr	A	0.75	
Unit Heaters	Clg	E	0.30	
Heat Pump	Clg	E	0.30	
Air Cooled Condenser	Flr	A	0.75	J

NOTES:

1. "ISOL" and "BASE" column indicates letter type as it appears in the Specifications.
2. "MTNG" refers to method of support of equipment from the structure.

S. INSULATION

1. All insulation, adhesives, tape, etc. shall conform to NFPA 90A. No voids in insulation will be permitted.
2. Pipe insulation shall be as specified in Table 1 and Table 2.

TABLE 1  
INSULATION MATERIAL FOR PIPING

Service	Material	Spec	Type	Class	Vapor Barrier Required
A/C Refrigerant Liquid & Suction	Mineral Fiber	ASTM C		1	Yes
	Cellular Glass	547	II	2	No
	Flexible Cellular	ASTM C	I		No
	Faced Phenolic	552	III		Yes
	Foam	ASTM C 534 ASTM C 1126			
Emergency Generator Exhaust (As applicable)	Calcium Silicate				No

TABLE 2  
PIPING INSULATION THICKNESS (INCH)

Service	Material	Tube and Pipe Size (Inches)		
		< 1	1 < 1- 1/2	1 1/2 -4
	Mineral Fiber			

Service	Material	Tube and Pipe Size (Inches)		
		< 1	1 < 1- 1/2	1 1/2 -4
A/C Refrigerant Liquid & Suction	Cellular Glass Flexible Cellular Faced Phenolic Foam	1	1.5	1.5
Emergency Generator Exhaust, Piping, Fittings and Muffler. (As applicable)	Calcium Silicate	4" thick minimum all pipe sizes -rated for 1200 Deg F.		

3. Insulation indoors shall have all-purpose jacket.
4. Insulation outdoors and exposed indoors within six feet of floors shall have a protective jacket. Jacket shall be fabricated from 0.016" thick aluminum and shall be fastened with stainless steel clamps.
5. Generator exhaust insulation shall have staggered joints. Secure with 1/2" wide 0.015" thick stainless steel bands on 12" centers.
6. Duct Insulation
  - i. Cover outdoor air intake ducts and plenums between the wall cap and the wire mesh screen outlets. Cover outdoor air intake duct from wall cap to HP-1. Cover exhaust air ducts and plenums between the control damper and the outdoors. Cover outdoor air intake duct, including but not limited to, all the intake ductwork to MUA-1, including the plenum. Cover supply air ducts in their entirety, including but not limited to, MUA-1, DHU-1 and DHU-2. Insulate to R-12.
  - ii. Insulate ducts with Johns-Manville 0.75 lb Microlite with FSK facing (foil-skrim-kraft) complete with vapor barrier, with an installed R-value of 12 and a thermal conductivity of 0.27. Longitudinal and circumferential joints shall be sealed with 2 inch wide self-sealing FSK strips. Additionally the insulation shall be adhered to the bottom of all ducts over 12 inches wide with "Stick-Clips" spaced not more than 12 inches on center.

#### T. GAS FIRED EQUIPMENT VENTS

1. All gas fired appliance vents and combustion air inlets shall be furnished and installed by the Plumbing FSB. Combination combustion air and vent concentric vent fittings furnished as part of gas-fired appliances under the HVAC specifications shall be provided to the Plumbing FSB for installation as part of the gas vent installation.

#### U. REFRIGERANT MONITORING AND DETECTION (SINGLE POINT)

1. Provide a refrigerant sensitive infra red sensor based stationary refrigerant gas leak monitor system designed to measure the level of a single refrigerant gas compound (R-407C is basis of design – HVAC FSB to confirm before ordering) in a single monitoring area. (In this case monitored area is the PFAS/FEMN space.) Monitor shall be Bachrach 3015-4200 HGMSZ or approved equal. The monitor equipment shall be a single area, self-contained wall mounted device, recommended for installation 3 feet above the floor located in the air flow path of the area where refrigerant gases are most likely to concentrate. Monitoring system shall support compliance with ANSI/BSR ASHRAE 15-2019 Mechanical Safety Code requirements.
2. The monitor shall automatically and continuously monitor for the selected refrigerant gas. The installing contractor shall furnish, install and connect a 12 inch ½” diameter stainless steel sample tube and a 12 inch ½” diameter stainless steel exhaust tube at the monitor to sense refrigerant leaks. Separate sample and exhaust tubes as directed by installation instructions.
3. The monitor shall be sensor type with factory calibrated settings for the selected refrigerant. Measurement range for the refrigerant gas selected shall be as follows: 2,500 ppm, with an accuracy as a percentage of full scale in ambient temperature ranges of 32 degrees F to 120 degrees F, and 5% to 90% ambient humidity, (non-condensing).
4. The monitor shall be equipped with dry contacts, and indicator lights. Alarm operation shall be as follows:
  5. Low Alarm 500 ppm detection: The LED flashes red at 0.5 hz and the buzzer sounds. The dry contact closes and Exhaust Fan 5 is started and the associated inlet louver control damper is opened.
  6. High Alarm 2000 ppm detection: The LED flashes red at 2 hz and the buzzer sounds. See Electrical specifications for controls connections to building data system.
7. Unit power consumption shall be less than 20 Watts maximum and power supply shall be 100 to 240 volts AC 60 Hz. 24 VAC power supply monitor/detectors will not be accepted.
8. The monitor will have a warranty period of one (1) year from the date of shipment from the manufacturer covering defects in material and workmanship and ninety (90) days labor from date of shipment within the continental United States.
9. The enclosure size shall not be larger than will fit on than a three-gang electrical box.
10. The monitor system shall require no periodic maintenance other than periodic checking and verification of accuracy. Periodic checking or adjustments of the unit shall be capable of being accomplished by one person at the unit location.

## V. AUTOMATIC CONTROLS

1. The HVAC FSB shall provide electric automatic control devices as indicated on the drawings and in these specifications.
2. Provide control dampers, damper actuators and thermostats.
3. Furnish and install Operator Station for EF-6.
4. Furnish and install Refrigeration Monitor for control of EF-5.
5. HVAC Contractor is responsible to carry the cost for the interconnecting wiring and conduit materials and labor between the Lab Hood Exhaust Fan VFD, Hood Management System, and the MUA unit supply fan control as part of the bid spec. See paragraph 9 for additional detail.
6. Install:
  - i. Duct smoke detector for DHU-1 and 2.
  - ii. Packaged controllers for HP-1, DHU-1 and DHU-2.
  - iii. Packaged duct sensors, etc. for DHU-1 and DHU-2.
7. Submittals
  - i. The following shall be submitted for approval:
    - a. Data sheets for control system components.
8. Instruction and Adjustment
  - i. Upon Completion of the Work, the HVAC FSB shall:
    - a. Completely adjust and ready for use: thermostats, controllers, actuators and other components and equipment provided under this section.
    - b. Furnish operation and maintenance manuals covering function and operation of control systems on project for use by Owner's operating personnel. Competent technician shall be provided for instruction purposes.
    - c. Provide adequate instruction (not less than 2 hours) to the Owners personnel by means of a competent technician. Obtain written confirmation from the Owner that adequate instructions for each system has been provided in an acceptable manner.
9. **All wiring, wiring connections and rigid conduit shall be provided by DIVISION 16 - ELECTRICAL. Conduit and wiring for power connections will be provided under DIVISION 16 - ELECTRICAL.**
10. Provide components factory ordered for this project. Rebuilt equipment, warehoused equipment, or earlier generation equipment shall not be acceptable.

Electrical and electronic devices not located within control panels shall have a NEMA 250 Type 4X enclosure in accordance with NEMA 250 unless otherwise indicated on the Contract Drawings. Actuators and transmitters shall operate within temperature limit ranges of plus 35 to 150 degrees F. Panel mounted instruments shall operate within limit ratings of 35 to 120 degrees F and 10% to 95% relative humidity, non-condensing. Devices installed outdoors shall operate within limit ratings of minus 35 to 150 degrees F.

11. Actuators. Actuators shall function as required within 80% to 110% of their power supply rating. Actuators shall fail to their spring return positions on signal or power failure and shall have visible position indicators. Actuators shall open or close the devices to which they are applied within 60 seconds after a full scale signal input change. Actuators shall be Universal Power Supply type that may be powered an electrical supply ranging from 24 to 240 VAC at 60 hz. Provide electric spring return actuators with NEMA 4X enclosures suitable for installation in corrosive environments.
  - i. Damper actuators shall be rated for at least 125% of the motive power necessary to operate the connected damper. The actuator stroke shall be limited by an adjustable stop in the direction of the return stroke. Actuators shall be provided with mounting and connecting hardware.

## 12. Thermostats

- i. Fan thermostats shall be electric cooling type, 1-stage. Contacts shall be double-pole single-throw (DPST), 20-amp, 120-volt, hermetically sealed, and wired to identified terminals. Thermostat covers shall consist of locking metal, and shall be capable of being locked by an Allen wrench or special tool. Thermostats shall have manual switches as required by the application and a minimum range of 45 to 90 degrees F.
- ii. Gas Fired Unit heater thermostats shall be electric 2-stage 4 wire connected to a terminal strip in the UH. Contacts shall be double-pole single-throw (DPST), 20-amp, 24-volt, hermetically sealed, and wired to identified terminals. Thermostat covers shall consist of locking metal, and shall be capable of being locked by an Allen wrench or special tool. Thermostats shall have a minimum range of 45 to 90 degrees F.
- iii. Electric Unit heater thermostats shall be electric 1-stage connected to a terminal strip in the UH. Contacts shall be double-pole single-throw (DPST), 20-amp, 24-volt, hermetically sealed, and wired to identified terminals. Thermostat covers shall consist of locking metal and shall be capable of being locked by an Allen wrench or special tool. Thermostats shall have manual switches as required by the application and a minimum range of 45 to 90 degrees F.
- iv. Electric Wall Heater thermostats; if not integral to the unit; shall be electric 1-stage connected to a junction box in the EBB. Contacts shall be single-pole single-throw.

## W. CONTROL SEQUENCES

1. Control sequences of operation shall be as indicated on the Contract Drawings.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install all items specified under this section according to the manufacturer's requirements, shop drawings, the details as shown on the Contract Drawings and/or as specified.
- B. Install all Work so that parts requiring inspection, replacements, maintenance and repair shall be readily accessible. Minor deviations from the Contract Drawings may be made to accomplish this, but any substantial change shall not be made without prior written approval from the Engineer.
- C. Equipment bases mounted on concrete slabs and pads, or mounted on stands, gratings, platforms, or other, shall not be set in any manner, except on the finished and permanent support.
- D. Support of equipment on studs or other means, and the placing or building of the supporting slab, pad, pier, stand, grating, or other "to the equipment", is prohibited.
- E. Concrete supporting structures shall have been constructed and cured a minimum of 14 days before equipment is mounted.

### F. OPENINGS

1. The responsibility for determining the exact size and location of openings is part of the Work of this section. If this responsibility is not met, cutting and patching to achieve the correct size and location of openings and chases is part of the work of this section. **As part of this responsibility the HVAC FSB shall produce a layout plan for review and approval of the Architect and Engineer prior to cutting of openings.**

### G. CUTTING AND PATCHING

1. **Masonry FSB shall be responsible to handle interior openings, including cutting and patching.** Cutting and patching of masonry walls, partitions, ceilings and floors is included. Concrete cutting shall be done with abrasive wheels or saws, and coring with a diamond core bit. Jackhammers are prohibited.

### H. CONNECTIONS TO EQUIPMENT

1. Connections shall be provided by the HVAC FSB unless otherwise indicated. Unless otherwise indicated, the size of the connections to each piece of equipment shall be not smaller than the connections on the equipment. No bushed connections shall be permitted. Change in sizes shall be made with reducers or increasers only.

### I. SUPPORTS

1. General

- i. Hangers used to support piping 2 inches and larger shall be fabricated to permit adequate adjustment after erection while supporting the load.

#### J. PIPE HANGERS AND SUPPORTS

1. Pipe hangers and supports shall conform to MSS SP-58 and MSS SP-69, except as specified as follows:
  - i. Types 5, 12, and 26 shall not be used.
  - ii. Type 3 shall not be used on insulated pipe which has a vapor barrier. Type 3 may be used on insulated pipe that does not have a vapor barrier if clamped directly to the pipe and if the clamp bottom does not extend through the insulation and the top clamp attachment does not contact the insulation during pipe movement.
  - iii. Type 19 and 23 C-clamps shall be torqued per MSS SP-69 and have both locknuts and retaining devices, furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.
  - iv. Type 20 attachments used on angles and channels shall be furnished with an added malleable iron heel plate or adapter.
  - v. Type 24 may be used only on trapeze hanger systems or on fabricated frames.
  - vi. Horizontal pipe supports shall be spaced as specified in MSS SP-69 and a support shall be installed not over 1 foot from the pipe fitting joint at each change in direction of the piping. Pipe supports shall be spaced not over 5 feet apart at valves.
  - vii. Vertical pipe shall be supported at intervals of not more than 15 feet, except that pipe shall be supported not more than 8 feet from end of risers, and at vent terminations.
  - viii. Except for Type 3, pipe hangers on horizontal insulated pipe shall be the size of the outside diameter of the insulation.

#### K. PIPE EXPANSION

1. The expansion of pipes shall be provided for by changes in the direction of the run of pipe.

#### L. REFRIGERATION SYSTEMS PIPING INSTALLATION

1. Refrigeration Piping and Accessories
  - i. Unless otherwise specified, pipe and fittings installation shall conform to requirements of ASME B31.5. Pipe shall be cut accurately to measurement established at the jobsite and worked into place without springing or forcing. Cutting or otherwise weakening of the building structure to facilitate piping installation will not be permitted without written approval. Pipes shall be cut square, shall have burrs removed by reaming, and shall be installed in a manner to permit free expansion and contraction without damage to joints or

hangers. Filings, dust, or dirt shall be wiped from interior of pipe before connections are made.

## 2. Directional Changes

- i. Changes in direction shall be made with fittings, except that bending of pipe 4 inches and smaller will be permitted, provided a pipe bender is used and wide-sweep bends are formed. The centerline radius of bends shall not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, or other malformations will not be accepted.

## 3. Functional Requirements

- i. All piping shall be pitched down 1/2 inch per 10 feet of pipe toward the compressor to ensure adequate oil drainage. Open ends of refrigerant lines or equipment shall be properly capped or plugged during installation to keep moisture, dirt and other foreign material out of the system. Piping shall remain capped until installation. Equipment piping shall be in accordance with the equipment manufacturer's recommendations and the Contract Drawings.

## 4. Filter Dryer

- i. A liquid line filter dryer shall be provided on each refrigerant circuit located such that all liquid refrigerant passes through a filter dryer. The filter dryer shall be sized in accordance with the manufacturer's recommendations for the system in which it is installed. The filter dryer shall be installed such that the filter dryer can be isolated from the system, the isolated portion of the system evacuated, and the filter dryer replaced. Filter dryers shall be installed in the horizontal position except replaceable core filter dryers may be installed in the vertical position with the access flange on the bottom.

## 5. Sight Glass

- i. A moisture indicating sight glass shall be installed in all refrigerant circuits down stream of all filter dryers.

# M. REFRIGERATION SYSTEMS TESTS

## 1. Field Tests

- i. The services of a qualified technician shall be provided as required to perform all tests and procedures indicated herein.
- ii. Refrigerant Pipe Testing
  - a. Refrigerant Leakage Test: After all components of the refrigerant system have been installed and the piping connected, the system shall be subjected to a refrigerant leakage test. The refrigerant leakage test shall be done with dry nitrogen before any refrigerant pipe is insulated or covered. High and low side of the refrigerant system shall be tested for

the minimum refrigerant leakage test pressure specified in ASHRAE 15, for the refrigerant employed in the system. System shall be proved tight and free of leaks by allowing the refrigerant leakage test pressure to remain on the system for 24 hours with no drop in pressure. The initial test pressure and surrounding air temperature will be recorded. After the 24 hour hold period, the final system pressure and surrounding air temperature will be recorded. A correction of 0.3 psi shall be allowed for each degree C (F) change in the initial and final temperature of the surrounding air, plus for an increase and minus for a decrease. The system shall have passed the refrigerant leakage test if the corrected final system pressure is equal to the initial system test pressure. If the pressures are not equal, the leaks shall be located and repaired.

- b. Refrigerant Leaks: To repair leaks, the joint shall be taken apart, thoroughly cleaned, and remade as a new joint. Joints repaired by caulking or re-melting and adding more brazing material will not be acceptable. After leak repairs have been made, the refrigerant leakage test shall be conducted again.
- c. System Charging and Startup Test: Following satisfactory completion of the evacuation tests, the system shall be charged with the required amount of refrigerant by raising pressure to normal operating pressure and in accordance with manufacturer's procedures. Following charging, the system shall operate with high-side and low-side pressures and corresponding refrigerant temperatures, at design or improved values. The entire system shall be tested for leaks. Fluorocarbon systems shall be tested with halide torch or electronic leak detectors.
- d. Evacuation Test: After the foregoing tests have been satisfactorily completed and the pressure relieved, entire system shall be evacuated to an absolute pressure of 300 microns. During evacuation of the system, the ambient temperature shall be higher than 35 degrees F. Vacuum line shall be closed, and the system shall stand for 1 hour. After this period, the absolute pressure shall not exceed 500 microns. If the pressure rises over 500 microns, the system shall continue to be evacuated until the system reaches 300 microns and can stand for 1 hour with the vacuum line closed without the absolute pressure rising over 500 microns. During evacuation, pressures shall be recorded by a thermocouple type, electronic type, or a calibrated-micron type gauge.

### iii. System Performance Tests

- a. After the foregoing tests have been completed and before each refrigeration system is accepted, tests to demonstrate the general operating characteristics of all equipment shall be conducted by a registered professional engineer or an approved manufacturer's startup representative experienced in system startup and testing, at such times as directed. Tests shall cover a period of not less than 5 days for each system and shall demonstrate that the entire system is functioning in accordance with the drawings and specifications. Corrections and adjustments shall be made as necessary and tests shall be re-conducted to demonstrate that the entire system is functioning as specified.

## N. DUCTWORK

1. Installation shall be according to SMACNA HVAC DUCT CONSTRUCTION STANDARDS, latest edition unless otherwise indicated. Duct supports for sheet metal ductwork shall be according to SMACNA HVAC DUCT CONSTRUCTION STANDARDS, latest edition unless otherwise specified. Friction beam clamps indicated in SMACNA HVAC DUCT CONSTRUCTION STANDARDS, latest edition unless otherwise indicated shall not be used. Supports shall be attached only to structural framing members. Supports shall not be anchored to metal decking unless a means is provided and approved for preventing the anchor from puncturing the metal decking. Where supports are required between structural framing members, suitable intermediate metal framing shall be provided. Where C-clamps are used, retainer clips shall be provided.
2. Dust Control
  - i. To prevent the accumulation of dust, debris and foreign material during construction, temporary dust control protection shall be provided. The distribution system (supply and return) shall be protected with temporary seal-offs at all inlets and outlets at the end of each day's Work. Temporary protection shall remain in place until system is ready for startup.

## O. POWER TRANSMISSION COMPONENTS ADJUSTMENT

1. V-belts and sheaves shall be tested for proper alignment and tension prior to operation and after 72 hours of operation at final speed. Belts on drive side shall be uniformly loaded, not bouncing. Alignment of direct driven couplings shall be to within 50 percent of manufacturer's maximum allowable range of misalignment.

## P. TAGS

1. Upon completion of work, attach engraved laminated tags to all valves (listed in the valve directory called for in the "Bulletins, Manuals and Instructions" paragraph of these specifications) and all pieces of HVAC equipment (including but not limited to pumps, fans, air handlers, coils and all other equipment listed in the HVAC schedules). Valve tags shall have black characters on white face, consecutively numbered and prefixed by letter "V". Equipment tags shall have black characters on white face, with labels corresponding to drawing schedule numbers.
2. Embossed or engraved aluminum or brass tags may be substituted if desired. Tags shall be at least 1/8" thick.
3. Valve tags shall be at least 1" in diameter with numerals at least 3/8" high and attached by "S" hooks or chains. Equipment tags shall be at least 2" diameter securely attached to apparatus.

4. Provide manufacturers equipment nameplates, catalog numbers and rating identification securely attached to electrical and mechanical equipment with screws or rivets. Adhesives or cements will not be permitted.

**Q. PIPE AND DUCT IDENTIFICATION**

1. Ductwork shall be stenciled at each junction or branch takeoff, at least once in each room, and at intervals not longer than 20 ft. Stencil shall clearly identify duct service (S for supply, R for return, X for exhaust), area served by branch, and arrow indicating direction of flow.
2. Provide color-coded pipe identification markers on piping installed under this Section. Pipe markers shall be snap-on laminated plastic protected by clear acrylic coating. Pipe markers shall be applied after architectural painting where such is required.
3. Provide arrow marker with each pipe content marker to indicate direction of flow. If flow can be in either direction, use double-headed arrow marker.
4. Mains shall be labeled at points of entrance and exit from mechanical room, adjacent to each valve, on each riser, at each tee fitting, at points of entrance and exit from building, at least once in each room, and at intervals no longer than 20 ft.
5. Size of legend letters on markers and length of color field shall be per the latest edition of ANSI A13.1.
6. Markers shall be "Setmark" by Seton Name Plate Corp. or approved equal.
7. Following color coding shall be used with names in black letters on yellow background and white letters on green background:

Service	Legend	Background Color
Refrigerant	Refrigerant	Yellow
Condensate	Condensate	Yellow

8. Color banding shall meet latest edition of ANSI A13.1 and OSHA.

**R. AIR SYSTEMS BALANCING**

1. Balancing shall be performed in compliance with the standards listed in paragraph 1.8.E.8. The building shall be essentially complete with final ceiling, walls, windows, doors and partitions in place. Doors and windows surrounding each area to be balanced shall be closed during testing and balancing operations. Air systems shall be complete and operable with registers, ducting, diffusers, returns, and control components in place. Fans shall be operational. Air motion and distribution from air terminals shall be as shown. All data including deficiencies encountered and corrective action taken shall be recorded. If a system cannot be adjusted to meet the design requirements, promptly notify the Engineer in writing.

## 2. Air Systems

- i. Each system shall be adjusted until all flow quantities are within plus 10% and minus 0%. Dampers shall be checked for tight shutoff. Air leakage around dampers shall be verified. Fans shall be checked for correct direction of rotation and proper speed shall be verified.

## 3. General Balancing Methods

- i. Air flow adjustments shall be made by first adjusting the fan speed to meet the design flow conditions. Flows shall be checked at all supply and exhaust outlets. All flows shall be recorded before and after each adjustment.  
**NOTE: Lab Exhaust Hood to be balanced to between 1260 to 1200 cfm at full airflow. Makeup Air Unit to be balanced to approximately 90% of Lab Exhaust Hood airflow or 1100 to 1045 cfm at MUA Unit design airflow.**

## 4. Control Systems

- i. Testing, adjusting, and balancing of the systems shall be coordinated with the control system installation. All control components shall be verified to be properly installed and operating as specified before proceeding with testing, adjusting, and balancing. Verification shall be in accordance with AABC MN-1.
- ii. Adjustment of the temperature controls shall be coordinated by the person in charge of the balancing and adjusting and shall be performed coincidental therewith. Simulate a complete cycle of operation for each system.

## S. BASES AND SUPPORTS

1. As part of paragraph 1.25 SUPPLEMENTARY STEEL, provide all bases and supports not part of the building structure, of required size, type, and strength, as approved by the Engineer, for all equipment and materials furnished by him. All equipment, bases and supports shall be adequately anchored to the building structure to prevent shifting of position under operating conditions.
2. All concrete foundations and all concrete supports will be provided by the General Contractor. Furnish shop drawings and templates for all concrete foundations and supports for setting all required hanger and foundation bolts and other appurtenances necessary for the proper installation of his equipment.
3. NOTE: The Dehumidifier and the Air Cooled Condenser must have no more than a 10 foot vertical lift from the Condenser to the Dehumidifier. Furnish sufficient steel dunnage to raise the Condenser and the support stand above the concrete support pad to comply with the 10 foot limitation. Anchor support steel and stand securely to withstand wind and seismic forces.

## T. SUPPLEMENTAL STEEL FABRICATION AND INSTALLATION

1. All Work shall be cut, assembled, welded and finished by skilled mechanics. Welds shall be ground smooth. Stands, brackets, and framework shall be properly sized and firmly constructed.
2. Measurements shall be taken on the job and worked out to suit adjoining and connecting Work. All Work shall be by experienced metal working mechanics. Members shall be straight and true and accurately fitted. Scale, rust, and burrs shall be removed. Welded joints shall be ground smooth where exposed. Drilling, cutting and fitting shall be done as required to properly install the work and accommodate the work of other trades as directed by them.
3. Members shall be generally welded, except that bolting may be used for field assembly where welding would be impractical.
4. All shop fabricated iron and steel work shall be cleaned and dried and given a shop coat of paint on all surfaces and in all openings and crevices. Field fabricated iron and steel work shall be given prime and finish coats of paint after installation.

#### U. PLACING IN SERVICE

1. At the completion of performance tests and following approval of test result, recheck all equipment to see that each item is adequately lubricated and functioning correctly.

#### V. CLEANING AND ADJUSTING

1. During the progress of the Work, clean up and remove all oil, grease, and other debris caused by the Work performed under this section.
2. At the conclusion of the Project, clean and repair all areas and finishes as installed or affected by this installation of Work under this section.
3. Equipment
  - i. Equipment shall be wiped clean, with all traces of oil, dust, dirt, or paint spots removed. System shall be maintained in this clean condition until final acceptance. Bearings shall be properly lubricated with oil or grease as recommended by the manufacturer. Belts shall be tightened to proper tension.

#### W. INSULATION

1. Application - General
  - i. Installation
    - a. Except as otherwise specified, material shall be installed in accordance with the manufacturer's written instructions. Insulation materials shall

not be applied until tests specified in other sections of the Specifications are completed. Material such as rust, scale, dirt and moisture shall be removed from surfaces to receive insulation. Insulation shall be kept clean and dry. Insulation shall not be removed from its shipping containers until the day it is ready to use and shall be returned to like containers or equally protected from dirt and moisture at the end of each workday. Insulation that becomes dirty shall be thoroughly cleaned prior to use. If insulation becomes wet or if aforementioned cleaning does not restore the surfaces to like new condition, the insulation may be rejected, and if rejected, shall be immediately removed from the jobsite. Joints shall be staggered on multilayer insulation.

- ii. Pipe insulation shall be as follows:
    - a. Do not insulate the following:
      - 1) Unions
      - 2) Flexible connectors
    - iii. Pipe insulation shall be continuous and installed on fittings and appurtenances unless specified otherwise. Installation shall be with full length units of insulation and using a single cut piece to complete a run. Cut pieces or scraps abutting each other shall not be used.
2. Insulation (Except Flexible Cellular and Calcium Silicate Insulation):
- i. Place sections of insulation around pipe and joints tightly butted into place. Draw jacket tight and smooth. Secure jacket with fire resistant adhesive, factory-applied self-sealing lap, or stainless-steel outward clinching staples spaced not over 4 inches on center and 1/2 inch minimum from edge of lap. Cover circumferential joints with butt strips, not less than 3 inches wide, of material identical to jacket material. Overlap longitudinal laps of jacket material not less than 1 1/2 inches. Adhesive used to secure butt strip shall be same as that used to secure jacket laps. Apply staples to both edges of butt strips.
  - ii. Vapor Barrier Jacket: When a vapor barrier jacket is required, as indicated in Table 1, on ends of sections of insulation that butt against flanges, unions, valves, fittings, and joints, provide a vapor barrier coating or manufacturer's weatherproof coating for outside service unless pipe is supplied with factory-applied self-seal lap. Apply vapor barrier coating at longitudinal and circumferential laps. Patch damaged jacket material by wrapping a strip of jacket material around the pipe and cementing, stapling, and coating as specified for butt strips. Extend patch not less than 1 1/2 inches past the break in both directions. At penetrations by pressure gages, thermometers, etc. fill voids with vapor barrier coating for outside service. Seal with a brush coat of the same coating.
  - iii. Metal Covers: Provide metal covers on insulated piping that is within 6 feet of the finished floor. Secure covers with ss banding.

### 3. Flexible Cellular Insulation

- i. Flexible cellular pipe insulation shall be tubular form. Sweat fittings shall be insulated with miter cut pieces the same size as on adjacent piping.
- ii. Bond cuts, butt joints, ends, and longitudinal joints with adhesive. Miter 90-degree turns and elbows, tees, and valve insulation. Insulate flanges, unions, valves, and fittings in accordance with manufacturer's published instructions. Apply two coats of finish as recommended by insulation manufacturer to flexible unicellular insulation in outside locations. Do not use vinyl lacquer finish or equivalent. Provide flexible cellular insulation for outdoor use with ultraviolet (UV) resistant coating.

### 4. Cellular Glass and Calcium Silicate Insulation

- i. Provide in accordance with manufacturer's printed instructions.

### 5. Hangers and Anchors

- i. Insulation, whether hot or cold application, shall be continuous through hangers. All horizontal pipes 2 inches and smaller shall be supported on hangers with the addition of a Type 40 protection shield to protect the insulation in accordance with MSS SP-69 whenever insulation shows signs of being compressed, or when the insulation or jacket shows visible signs of distortion at or near the support shield, insulation inserts as specified below for piping larger than 2 inches shall be installed. Where pipe is supported by insulation, provide galvanized steel shields or protection saddles.
- ii. Where shields are used on pipes 2 inches and larger, provide insulation inserts at points of hangers and supports. Insulation inserts shall be of calcium silicate, cellular glass, molded glass fiber, all minimum 8 pounds per cubic foot, or other approved material of the same thickness as adjacent insulation. Insulation inserts shall cover bottom half of pipe circumference and be not less in length than the protection shield. Vapor-barrier facing of insert shall be of same material as facing on adjacent insulation. Seal inserts into insulation with vapor barrier coating or weatherproof coating as applicable.
- iii. Where protection saddles are used, fill voids with same insulation material as used on adjacent pipe. Protection saddles shall not be used on piping carrying medium less than 60 degrees F.
- iv. Where anchors are secured to piping carrying medium less than 60 degrees F that is to be insulated, insulate anchors same as piping for a distance not less than four times the insulation thickness to prevent condensation. Vapor seal insulation around anchors.
- v. Inserts shall be covered with a jacket material of the same appearance and quality as the adjoining pipe insulation jacket, shall overlap the adjoining pipe jacket 1-1/2 inches, and shall be sealed as required for the pipe jacket. The jacket material used to cover inserts in flexible cellular insulation shall conform to ASTM C 921, Type 1, and is allowed to be of a different material than the adjoining insulation material.

### 6. Sleeves and Wall Chases

- i. Where interior wall is penetrated, extend aluminum jacket 2 inches out on either side of wall and secure on each end with a band. Where floor is penetrated, extend a aluminum jacket from a point below back-up material to a point 10 inches above floor with one band at the floor and one not more than one inch from end of metal jacket. Where exterior wall is penetrated, extend aluminum jacket through sleeve to a point 2 inches beyond interior surface of wall.
- ii. Pipe insulation shall be continuous through the sleeves.
- iii. An aluminum jacket with factory applied moisture barrier shall be provided over the insulation wherever penetrations require sealing.

#### 7. Flanges, Unions, Valves and Fittings for Piping

- i. Factory fabricated removable and reusable insulation covers may be used except with flexible cellular insulation. When nesting size insulation is used, overlap 2 inches or one pipe diameter, whichever is larger. Use insulating cement to fill voids. On pipe sizes larger than 2-1/2 inches, elbow insulated using segments shall not have less than three segments per elbow. Place and join segments with manufacturer's recommended water-vapor resistant, fire retardant adhesive appropriate for the temperature limit of the service. Overlap tape seams one inch. Total dry film thickness shall be not less than 1/16 inch. Unions are not to be insulated; taper insulation to union at a 45 degree angle. Provide finish coating as follows:
  - a. Coating with Embedded Glass Tape: Coat insulation and all purpose jacket with two coats of lagging adhesive and with glass tape embedded between coats. Total dry film thickness shall not be less than 1/16 inch. For cold piping, seal insulation and jacket with two coats of vapor barrier coating with glass tape embedded between coats. Insulate anchors attached directly to cold pipe for a sufficient distance to prevent condensation but not less than 6 inches from insulation surface.
  - b. PVC Fitting Covers: Factory premolded one-piece PVC fitting covers may be provided in lieu of two coats of adhesive with tape embedded between coats. Provide factory premolded field-fabricated segment or blanket insert insulation under fitting covers. Install factory premolded one-piece PVC fitting covers over insulation. Secure covers with stapling, taping with PVC vapor barrier tape, or with metal or plastic tacks made for securing PVC fitting covers. Do not provide PVC fitting covers where exposed to weather. Provide PVC fitting covers only in ambient temperatures below 150 degrees F.

## 8. Duct and Plenum Insulation Installation

- i. Insulate plena and ductwork between the motorized damper and the exterior louver.
- ii. Insulation shall be attached by applying Class 2 adhesive around the entire perimeter of the duct in 6 inch wide strips on 12 inch centers.
- iii. For ducts and plena, 24 inches and larger insulation shall be additionally secured to bottom of ducts by the use of mechanical fasteners. Fasteners shall be spaced on 18-inch centers and not more than 18 inches from duct corners.
- iv. Insulation shall be impaled on the mechanical fasteners where used and shall be pressed thoroughly into the adhesive. Care shall be taken to ensure vapor barrier jacket joints overlap 2 inches. The insulation shall not be compressed to a thickness less than that specified. Insulation shall be carried over standing seams and trapeze-type duct hanger. Self-locking washers shall be installed where mechanical fasteners are used. The pin shall be trimmed back and bent over.
- v. Jacket overlaps shall be secured under the overlap with Class 2 adhesive and stapled on 4-inch centers. Staples and seams shall be coated with a brush coat of vapor barrier coating.
- vi. Breaks in the jacket material shall be covered with patches of the same material as the vapor barrier. The patches shall extend not less than 2 inches beyond the break or penetration in all directions and shall be secured with Class 2 adhesive and staples. Staples and joints shall be sealed with a brush coat of vapor barrier coating.
- vii. At jacket penetrations such as hangers and damper operating rods, voids in the insulation shall be filled and the penetration sealed with a brush coat of vapor barrier coating.
- viii. Insulation terminations and pin punctures shall be sealed and flashed with a reinforced vapor barrier coating finish. The coating shall overlap the adjoining insulation and uninsulated surface 2 inches. Pin puncture coatings shall extend 2 inches from the puncture in all directions.
- ix. Where insulation standoff brackets occur, insulation shall be extended under the bracket and the jacket terminated at the bracket.

## 9. Duct Test Holes

- i. After duct systems have been tested, adjusted, and balanced, breaks in the insulation and jacket shall be repaired in accordance with the applicable section of this specification for the type of duct insulation to be repaired.

## 3.2 STARTUP AND TRAINING

### A. OPERATING AND MAINTENANCE INSTRUCTIONS

1. All operating equipment installed under this section shall be placed in operation and shall function continuously in an operating test for a period of one week without shutdown due to mechanical failure or necessity of adjustment. Prior to

scheduling the Project Final Inspection and after completion of all installation and running adjustments, perform all work required to place the equipment in complete operating condition to meet all requirements under the Specifications.

2. During this running test period, deliver operating, service and replacement data for all equipment as per section 01730.

#### B. TRAINING

1. Conduct a training course for the maintenance and operating staff. The training period of 2 hours normal working time shall start after the system is functionally complete but before the final acceptance tests. The training shall include all of the items contained in the operating and maintenance instructions as well as demonstrations of routine maintenance operations. The Engineer shall be given at least 2 weeks advance notice of such training.
2. During all working hours of the one-week operating test, instruction personnel shall be available for and provide thorough and detailed training to the Owner's operating and maintenance personnel in operation, maintenance and adjustment of all equipment installed.
2. Give sufficient notice to the designated operating personnel of the owner in advance of this period. Upon completion of instruction, obtain from such representatives written verification on that which the above-mentioned instruction has been performed, such verification to be forwarded to the Engineer.

### 3.3 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout.
- B. Operation and Maintenance Manuals - Prepare manuals in accordance with Section 01730 - Operation and Maintenance Data.
- C. Record drawings shall be provided by the HVAC FSB as specified in Section 00700 - General Conditions of the Contract and Section 01170 - Special Provisions.
- D. Provide warranty and guarantee on all equipment furnished and work performed for a period of one (1) year from the date of substantial completion.

END OF SECTION 15500

SECTION 15900  
LABORATORY FUME HOODS  
(Part of Filed Sub-Bid Section 15002 – HEATING, VENTILATING AND AIR CONDITIONING –  
Filed Sub-Bid Required)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

1. 15500 – HEATING VENTILATING AND AIR CONDITIONING

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements
2. Division 1 – General Requirements

- C. Work included:

1. The Work of this section includes all labor, tools, material, fittings, accessories and equipment necessary to provide a complete and operable system in accordance with this section of these specifications, the drawings and the standards of the applicable codes listed therein.
2. The HVAC FSB shall be responsible for the following:
  - i. Fume Hood
  - ii. Fume Hood Controls including Hood Management System.
  - iii. Storage Cabinet PVC Vent into Fume Hood
  - iv. Coordination with Lab Hood exhaust ductwork and accessories included in specification section 15500.
  - v. Coordination with 12350 LABORATORY CASEWORK for support of Fume Hood.
  - vi. Coordination for wiring at Fume Hood for Blower, Lighting and controls.
  - vii. Manufacturer technicians for startup and training of the Lab Fume Hood Exhaust Fan, Hood Management System, and Exhaust Fan.
  - viii. The Work shall include the furnishing, set-up and maintenance of all hoisting machinery, staging, planking, ladders, etc. as required for the Work.
3. Secure all permits, inspection, and approvals and pay all costs and fees.

4. Unless the Specifications state "No Substitutions", substitutions will be considered for any specified item.
5. Coordinate safety program with that of the General Contractor. Cooperate with other trades to establish lines, levels, openings, chases, clearances, and locations to avoid interference, and to protect the Work.

D. Work not included:

1. SECTION 16120, WIRE AND CABLES - Power wiring and wiring for sensors and controllers; including hood control wiring for vfds, sensors, switches and controller.

### 1.3 SUBMITTALS

- A. Shop drawings, brochures and samples, as listed, shall be submitted for all items to be furnished in accordance with the provisions of SECTION 00700, GENERAL CONDITIONS and Section 01300 SUBMITTALS.
- B. Provide submittals for the following items consisting of manufacturer's published data. All submittals shall show compliance with the referenced specification.
  1. Fume Hood
  2. Fume Hood Controls

### 1.4 COORDINATION DRAWINGS

- A. The HVAC FSB shall prepare a complete set of AutoCad format floor plans and sections background drawings at a scale not less than 3/8" equals 1' 0", showing structure and other information as needed for coordination. These will be the Coordination Drawings.
- B. Each of the below specialty trades shall add its work to these background drawings in different colors and layers with appropriate elevations and grid dimensions. Specialty trade information is required for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.
  1. HVAC Systems and all sheet metal work.
  2. Plumbing Systems.
  3. Sprinkler System.
  4. Electrical System including light locations.
- C. Where conflicts occur with placement of materials of various trades, the HVAC FSB will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade.

- D. A Subcontractor who fails to promptly review and incorporate his work on the drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- E. The HVAC FSB shall make AutoCad electronic file of all coordination drawings. Fabrication shall not start until such transparencies of completed coordination drawings are received by the Architect/Engineer and have been reviewed.
- F. Review of coordination drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.
- G. The HVAC FSB shall provide the following distribution of documents:
  - 1. Electronic file of the Coordination Drawings to each specialty trade and affected Subcontractor for their use.
  - 2. Electronic file of the Coordination Drawings to the Engineer.
  - 3. Electronic file of the coordination drawings to General Contractor.
- H. Coordination Drawings include but are not necessarily limited to:
  - 1. Structure.
  - 2. Partition/room layout.
  - 3. Ceiling tile and grid.
  - 4. Light fixtures.
  - 5. Access panels.
  - 6. Sheet metal, grilles, diffusers, etc
  - 7. Domestic water, gas, soil, waste and vent piping and associated valves.
  - 8. Electrical conduit runs above 2” and electrical equipment.
  - 9. Sprinkler piping, heads and mounting brackets.

## 1.5 QUALITY ASSURANCE

- A. The equipment covered by the Specifications is intended to be standard equipment of proven quality as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practice of the industry and shall operate satisfactorily when installed in accordance with the Contract Documents. The Specifications call attention to certain details, but do not purport to cover all details entering into the construction of the equipment.
- B. All material shall be new and shall bear the manufacturer's full identification.
- D. Requirements of the Regulatory Agencies

1. The final, complete installation shall comply with all state and local statutory requirements having jurisdiction. Arrange for all necessary permits, pay all fees and arrange for all required inspections by local authorities. In general, all Work shall comply with the requirements of the rules, regulations, standards, codes, ordinances and laws of local, state and federal governments, and other authorities that have legal jurisdiction over the Project. Materials and equipment shall be manufactured, installed and tested as specified in latest editions of applicable publications, standards, rulings and determinations of:
  - i. Local and state building, plumbing, mechanical, electrical, fire and health department codes.
  - ii. ASHRAE Standard 110.1995 - Method of Testing Performance of Laboratory Fume Hoods
  - iii. National Fire Protection Association (NFPA).
  - iv. Occupational Safety and Health Act (OSHA).
  - v. Underwriter's Laboratories (UL).
  - vi. Material and equipment shall be listed by Underwriter's Laboratories (UL).
2. When requirements cited in the Specifications conflict with each other or with Contract Documents, most stringent shall govern Work.
3. Most recent editions of applicable specifications and publications of the following organizations form part of Contract Documents:
  - i. American National Standards Institute (ANSI).
  - ii. National Electric Manufacturers Association (NEMA).
  - iii. American Society for Testing and Materials (ASTM).
  - iv. Institute of Electrical and Electronics Engineers (IEEE).

#### 1.6 DELIVERY, STORAGE AND HANDLING

- A. All manufactured materials shall be delivered to the Project Site in original packages or containers bearing the manufacturer's labels and product identification. All materials and equipment shall be shipped, stored, handled and installed in such manner as not to degrade quality, serviceability, or appearance.
- B. Inspect all delivered equipment and materials, upon receipt at the Project Site, for damage and correctness.
- C. Store all materials and equipment on site in a location approved by the Engineer. Protect materials against dampness. Store off floors, under cover, and adequately protected from damage.
- D. Protect all Work, the Owner's property and the property of others from injury or loss caused by operations associated with the Work of this section. Make good any such injury or loss, at no cost to the party suffering the injury or loss.
- E. Deliver products to the Project Site and store and protect same as recommended by the manufacturer.

## 1.7 COORDINATION

- A. Check Contract Drawings as well as Shop Drawings of all trades to verify and coordinate spaces in which Work of this section will be installed.
- B. **The Fume Hood is supported by floor mounted Storage Cabinets. The dimensions of the Fume Hood and Storage Cabinets must be coordinated to allow space behind the Storage Cabinets for cabinet vents as well as allowing space for electrical wiring for the lighting and remote Hood Exhaust Fan switches and controls. The Architect and the Engineer shall review the Fume Hood submittal and the Storage Cabinet submittals together for proper coordination before either the Fume Hood or the Storage Cabinet submittals are accepted.**

## 1.8 DISCREPANCIES IN DOCUMENTS

- A. Where Contract Drawings or Specifications conflict or are unclear, advise the Engineer in writing before Award of Contract. Otherwise, the Engineer interpretation of Contract Documents shall be final, and no additional compensation shall be permitted due to discrepancies or incongruities thus resolved.
- B. Where Contract Drawings or Specifications do not coincide with manufacturers' recommendations, or with applicable codes and standards, alert the Engineer in writing before installation. Otherwise, make changes in installed Work as the Engineer requires at no additional cost to the Owner.
- C. If the required material, installation or Work can be interpreted differently from drawing to drawing, or between Contract Drawings and Specifications, the HVAC FSB shall provide that material, installation, or Work which is of the higher standard.
- D. Provide systems and components that are fully complete and operational and fully suitable for the intended use. There may be situations in the Contract Documents where insufficient information exists to precisely describe a certain component or subsystem, or the routing of a component. In cases such as this, where the HVAC FSB has failed to notify the Engineer of the situation in accordance with the Specifications, the HVAC FSB shall provide the specific component or subsystem with all parts necessary for the intended use, fully complete and operational, and installed in workmanlike manner either concealed or exposed per the design intent.
- E. In cases covered by the Contract Documents, where the HVAC FSB needs engineering guidance, submit a sketch identifying the proposed solution to the Engineer for approval.

## 1.9 MODIFICATIONS IN LAYOUT

- A. HVAC, Plumbing, Fire Protection and Electrical Drawings are diagrammatic. They indicate general arrangements of mechanical and electrical systems and other Work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet Architectural requirements.
- B. In all spaces, prior to installation of visible material and equipment, including access panels, review Drawings for exact locations and where not definitely indicated, request information from the Engineer.
- D. Maintain maximum headroom at all locations. All piping and associated components to be as tight to underside of structure as possible.
- E. Make reasonable modifications in layout and components needed to prevent conflict with Work of other trades and to coordinate as specified herein. Systems shall be run in a rectilinear fashion.

- F. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution to the Engineer for review and approval.

#### 1.10 WARRANTIES

- A. Submit manufacturer's standard replacement warranties for material and equipment furnished under this section. Such warranties shall be in addition to and not in lieu of all liabilities, which the manufacturer and the HVAC FSB may have by law or by provisions of the Contract Documents.
- B. All materials, equipment and Work furnished under this section shall be guaranteed against all defects in materials and workmanship for a minimum period of one year commencing with the Date of Substantial Completion. Any failure due to defective material, equipment or workmanship which may develop, shall be corrected at no expense to the Owner including all damage to areas, materials and other systems resulting from such failures.
- C. Guarantee that all elements of each system meet the specified performance requirements as set forth herein or as indicated on the Contract Drawings.
- D. Upon receipt of notice from the Owner of the failure of any part of the systems during the guarantee period, the affected parts shall be replaced. Any equipment requiring excessive service shall be considered defective and shall be replaced.

#### 1.11 PROTECTION OF WORK AND PROPERTY

- A. Care and protect all Work included under this section until it has been tested and accepted.
- B. Protect all equipment and materials from damage from all causes including theft. All materials and equipment damaged or stolen shall be repaired or replaced with equal material or equipment.
- C. Protect all equipment, outlets and openings with temporary plugs, caps and covers. Protect work and materials of other trades from damage that might be caused by Work or workmen under this section and make good damage thus caused.

#### 1.12 SPARE PARTS

- A. Furnish spare parts data for each different item of equipment furnished. The data shall include a complete list of parts and supplies, with current unit prices and source of supply; a list of parts and supplies that are either normally furnished at no extra cost with the purchase of the equipment, or specified hereinafter to be furnished as part of the contract; and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 180 days at the particular installation. The foregoing shall not relieve the HVAC FSB of any responsibilities under the guarantees specified herein.

#### 1.13 SUPPLEMENTARY STEEL, CHANNELS AND SUPPORTS

- A. Provide all supplementary steel, channels and supports required for the proper installation, mounting and support of all plumbing equipment, piping, etc., required by the Specifications.
- B. Supplementary steel and channels shall be firmly connected to building construction in a manner approved by the Engineer.
- C. The type and size of the supporting channels and supplementary steel shall be determined by the HVAC FSB and shall be of sufficient strength and size to allow only

a minimum deflection in conformance with the manufacturer's requirements for loading.

## PART 2 - PRODUCTS

### 2.1 GENERAL

#### A. FUME HOOD

1. Basis of Design is Kewaunee Scientific Corporation. Fume Hoods by CiF Lab Solutions, Diversified Casework, and Mott Manufacturing may be submitted for review as alternates. Acceptance of the alternates is contingent upon approval by the Engineer.
2. Specific Basis of Design Model is Kewaunee Model H05 Supreme Air Fume Hood with Restricted By-Pass.
3. Fume Hood shall be furnished pre-assembled and palletized.
4. Fume Hood dimensions are 48" wide by 36 " deep by 54" high. Hood is designed to fit atop 35 ¾" high cabinets for a total height of 89 ¾".
5. Superstructure frame shall be free standing steel angle to support exterior panels, interior liner and baffle panels. Exterior and interior panels shall be removeable without disassembly of the frame structure and outer steel panels to allow for maintenance. Side panels shall be removeable on both sides. Color: Glacier White.
6. Exterior superstructure shall be 18 gauge cold rolled steel, phosphate coated with a baked chemical resistant synthetic resin finish. Color: Glacier White. Provide 18 gauge cold rolled steel corner posts with access covers on the right and left sides.
7. Interior superstructure shall be galvanized steel.
8. Left/Right facia shall be powder coated steel.
9. Liner material shall be white modified epoxy resin sheet reinforced with glass fibers.
10. Work surface shall be black epoxy resin.
11. Provide integral airfoil at bottom of fume hood to provide airflow through coil when sash is closed.
12. Furnish hood with single point adjustable baffles that are operable by a selector knob near the front of the hood. Baffle material shall be molded Fiberglas Reinforced Polyester Resin.
13. Duct collar shall be 12" diameter stainless steel mounted on top of the cabinet.

14. Sash shall be vertical travel 28" high opening with tempered safety glass and counterweighted, balanced pulley system.
15. HOOD SHALL NOT BE FURNISHED WITH PLUMBING FIXTURES.
16. Furnish hood with factory wired T-5 single tube fluorescent light fixture with bulb. Light switch shall be mounted on front panel. Provide junction box for connection.
17. Furnish hood with two factory wired 120VAC 20 amp duplex GFCI receptacles. Receptacles shall be mounted on the front; one on each side. Provide junction box for connection.
18. Furnish hood with factory wired lab hood exhaust fan manual switch mounted on front panel. Voltage and amperage shall match the scheduled electrical characteristics on bid drawing H-10. Provide junction box for connection.
19. Furnish hood configured, arranged and ready to receive a field furnished and field mounted Hood Management System.
20. HVAC contractor shall furnish and field install a Hood Management System equal to Johnson Controls/Triatek Hood Management System HMS-1655-1-S. System shall include a Sash Position Sensor, Sidewall Face Velocity Sensor; and Controller with display pad, display alarms, and microprocessor controls to receive the sensor inputs and send a signal to the Fume Hood Exhaust Fan VFD. The microprocessor analog inputs and outputs shall be universal type suitable for 0 to 10 VDC and 4 to 20 mA signals. **Hood Management System Controller and Sensors shall be furnished and installed in the field by the HVAC FSB. Controller and Sensors shall be field wired by Electrical FSB.**

## 2.2 COORDINATION WITH CASEWORK

### A. STORAGE CABINET VENT

1. For Storage Cabinets containing acids, furnish and install 1-1/2" PVC vent. Vent shall commence inside the Storage Cabinet, run out the back of the cabinet, and connect to a 90-degree ell. A 1-1/2" vent stack pipe shall rise into the back of the Fume Hood behind the back panel and terminate with an open end about 7 inches above the Fume Hood working surface.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. The Fume Hood and Storage Cabinets which support the Fume Hood shall be coordinated as described in section 1.6 COORDINATION.
- B. The responsibility for determining the exact size and location of openings is part of the Work of this section. If this responsibility is not met, cutting and patching to achieve the correct size and location of openings and chases is part of the Work of this section.
- C. Do all cutting and patching required for the Work of the section, except cutting and patching of finish (visible) materials. Cutting and patching of masonry walls,

partitions, ceilings and floors is included. Concrete cutting shall be done with abrasive wheels or saws, and coring with a diamond core bit. The use of jackhammers is prohibited.

- D. Equipment shall be installed in strict accordance with manufacturer's instructions, unless otherwise specified herein, or on the Contract Drawings. In case of discrepancies, contact the Engineer for instructions.

### 3.2 CLEANING TESTING AND PAINTING

#### A. CLEANING

1. Clean all debris resulting from the work of the section, and remove it from the Project Site, daily.
2. Cover duct collar during installation. Tightly cover and protect fixtures and equipment against dirt, water and chemical or mechanical injury. At completion of all Work, thoroughly clean all fixtures, exposed materials and equipment.

#### B. TESTS

1. ASHRAE Standard 110-1995 Test:
  - i. Hood shall be tested with a face velocity of 100 FPM full open vertically and at 100 FPM right, left and center open horizontally.
  - ii. After test is complete, set sash stops at 1/3 open position for proper operation of MAU. Adjust as necessary.

#### C. PAINTING

1. Clean all surfaces free of dirt, oil, grease, etc. Surfaces shall be clean and dry before any paint is applied.
2. Restore to original condition and appearance any equipment which has sustained damage to the manufacturer's prime and/or finish coat.

### 3.3 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – CONTRACT CLOSEOUT.
- B. OPERATION AND MAINTENANCE MANUALS - Prepare manuals in accordance with Section 01730.
- C. Instruct Owner's operating personnel, during consecutive working days, in the operation and maintenance of the systems and equipment, to the written satisfaction of the Owner.
- D. Record drawings shall be provided by the HVAC FSB as specified in SECTION 00700, GENERAL CONDITIONS and SECTION 01170, SPECIAL PROVISIONS.

SECTION 16001

ELECTRICAL  
(Filed Sub-Bid Required)

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

- A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS all Sections within DIVISION 1 - GENERAL REQUIREMENTS, which are hereby made a part of this Section of the Specifications.
- B. Time, Manner and Requirements for Submitting Sub-Bids:
  - 1. Sub-Bids for work under this Section shall be for the complete work and shall be filed electronically on ProjectDog as stipulated in the Invitation to Bid.

The following shall be included in the electronic file name of the Sub-Bid:

NAME OF SUB-BIDDER: (Insert name of sub-bidder)

PROJECT: (Insert project name and number)

SUB-BID FOR SECTION: 16001 – ELECTRICAL

- 2. Each Sub-Bid submitted for work under this Section shall be on forms furnished as required by Section 44F of Chapter 149 or the Massachusetts General Law, as amended.
- 3. Sub-Bidders shall submit a BID BOND or CASH or CERTIFIED CHECK or a TREASURER'S or CASHIER'S CHECK issued by a responsible bank or trust company payable to the Awarding Authority in the amount of five percent (5%) of the Bid. Bid Securities shall be submitted in accordance with the Instructions to Bidders.
- C. Sub-Sub-Bid Requirements: None required under this Section.
- D. Reference Drawings: Work of this Filed Sub-Bid is shown in part or in full on the following Contract Drawings: G-1, G-2, C-6, C-7, A-5, A-6, E-1, E-2, E-3, E-4, E-5, E-6, E-7, E-8, E-9, E-10, E-11, E-12, E-13, E-14, E-15, E-16, E-17, E-18, E-19, E-20, E-21, E-22, E-23, E-24, E-25, E-26, E-27, E-28, E-29, E-30, E-31, E-32, I-1, I-4, and I-5.
- E. Work Included: Provide labor, materials and equipment to complete the work this Section, including but not limited to the following:

1. All work of: Section 16001 – Electrical, Section 16050 – Electrical General Conditions, Section 16060 – Grounding Systems, Section 16080 – Underground Systems, Section 16085 – Miscellaneous Equipment, Section 16120 – Wire and Cables, Section 16130 – Raceways and Fittings, Section 16442 – Panelboards, Section 16443 – Motor Control Centers, Section 16495 – Variable Frequency Drives, Section 16500 – Lighting System, Section 16601 – Lightning Protection System, Section 16612 – Engine Generator, Section 16720 – Security Alarm System, Section 16721 – Fire Alarm System, Section 16722 – Manual Alarm System, and Section 16740 – Communications System
- F. Related Sections: The Sub-Bidder is directed to the following Specification Sections for determination and description of the full character and extent of the work to be included in this filed sub-bid:
1. Division 1 – General Requirements
  2. Division 11 – Equipment
  3. Division 13 – Special Construction
  4. Division 15 – Mechanical
- G. Alternates: Not Applicable.

END OF SECTION 16001

## SECTION 16050

### ELECTRICAL GENERAL CONDITIONS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the following:

1. Section 16060 – Grounding Systems
2. Section 16080 – Underground Systems
3. Section 16085 – Miscellaneous Equipment
4. Section 16120 – Wire And Cables
5. Section 16130 – Raceways And Fittings
6. Section 16442 – Panelboards
7. Section 16443 – Motor Control Centers
8. Section 16495 – Variable Frequency Drives
9. Section 16500 – Lighting System
10. Section 16601 – Lightning Protection Systems
11. Section 16612 – Engine Generator System
12. Section 16650 – Photovoltaic Power System
13. Section 16720 – Security Alarm System
14. Section 16721 – Fire Alarm System
15. Section 16722 – Manual Alarm System
16. Section 16740 – Communications System

- B. Related Sections include the following:

1. Division 0 – Bidding and Contract Requirements

## 2. Division 1 – General Requirements

### C. Work included:

1. All labor, materials, tools, equipment, and accessory items and performing all operations necessary to furnish and install the complete electrical work in accordance with this section of these specifications, the Drawings and the standards of the applicable codes listed herein.
2. Furnishing and installation of equipment and items listed below and installation only of items furnished under other sections of these specifications.
  - i. Complete electrical service as hereinafter specified.
  - ii. Conduit, wire and electrical connections are required on certain items specified in sections of these specifications other than the electrical section. The Electrical FSB shall examine all sections of these specifications to determine the complete scope of the electrical work.
  - iii. Raceways and fittings
  - iv. Wires and cables
  - v. Miscellaneous equipment
  - vi. Panelboards
  - vii. Motor control centers
  - viii. Variable frequency drives
  - ix. Grounding systems
  - x. Underground systems
  - xi. Lighting systems
  - xii. Lightning Protection Systems
  - xiii. Communications system
  - xiv. Engine generator system
  - xv. Automatic transfer switch
  - xvi. Photovoltaic Power System
  - xvii. Security alarm system
  - xviii. Fire alarm system
  - xix. Manual alarm system
  - xx. Electrical demolition
3. Make all field connections to process instrument panels and other control panels furnished under other Divisions of these Specifications.
4. Mount and wire process instruments and equipment furnished under other Divisions of these Specifications. Furnish and install all conduit, wire and interconnections between process instrumentation primary elements, transmitters, local indicators and receivers. Mount and wire all lightning and surge protection equipment at process instrumentation transmitters and receivers.
5. Mount and make field connections to “packaged” equipment furnished under other Divisions of these Specifications.

6. Provide conduit and power/control wiring for all Process Mechanical, Instrumentation/Controls, HVAC (Heating, Ventilation and Air Conditioning), Plumbing, and Fire Protection equipment furnished under other Divisions of these Specifications.
7. Install and wire all thermostats, controllers and other devices furnished under other Divisions of these specifications which directly control HVAC equipment.
8. Review all submittals for equipment, devices, instrumentation, control panels, and ect. furnished under other Divisions to determine the point to point termination points for all wiring.

D. Work not included:

1. Excavation and backfilling, including gravel, common backfill or sand bedding for underground electrical work is included under Division 2 - Site Work of these Specifications.
2. Concrete work, including concrete electrical duct encasement, mounting pads, and housekeeping pads, is included under Division 3 - Concrete of these Specifications.

### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of the Section 00700 - General Conditions.
- B. Submittals required under this section include, but are not limited to the following:
  1. Panelboards
  2. Motor control centers
  3. Variable frequency drives
  4. Lighting fixtures
  5. Disconnect switches
  6. Control stations
  7. Security alarm system
  8. Fire alarm system
  9. Manual alarm system
  10. Miscellaneous equipment
  11. Generators

12. Automatic Transfer Switches
  13. Lightning Protection Systems
  14. Photovoltaic Power System
  15. Electric Vehicle Chargers
  16. Transformers
  17. Terminal cabinets
  18. Wire
  19. Conduit
  20. Receptacles
  21. Boxes and fittings
  22. Grounding Systems
  23. Underground Systems
- C. Submit all other data as specified herein.
- D. “As-built” copies of all shop Drawings shall be submitted to the Engineer before final inspection and acceptance.
- E. The responsibility for all dimensions to be confirmed and correlated at the job site and for coordination of this work with the work of all other trades is also included under the work of this Section 16050 - Electrical General Conditions.
- F. No material shall be ordered or shop work started until the Engineer's approval of shop Drawings has been given.
- G. Prior to submitting shop Drawings for lighting fixtures, verify the type of ceiling suspension systems being installed. Notify Engineer of any discrepancies between fixture type specified and suspension system. Additional cost rising from failure to notify the Engineer will be the responsibility of the Electrical FSB.

#### 1.4 QUALITY ASSURANCE

- A. Requirements of the Regulatory Agencies
1. The final, complete installation shall comply with all state and local statutory requirements having jurisdiction. The Electrical FSB shall arrange for all necessary permits, pay all fees and arrange for all required inspections by local authorities. In general, all work shall comply with the requirements of the National

Electrical Code, all state codes and the codes and ordinances of the city or town in which the work is to be done.

B. Materials and equipment used shall be Underwriters Laboratories, Inc. listed wherever standards have been established by that agency. Written approval by the Engineer and local inspecting authority is required wherever UL Listed approval is not available.

C. Manufacturer of Principal Equipment

1. All lighting and power panelboards shall be made by one manufacturer.
2. All motor controls furnished under this Section shall be made by one manufacturer.
3. All conduit of a given type shall be made by one manufacturer.
4. All wire and cables of a given type shall be made by one manufacturer.

D. Tests and Settings

1. Test all systems furnished under Division 16 - Electrical and repair or replace all defective work. Make all necessary adjustments to the systems and instruct the Owner's personnel in the proper operation of the system.
2. Make all circuit breaker and motor circuit protector settings.
3. The following minimum tests and checks shall be made prior to the energizing of electrical equipment. A certified test report shall be submitted stating that the equipment meets and operates in accordance with manufacturer's and job specifications, and that equipment and installation conforms to all applicable standards and specifications.
  - i. Testing of protective relays, static devices, circuit breakers and motor circuit protectors for calibration and proper operation and settings.
  - ii. Over potential, high potential, insulation resistance and shield continuity tests for cables.
  - iii. Mechanical inspection of air interrupter switches and circuit breakers.
4. Provide labor and electrical test equipment to assist the General Contractor, HVAC, Fire Protection and Plumbing contractors with systems testing and commissioning.
5. The Engineer shall be immediately notified of any unfavorable test results or indication of faulty equipment. No piece of equipment shall be energized until the test data is evaluated and the equipment is proven acceptable.
6. If the test and inspection data submitted should indicate deficiencies in the operation of the electrical apparatus or in the manufacturer thereof, the Electrical FSB shall promptly implement the necessary adjustments, corrections, modifications and/or replacements necessary to be made to meet the specified requirements.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.
- B. Electrical equipment shall at all times during construction be adequately protected against mechanical injury or damage by water. Electrical equipment shall not be stored out-of-doors. Electrical equipment shall be stored in dry permanent shelters. If stored for more than two weeks, the equipment shall receive all maintenance considerations required by the manufacturer for the proper storage of equipment. Proper storage in this context shall include the provision of heaters and dehumidifiers to keep the equipment dry at all times. If any apparatus has been damaged, such damage shall be repaired at no additional cost to the Owner. If any apparatus has been subject to possible injury by water, it shall be thoroughly dried out and put through such special tests as directed by the Engineer, or shall be replaced at no additional cost to the Owner.

## 1.6 COORDINATION

- A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow speedy and efficient completion of the work.
- B. Furnish to other trades advance information on locations and sizes of all frames, boxes, sleeves and openings needed for their work, and also furnish information and shop Drawings necessary to permit trades affected by the work to install same properly and without delay.
- C. In all spaces, prior to installation of visible material and equipment, including access panels, review all Contract Drawings for exact locations and where not definitely indicated, request information. Where the electrical work shall interfere with the work of other trades, assist in working out the space conditions to make satisfactory adjustments before installation. Without extra cost to the Owners, make reasonable modifications to the work as required by normal structural interferences. Maintain maximum headroom at all locations. All conduit, and associated components to be as tight to underside of structure as possible.
- D. If any electrical work has been installed before coordination with other trades so as to cause interference with the work of such trades, all necessary adjustments and corrections shall be made by the electrical trades involved without extra cost to the owners.
- E. Where conflicts or potential conflicts exist and engineering guidance is desired, submit sketch of proposed resolution for review and approval.
- F. Protect all materials and work of other trades from damage which may be caused by the electrical work, and repair all damages without extra cost to the owner.

## 1.7 SLEEVES AND FORMS FOR OPENINGS

- A. Provide and place all sleeves for conduits penetrating floors, walls, partitions etc. Locate all necessary slots for electrical work and form before concrete is poured.

## 1.8 CUTTING AND PATCHING

- A. All openings required by the work of these Sections shall be planned for in advance and coordinated with the Masonry FSB when penetration masonry walls. Any cutting and patching required by the lack of such planning shall be done by the General Contractor at the expense of this Electrical FSB. It will be the responsibility of this Electrical FSB to keep the General Contractor informed of all required openings.

## 1.9 SIZE OF EQUIPMENT

- A. Investigate each space in the structure through which equipment must pass to reach its final location. If necessary, the manufacturer shall be required to ship his material in sections sized to permit passing through such restricted areas in the structure.
- B. The equipment shall be kept upright at all times. When equipment has to be tilted for ease of passage through restricted areas during transportation, the manufacturer shall be required to brace the equipment suitably to ensure that the tilting does not impair the functional integrity of the equipment.

## 1.10 SUPPLEMENTARY SUPPORTING STEEL

- A. Provide all supplementary steelwork required for mounting or supporting equipment and materials.
- B. Steelwork shall be firmly connected to building construction as required.
- C. Steelwork shall be of sufficient strength to allow only minimum deflection in conformity with manufacturer's published requirements.
- D. All supplementary steelwork shall be installed in a neat and workmanlike manner parallel to floor, wall and ceiling construction; all turns shall be made at forty-five and ninety degrees, and/or as dictated by construction and installation conditions.
- E. All manufactured steel parts and fittings shall be galvanized steel for NEMA 1 and NEMA 12 Areas and stainless steel for NEMA 4 and NEMA 4X areas.

## 1.11 DESIGN CRITERIA

- A. Service Characteristics
  - 1. Primary Utility Voltage: 13.8KV
  - 2. Secondary Building Voltage - High Level: 480/277 V
  - 3. Secondary Building Voltage - Low Level: 120/208V
  - 4. All equipment and wiring shall be suitable for the applied voltage.
- B. Service and Metering

1. The power company serving this project is Eversource
2. A new service will be obtained at 480/277Volts, 3-phase, 4-wire from an existing utility pole and new pad mounted transformer provided by the utility company.
3. Furnish and install the primary service conduit.
4. General Contractor to furnish and install the pre-cast transformer mounting pad and oil containment curb.
5. Furnish and install the secondary service conduit, wire and connectors
6. Eversource will provide the meter. The Electrical FSB shall provide the meter socket and install all the metering equipment in accordance to the utility company requirements.
7. All Work and material for the electrical service shall be in accordance with the requirements of Eversource.
8. Make all arrangements and file work orders with Eversource for obtaining the water treatment plant's new service and furnish all labor and material for the services.
9. Make all arrangements and file work orders with Eversource for replacing Well #2 Station's existing service and furnish all labor and material for the services.
10. Make all arrangements and file work orders with Eversource for replacing Well #3 Station's existing service and furnish all labor and material for the services.
11. Make all arrangements and file work orders with Eversource for removing Well #4 Station's existing service and furnish all labor and material for the services.
12. Submit all Eversource invoice(s) associated with their services to the General Contractor. The Generator Contractor shall make all payments to Eversource as part of the Owner's Contingency Allowance as indicated in Section 00301 – Bid Form and Section 01024 – Measurement and Payment.

C. NEMA Ratings for Electrical Enclosures and Installations

1. NEMA Type 1 for building's Control Room, Electrical Room, Storage Room, Toilet Room, and Corridor.
2. NEMA Type 12 for building's Mechanical Room.
3. NEMA Type 4 for building's FE/MN Removal Room, PFAS Removal Room, Nitrate Removal Room, and existing pump stations interior.
4. NEMA Type 4X for building exterior, KOH & NaOCL Room, NaHSO<sub>3</sub> Room, and within holding tanks.

5. NEMA Type 7 for within the Tight Tank.

#### 1.12 INTERPRETATION OF DRAWINGS

- A. Electrical Drawings are diagrammatic. They indicate general arrangements of mechanical and electrical systems and other work. They do not show all offsets required for coordination nor do they show the exact routings and locations needed to coordinate with structure and other trades and to meet Architectural requirements.
- B. The Drawings are not intended to show exact routing of conduit runs or terminations. Electrical FSB shall determine exact location of conduit terminations by examinations of approved shop Drawings. The Electrical FSB shall not reduce the size or number of conduit runs indicated on the Drawings.
- C. Locate pull boxes, panelboards, control pushbuttons, terminal cabinets, safety switches and such other apparatus as may require periodic maintenance, operation, or inspection, so that they are easily accessible. If such items are shown on the Drawings in locations which are found to be inaccessible, advise the Engineer of the situation before work is advanced to the point where extra costs will be involved.
- D. Each three-phase circuit shall be run in a separate conduit unless otherwise shown on the Drawings.
- E. Unless otherwise approved by the Engineer conduits shown exposed shall be installed exposed; conduits shown concealed shall be installed concealed.
- F. Where circuits are shown as “home-runs” all necessary fittings and boxes shall be provided for a complete raceway installation.
- G. In general, wiring and raceway systems for lighting, receptacles, and security alarm systems are not indicated on the Drawings but shall be furnished and installed under this section.
- H. Each branch circuit shall have its own neutral, dedicated to that circuit. A common neutral for more than one single phase circuit is not allowed.
- I. Any work installed contrary to Drawings shall be subject to change as directed by the Engineer, and no extra compensation will be allowed for making these changes.
- J. The locations of equipment, fixtures, outlets, and similar devices shown on the Drawings are approximate only. Exact locations shall be determined by actual construction conditions, major deviations from locations shall be approved by the engineer. Obtain in the field all information relevant to the placing of electrical work and in case of any interference with other work, proceed as directed by the Engineer and furnish all labor and materials necessary to complete the work in an approved manner.
- K. Circuits on three phase panelboards shall be field connected to result in evenly balanced loads on each phase.

- L. Surface mounted panel boxes, junction boxes, conduit, etc., shall be supported by spacers to provide a clearance between wall and equipment.
- M. Circuit layouts are not intended to show the number of fittings, or other installation details. Furnish all labor and materials necessary to install and place in satisfactory operation all power, lighting, and other electrical system shown. Additional circuits shall be wherever needed to conform to the specific requirements of the equipment.
- N. All connections to equipment shall be made as required, and in accordance with the approved shop and setting Drawings.
- O. Schematic diagrams shown on the Drawings indicate the required functions only. Standard circuits of the particular manufacturer may be used to accomplish the functions indicated without exact adherence to the schematic Drawings shown. Additional wiring or conduit required for such deviations shall be furnished at the Electrical FSB expense. The Electrical FSB must ensure that all components necessary to accomplish the required function are provided.

#### 1.13 TEMPORARY POWER AND LIGHTING

- A. Furnish and install feeders of sufficient size from the utility company for the electric light and power requirements for the project while under construction and until the permanent feeders and related equipment have been installed and are in operation. Temporary lighting shall be based on a minimum of one watt per square foot covering each and every square foot in the building. Sufficient wiring, lamps, and outlets shall be installed to insure proper lighting in all rooms, space, and stairwells. Minimum sized lamp used shall be 1500 lumens. Where higher lighting intensities are required by Federal or State Standards of Laws or otherwise specified, the above specified lumens shall be increased to provide these increased intensities.
- B. All necessary transformers, meters, cables, panelboards, switches, temporary lamp replacements and accessories required for the temporary light and power installation shall be provided by the Electrical FSB.
- C. Provide and maintain in each area of the building and the building exterior, a feeder or feeders of sufficient capacity for the requirements of the entire floor and he shall provide a sufficient number of outlets, located at convenient points, so that extension cords of not over 50 ft. in length will reach all work requiring temporary light or power.
- D. Install and maintain the wiring and accessories for the portable trailer office of the General Contractor and Engineer.
- E. All temporary electrical work shall meet the requirements of the National Electrical Code Article 305 Temporary Wiring, the Local Utility Company, and all Federal Standards and Laws
- F. All temporary wiring and accessories thereto installed shall be removed after their purposes have been served.

- G. The General Contractor will pay for the cost of electric energy consumed by himself and by all of his Subcontractors, unless otherwise indicated.
- H. Provide all temporary lighting and power required above during the normal working hours of the project or a total of ten (10) hours per normal working day; Saturdays, Sundays and legal holidays are excluded. The ten hours per day shall include manning the temporary power and lighting 2 hour before and 2 hour after a normal eight (8) hour working day. In addition to the above, provide and maintain, to the satisfaction of the local authorities having jurisdiction, all temporary lighting and power that may be required for safety purposes. The Electrical FSB will be compensated by the General Contractor for any additional standby time, materials or equipment required by the General Contractor or other Subcontractors beyond the normal working hours, as defined above.

#### 1.14 COORIDINATION DRAWINGS

- A. The HVAC FSB shall prepare a complete set of AutoCAD format floor plans and sections” background Drawings at scale not less than 3/8" equals 1'-0", showing structure and other information as needed for coordination. These will be the Coordination Drawings.
- B. Each of the below specialty trades shall add its work to these background Drawings in different colors and layers with appropriate elevations and grid dimensions. Specialty trade information is required for fan rooms and mechanical rooms, horizontal exits from duct shafts, crossovers, and for spaces in and above ceilings where congestion of work may occur such as corridors, and even entire floors. Drawings shall indicate horizontal and vertical dimensions, to avoid interference with structural framing, ceilings, partitions, and other services.
  - 1. HVAC Systems and all sheet metal work.
  - 2. Plumbing Systems.
  - 3. Sprinkler System.
  - 4. Electrical System including light locations.
- C. Where conflicts occur with placement of materials of various trades, the HVAC FSB will be responsible to coordinate the available space to accommodate all trades. Any resulting adjustments shall be initialed and dated by the specialty trade.
- D. A Subcontractor who fails to promptly review and incorporate his work on the Drawings shall assume full responsibility of any installation conflicts affecting his work and of any schedule ramifications.
- E. The HVAC FSB shall make an AutoCAD electronic file of all coordination Drawings. Fabrication shall not start until such transparencies of completed coordination Drawings are received by the Architect/Engineer and have been reviewed.

- F. Review of coordination Drawings shall not diminish responsibility under this Contract for final coordination of installation and maintenance clearances of all systems and equipment with Architectural, Structural, Mechanical, Electrical and other work.
- G. The HVAC FSB shall provide the following distribution of documents:
  - 1. Electronic file of the Coordination Drawings to each specialty trade and affected Subcontractor for their use.
  - 2. Electronic file of the Coordination Drawings to the Engineer.
  - 3. Electronic file of the Coordination Drawings to General Contractor.
- H. Coordination Drawings include but are not necessarily limited to:
  - 1. Structure.
  - 2. Partition/room layout.
  - 3. Ceiling tile and grid.
  - 4. Light fixtures.
  - 5. Access panels.
  - 6. Sheet metal, grilles, diffusers, etc.
  - 7. Domestic water, gas, soil, waste and vent piping and associated valves.
  - 8. Electrical conduit runs above 2” and electrical equipment.
  - 9. Sprinkler piping, heads and mounting brackets.

## PART 2 –PRODUCTS - NOT APPLICABLE

## PART 3 – EXECUTION

### 3.1 WORK IN EXISTING STRUCTURES

- A. Each bidder or his authorized representatives shall, before preparing his proposal, visit all areas of the existing structures in which work under this bid is to be performed and inspect carefully the present installation. The submission of the proposal by this bidder shall be considered evidence that he or his representative has visited the buildings and structures and noted the locations and conditions under which the work will be performed and that he takes full responsibility for a complete knowledge of all factors governing his work.

- B. In general, any or all existing electrical equipment and services are to remain in operation and shall not be disturbed unless otherwise noted in these Specifications and/or on the Drawings or as required for the proper execution of the work.
- C. In each area of the work, disconnect and carefully remove the existing electrical equipment and devices so noted. With the exception of items indicated as having to be re-used, all such existing equipment and device shall be turned over to the Owner. If not required by the Owner, remove them from the premises and site. All existing electrical equipment and devices indicated as not removed or abandoned are to be maintained in operation and any circuits disturbed by the construction shall be restored.
- D. Maintain existing electrical services and systems to and in the buildings throughout the project and all “down-time” shall be scheduled at least two weeks in advance with the permission of the Engineer and such scheduling shall be rigidly adhered to.

### 3.2 CORING

- A. Provide all coring for conduits penetrating floors, walls, partitions etc.
- B. Provide waterproof sealing for the penetrations through exterior walls, etc.
- C. Foam type water proofing is not allowed.

### 3.3 MANUFACTURER'S SERVICES

- A. Provide manufacturer's services for testing, training and start-up of the following equipment:
  - 1. Generator System
  - 2. Automatic Transfer Switch
  - 3. Variable Frequency Drives
  - 4. Photovoltaic System
  - 5. Security Alarm System
  - 6. Fire Alarm System
  - 7. Manual Alarm System
  - 8. Electric Vehicle Charger
- B. The time required for each system shall be as hereinafter specified. The time specified shall be used as directed by the Engineer and shall not be used by the manufacturer or Electrical FSB for field adjustments due to manufacturing or shipping defects.

### 3.4 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Operation and Maintenance Manuals - Prepare manuals in accordance with Section 01730.
- C. Record Drawings shall be provided by the Electrical FSB as specified in Section 00700 – General Conditions of the Contract and Section 01700 – Contract Closeout.
- D. Provide warranty and guarantee on all equipment furnished and work performed for a period of one (1) year from the date of substantial completion.

END OF SECTION 16050

## SECTION 16060

### GROUNDING SYSTEMS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work covered under this Section of the Specifications includes the furnishing and installing of a complete grounding system in strict accordance with Article 250 of the National Electrical Code and as specified herein and as shown on the Drawings.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Wire
  - 2. Ground rods
  - 3. Ground bus bars

##### 1.4 QUALITY ASSURANCE

- A. Testing
  - 1. The grounding system shall be tested under this section.
  - 2. The equipment grounding shall be checked to insure continuity of the ground return path.
  - 3. The ground grid systems shall be tested using the three terminal fall in potential method. A minimum of eight test points for each ground grid system shall be submitted for review by the Engineer. The test points shall be made along a straight line from the grid system to the reference terminal. The distance between the grid system and the reference terminal shall be consistent with normal practices for ground testing.
  - 4. All test equipment shall be furnished hereunder and shall be similar to Biddle Earth Tester No. 250220 or equal.

5. These tests shall be performed during the dry season. Tests shall be performed before loaming and seeding or paving work has been performed.
6. The Electrical FSB shall notify the Engineer immediately if the ground grid system exceeds 5 ohms.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## PART 2 – PRODUCTS

### 2.1 WIRE

- A. Wire shall be as specified under Section 16120 – Wire and Cables.

### 2.2 GROUND RODS

- A. Ground rods shall be copper clad steel 3/4 inch in diameter and 10 feet in length unless otherwise shown on the Drawings. Rods shall be either one 10 foot length or two shorter lengths coupled together by a thermic welding process. Ground rods shall be Copperweld, equal by A.B. Chance Co., or equal.

### 2.3 GROUNDING BUS BARS

- A. Grounding bus bars shall be copper, not less than ¼ inch by 2 inch by 24 inch.
- B. All lugs, bolts and nuts shall be silicon bronze.
- C. Bus bars to be securely mounted to room wall with brackets and insulators.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Grounding electrode conductors shall be run in rigid conduits. Protecting conduits shall be bonded to the grounding electrode conductors at both ends.
- B. Grounding conductors shall be run with feeders where shown on the Drawings or hereinafter specified.
- C. Liquid tight flexible metal conduit in sizes 1 inch and larger shall have bonding jumpers. Bonding jumpers shall be external, run parallel (not spiraled) and fastened with plastic tie wraps. Tie wraps shall be installed 12 inches apart and not more than 6 inches from ends.
- D. Connect the following equipment by separate wire or cable directly to the grounding grid system.

1. Service entrance meter
  2. Frame of each transformer
  3. Neutral of each transformer
  4. Service entrance circuit breaker
  5. Ground buses
  6. Metal Fencing
  7. Propane Tanks
  8. Generator Enclosure
- E. Connect the following equipment by separate wire or cable to the equipment's ground bus and or ground terminal:
1. Panelboards
  2. Control panels
  3. Equipment having feeders and branch circuit installed in non-metallic raceways.
  4. Motors
  5. Receptacle circuits
- F. The following equipment shall be grounded separate wire or cable to the equipment's ground chassis or ground terminal:
1. All metal cases and support frames
  2. Lighting system
  3. 120 Volt motors
- G. Bond the following N.E.C. approved electrodes together to form a ground grid system:
1. Metallic water piping
  2. Building steel frame
  3. Steel reinforcing rods
  4. Grounding rods and plates
  5. Buried bare copper conductors

- H. Grounding electrodes shall be driven where shown on the Drawings. Spacing between electrodes shall be equal to or greater than the length of the electrodes.
- I. Exposed grounding connections shall be made by means of approved bronze clamps. Exposed connections between different metals shall be sealed with No. Oxide Paint Grade A, or equal.
- J. All grounding connections shall be made by means of approved bronze clamps. Exposed connections between different metals shall be sealed with No-Oxide Paint Grade A, or equal.
- K. All buried connections shall be made by a thermic welding process equal to Cadweld. Molds used for the welding process shall be new having no prior usage. Molds shall be the specific type for the connection to be made.
- L. All buried conductors shall be laid slack in trenches. The earth surrounding the cables shall be void of sharp objects which may injure the cables. Backfill material shall be natural earth. Where cables are exposed to mechanical injury they shall be protected by pipes or other substantial guards. If guards are iron pipe or other magnetic material, conductors shall be electrically connected to both ends of the guard. Connections shall be made as hereinbefore specified.
- M. Do not allow water piping to be painted. If the connections are painted, they shall be disassembled and remade with new fittings.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16060

## SECTION 16080

### UNDERGROUND SYSTEMS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes furnishing and installing of a complete underground system of raceways, handholes, and frames and covers as specified herein and as shown on the Drawings.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Raceways
  - 2. Handholes, frames, and covers
  - 3. Warning Tape

##### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

#### PART 2 – PRODUCTS

##### 2.1 RACEWAYS

- A. Raceways shall be PVC schedule 40 conduit. Raceway materials shall be in accordance with Section 16130 – Raceways and Fittings.

##### 2.2 CONCRETE HANDHOLES, FRAMES AND COVERS

- A. Electric Hand holes shall be either precast or cast in place steel reinforced concrete per details in contract Drawings, concrete to have minimum strength of 5000 psi after 28 days.

- B. Hand holes frame and covers shall be steel and meet or exceed the Tier 20 load requirements set forth in the American National Standards Institute's ANSI/SCTE 77. The frame shall be securely bolted to handhole with stainless steel bolts and the cover be embedded with the following logs:
  - 1. "ELECTRICAL" logo for electrical power applications.
  - 2. "COMMUNICATIONS" logo telecommunication applications.
  - 3. "CONTROL" logo low voltage applications.
- C. General Contractor to furnish and install all concrete Handholes and their associated frames and covers.

### 2.3 HANDHOLES

- A. Non-Utility Hand holes shall be UL listed, made of Polymer Concrete with Polymer Concrete Cover and open bottom.
- B. The polymer concrete shall be molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.
- C. Impact resistant tested per ASTM D-2444.
- D. Hand hole enclosure and covers shall meet or exceed the Tier 22 load requirements set forth in the American National Standards Institute's ANSI/SCTE 77 2010
- E. Hand holes shall be a minimum 11"x18".
- F. Covers shall be securely bolted to enclosure with stainless steel bolts and be on type and be embedded with the following logs:
  - 1. "ELECTRICAL" logo for electrical power applications
  - 2. "COMMUNICATIONS" logo telecommunication applications.
  - 3. "CONTROL" logo low voltage applications.
- G. Provide 12 inches of compacted crushed stone under all hand holes

### 2.4 POLYETHYLENE WARNING TAPE

- A. Warning tape shall be red polyethylene film, 6 inch minimum width, Type XB-720 by W.H. Brady Co., or equal.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Raceways shall be installed to drain away from buildings. Raceways between handholes shall drain toward the handholes. Raceway slopes shall not be less than 3 inches per one hundred feet.
- B. Raceway banks shall be encased in concrete. Concrete shall be reinforced with steel rods.
- C. Plastic spacers shall be used to hold raceways in place. Spacers shall provide not less than two inch clearance between raceways.
- D. The minimum cover for raceway banks shall be 30 inches unless otherwise permitted by the Engineer.
- E. Raceway entrances to buildings and structures shall be made with steel conduit not less than ten feet long.
- F. Conduits in duct banks entering buildings and structures shall be spread to allow adequate room for conduit wall seals, pull and terminal boxes.
- G. Where bends in raceways are required, long radius elbows, sweeps and offsets shall be used. Sweeps at riser pole shall be rigid steel encased in concrete.
- H. All raceways shall be swabbed clean before cable installation.
- I. Spare raceways shall be plugged and sealed watertight at all buildings and structures.
- J. Raceways in use shall be sealed watertight at all buildings and structures.
- K. Rigid steel conduit shall be used for risers at the service pole and other locations shown on the Drawings. Conduit sweep at pole base shall be rigid steel conduit.
- L. Raceway terminations at manholes shall be with end bells.
- M. Pulling-in irons shall be installed opposite all raceway entrances to manholes.
- N. All underground metallic conduit run underground in direct contact with earth shall be coated with asphaltum or bitumastic varnish or similar corrosion protection the entire length of the run.
- O. All underground raceways/ductbanks shall be marked with warning tape located approximately 12 inches below grade above the raceway/ductbank.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16080

## SECTION 16085

### MISCELLANEOUS EQUIPMENT

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes the furnishing and installing of all miscellaneous equipment as specified herein and as shown on the Drawings.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.

- B. Submittals required under this section include, but are not limited to the following:

1. Automatic Transfer Switches
2. Manual Transfer Switches
3. Generator Docking Stations
4. Enclosed Circuit Breakers
5. Surge Protection Device (SPD)
6. Disconnect switches
7. Motor Starters
8. Dry type transformers
9. Electric vehicle charging stations
10. Enclosure types
11. Control Stations
12. Break Glass Stations
13. Wireway

14. Terminal cabinets and Junction Boxes

15. Relays

16. Nameplates

17. Floor Mats

18. Warning Signs

19. Meter Socket

#### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

### PART 2 –PRODUCTS

#### 2.1 AUTOMATIC TRANSFER SWITCH

- A. The automatic transfer switch shall be true 3-pole, solid neutral, delayed transition type, microprocessor based control designed for an emergency and normal source of 480 Volts, 3 Phase, 4 Wire, 60 Hertz. Current ratings shall be as indicated on the Drawings.
- B. Each switch shall be mounted in a NEMA 12 enclosure.
- C. The complete switch assembly including accessories shall be listed under UL-1008 for use on emergency systems.
- D. The complete transfer switch assembly shall be factory tested to ensure proper operation and compliance with the specification requirements. A copy of the factory test report shall be available upon request.
- E. System Operation
  - 1. When the voltage on any phase of the normal source drops below 80% or increases to 120%, or frequency drops below 90%, or increase to 110%, or 20% voltage differential between phases occurs, after a programmable time delay period of 0-9999 seconds factory set at 3 seconds to allow for momentary dips, the engine starting contacts shall close to start the generating plant.
  - 2. The transfer switch shall transfer to emergency when the emergency source has reached specified voltage and frequency on all phases.
  - 3. After restoration of normal power on all phases to a preset value of at least 90% to 110% of rated voltage, and at least 95% to 105% of rated frequency, and voltage differential is below 20%, an adjustable time delay period of 0-9999 seconds (factory set at 300 seconds) shall delay retransfer to allow stabilization of normal

power. If the emergency power source should fail during this time delay period, the switch shall automatically return to the normal source.

4. After retransfer to normal, the engine generator shall be allowed to operate at no load for a programmable period of 0-9999 seconds, factory set at 300 seconds.

#### F. Construction

1. The transfer switch shall be double throw, actuated by two electric operators momentarily energized, and connected to the transfer mechanism by a simple over center type linkage. Minimum transfer time shall be 400 milliseconds.
2. The normal and emergency contacts shall be positively interlocked mechanically and electrically to prevent simultaneous closing. Main contacts shall be mechanically locked in both the normal and emergency positions without the use of hooks, latches, magnets, or springs, and shall be silver-tungsten alloy. Separate arcing contacts with magnetic blowouts shall be provided on all transfer switches. Interlocked, molded case circuit breakers or contactors are not acceptable.
3. The transfer switch shall be equipped with a safe manual operator, designed to prevent injury to operating personnel. The manual operator shall provide the same contact to contact transfer speed as the electrical operator to prevent a flashover from switching the main contacts slowly.
4. Transfer switch shall be adequately constructed to carry its full rated current on a continuous 24 hour basis in all approved enclosures and shall not show excessive heating or be subject to de-rating.
5. The minimum withstand and close-in current rating in symmetrical amperes shall be equal to or greater than the interrupting rating of the normal power source circuit breaker. In no case shall this rating be less than 20 times the transfer switch full load current rating. The switch contacts shall not weld or be damaged in any way as a result of a fault of up to the withstand and close-in rating.
6. The main contacts shall be visible for inspection without any major disassembly of the transfer switch.
7. A fully rated solid neutral bus bar with required AL-CU neutral lugs shall be provided.
8. Control components and wiring shall be front accessible. All control wires shall be multiconductor 18 gauge 600-volt SIS switchboard type point to point harness. All control wire terminations shall be identified with tubular sleeve-type markers.
9. The switch shall be equipped with 90 degrees C rated copper/aluminum solderless mechanical type lugs.

#### G. Controls

1. The transfer switch shall be equipped with a microprocessor based control system, to provide all the operational functions of the automatic transfer switch. The controller shall have two asynchronous serial ports. The controller shall have a real time clock with NiCad battery back up.
2. The CPU shall be equipped with self diagnostics which perform periodic checks of the memory I/O and communication circuits, with a watchdog/power fail circuit
3. A door mounted controller with a 20 character, LCD display, with a keypad, which allows access to the system shall be provided. The controller shall have password protection required to limit access to qualified and authorized personnel.
4. The controller shall include three-phase over/under voltage, over/under frequency, phase sequence detection and phase differential monitoring on both normal and emergency sources.
5. The controller shall be capable of storing the following records in memory for access either locally or remotely:
  - i. Number of hours transfer switch is in the emergency position (total since record reset).
  - ii. Number of hours emergency power is available (total since record reset).
  - iii. Total transfer in either direction (total since record reset).
  - iv. Date, time, and description of the last four source failures.
  - v. Date of the last exercise period.
  - vi. Date of record reset.
6. Reference the I-Drawings for additional requirements.

#### H. Accessories

1. Programmable three phase sensing of the normal source set to pickup at 90% and dropout at 80% of rated voltage and overvoltage to pickup at 120% and dropout out at 110% of rated voltage. Programmable frequency pickup at 95% and dropout at 90% and over frequency to pickup at 110% and dropout at 105% of rated frequency. Programmable voltage differential between phases, set at 20%, and phase sequence monitoring.
2. Programmable three phase sensing of the emergency source set to pickup at 90% and dropout at 80% of rated voltage and overvoltage to pickup at 120% and dropout out at 110% of rated voltage programmable frequency pickup at 95% and dropout at 90% and over frequency to pickup at 110% and dropout at 105% of rated frequency. Programmable voltage differential between phases set at 20%, and phase sequence monitoring.
3. Time delay for override of momentary normal source power outages (delays engine start signal and transfer switch operation). Programmable 0-9999 seconds. Factory set at 3 seconds, if not otherwise specified.

4. Time delay to control contact transition time on transfer to either source. Programmable 0-9999 seconds, factory set at 3 seconds.
5. Time delay on retransfer to normal, programmable 0-9999 seconds, factory set at 300 seconds if not otherwise specified, with overrun to provide programmable 0-9999 second time delay, factory set at 300 seconds, unloaded engine operation after retransfer to normal.
6. Time delay on transfer to emergency, programmable 0-9999 seconds, factory set at 3 seconds.
7. A maintained type load test switch shall be included to simulate a normal power failure, keypad initiated.
8. A remote type load test switch shall be included to simulate a normal power failure, remote switch initiated.
9. A time delay bypass on retransfer to normal shall be included. Keypad initiated.
10. Dry contact, rated 10 Amps 120 volts AC, to close on failure of normal source to initiate engine starting.
11. Dry contact, rated 10 Amps 120 volts AC, to open on failure of normal source for customer functions.
12. Light emitting diodes shall be mounted on the microprocessor panel to indicate: switch is in normal position, switch is in emergency position and controller is running.
13. An exerciser shall be provided with (10) 7-day events, programmable for any day of the week and (24) calendar events, programmable for any month/day, to automatically exercise generating plant programmable in one-minute increments. Also include selection of either "no load" (switch will not transfer) or "load" (switch will transfer) exercise period. Keypad initiated.
14. Provision to select either "no commit" or "commit" to transfer operation in the event of a normal power failure shall be included. In the "no commit position," the load will transfer to the emergency position unless normal power returns before the emergency source has reached 90% of its rated values (switch will remain in normal). In the "commit position" the load will transfer to the emergency position after any normal power failure. Keypad initiated.
15. Two auxiliary contacts rated 10 Amp, 120 volts AC, shall be mounted on the main shaft, one closed on normal, the other closed on emergency. Both contacts will be wired to a terminal strip.
16. A three phase digital LCD voltage readout, with 1% accuracy shall display all three separate phase to phase voltages simultaneously, for both the normal and emergency source.

17. A digital LCD frequency readout with 1% accuracy shall display frequency for both normal and emergency source.
18. An LCD readout shall display normal source and emergency source availability.
19. Include (2) time delay contacts that open simultaneously just (milliseconds) prior to transfer in either direction. These contacts close after a time delay upon transfer. Programmable 0-9999 seconds after transfer.

## 2.2 MANUAL TRANSFER SWITCHES

- A. The manual transfer switch shall be UL listed, designed for transfer between normal source and alternate source of 277/480 Volts, 3 Phase, 4 Wire, 60 Hertz. Current ratings shall be as indicated on the drawings.
- B. The transfer switch shall be service entrance rated of double throw contact construction with a 3-position emergency-off-normal external handle.
- C. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.

## 2.3 GENERATOR DOCKING STATIONS

- A. Docking stations shall include 16 Series Camlok Panel Mounts for use as connection to portable generator.
- B. Entire package must be listed to ETL or UL 1008 Standards. UL listing of individual components is not acceptable.
- C. Enclosures:
  1. NEMA 3R rain-tight, aluminum enclosure
  2. Pad-lockable front door shall include a hinged access plate at the bottom for entry of cables from portable generator or portable load bank. NEMA 3R integrity shall be maintained with access plate open for cable entry.
  3. Front and side through a front access panel shall be accessible for maintenance.
  4. Top, side, and bottom through a front access panel shall be accessible for permanent cabling.
- D. Phase, Neutral, and Ground Buses:
  1. Material: Silver-plated Copper
  2. Equipment Ground Bus: bonded to box.
  3. Isolated Ground Bus: insulated from box.

4. Ground Bus: 50% of phase size.
  5. Neutral Bus: Neutral bus rated 100 percent of phase bus.
- E. Generator connectors shall be male Camlok style mounted on gland plate, color coded according to system voltage.
1. A phase – Brown
  2. B phase – Orange
  3. C phase – Yellow
  4. N Neutral – White or Gray
  5. G Ground – Green
- F. Temporary connectors shall include protective flip lids to prevent accidental contact.
- G. Permanent connectors shall be broad range set-screw type, located behind an aluminum barrier.
- H. Short Circuit & Withstand Rating: 65KAIC.
- I. Panel mounted Phase monitoring relay.
- J. Power Cables:
1. For each docking station provide colored power cables for each phase, ground, and neutral connection with pre-wired color coded male and female Camlok connectors at each cable end. Cable color coding to match Camlok color.
  2. Cable to be UL type W portable power cable with copper conductors insulated with synthetic rubber (EPDM). The cable is to be covered with a colored CPE rubber jacket applied in two layers with reinforcement placed between the layers.
  3. Cable and plug assembly to have full rated capacity of the Generator Docking Station, cables shall be 4/0 AWG rated for 405 Amps.
  4. All cables shall have a minimum length of 50 feet.

## 2.4 ENCLOSED CIRCUIT BREAKERS

- A. Circuit breakers shall be molded case, 3 pole unless otherwise noted, with voltage rating as required. Ampere rating shall be as shown on the Contract Drawings. Provide with service entrance rating where required.
- B. Main breaker shall be solid state with digital trip and adjustable trip setting with LED on face of breaker providing amps per phase. Provide auxiliary contacts for trip status to remote alarm.

- C. The interrupting capacity shall be not less than as indicated on the Drawings, RMS symmetrical.
- D. All circuit breakers with 225 Ampere frames and larger shall have interchangeable trips.
- E. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.

2.5 SURGE PROTECTION DEVICE (SPD)

A. Electrical Service SPD

- 1. Certify unit listed to UL 1449, 3rd Edition and UL 1283.
- 2. SPD shall be UL labeled as Type 1, intended for use without need for external or supplemental overcurrent devices. Every suppression component of every mode, including N-G, shall be protected by internal overcurrent and thermal over-temperature controls. SPDs relying upon external or supplementary installed safety disconnectors do not meet the intent of this specification.
- 3. SPD to be enclosed, surfaced mount and to include surge counter, audible alarm and dry contact for remote status.
- 4. Minimum surge current capability (single pulse rated) per phase shall be 200kA
- 5. Voltage Protection Ratings (VPRs) shall not exceed the following:

System Voltage	L-N	L-G	L-L	N-G
208Y/120	700V	700V	1000V	600V
480Y/277	1200V	1200V	2000V	1200V

- 6. Maximum Continuous Operating Voltage (MCOV) (verifiable at UL.com):

System Voltage	Allowable System Voltage Fluctuation (%)	MCOV
208Y/120	25%	150V
480Y/277	15%	320V

- 7. SPD shall be installed per manufacturer’s installation instructions with lead lengths as short (less than 24”) and straight as possible. Gently twist conductors together.

2.6 DISCONNECT SWITCHES (VISIBLE BLADE TYPE)

- A. Visible blade type disconnect switches shall be heavy-duty, quick-make, quick-break, visible blades, 600 Volt, 3 pole with full cover interlock.
- B. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.

- C. Provide service entrance rated disconnect switches for all feeders originating from an outdoor generator source.

## 2.7 DISCONNECT SWITCHES (TOGGLE TYPE)

- A. Toggle type disconnect switches shall be quick-make, quick-break with handle guard and lock-off feature.
- B. Switches shall be provided for resistance type loads only. Switches shall not be installed where full load current of utilization equipment exceeds 18 Amperes.
- C. Switches shall be rated 20 Amperes at 600 Volts and 30 Amperes at 250 Volts, 60 Hertz, 2 or 3 pole.
- D. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.

## 2.8 MANUAL MOTOR STARTERS

- A. Manual motor starters shall be provided for single-phase motors. Manual starters shall be non-reversing, reversing or two speed type as shown on the Drawings. Built-in control stations shall be provided where shown on the Drawings.
- B. Where indicated on Drawings manual motor starters shall have a local/remote or hand/off/auto selector switch.
- C. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.

## 2.9 DRY TYPE TRANSFORMERS

- A. Dry type transformers shall be dry type, copper, two-winding with KVA and voltage ratings as shown on the Drawings.
- B. Transformers shall be furnished with full capacity primary voltage taps as follows:
  - 1. 0.25 KVA to 2 KVA - None
  - 2. 3 KVA to 10 KVA - Two - 5 percent below normal.
  - 3. 11 KVA to 500 KVA - Two - 2-1/2 percent below normal and two 2-1/2 percent above normal.
- C. Transformers shall be designed for indoor or outdoor service as required for the locations shown on the Drawings.
- D. Transformers shall be designed in accordance with ANSI, IEEE and NEMA standards.

- E. Normal efficiency transformers shall be furnished in sized to 15 KVA. Maximum temperature rise of transformers as measured by resistance above a 40 degree C ambient shall not exceed:
  - 1. 115 degree C for transformers rated up to 25 KVA.
  - 2. 80 degree C for transformers rated up to 500 KVA.
- F. Energy efficient transformers shall be furnished in ratings 30 KVA and larger and certified to meet DOE 10 CFR Part 431:2016. Temperature rise of transformers above a 40 degree C ambient shall not exceed 80 degree C.
- G. All insulating materials shall be in accordance with NEMA standards for a 220 degree C UL component recognized insulation system.
- H. Transformers shall be manufactured by ABB, General Electric, Hammond Corp., or Schneider Electric.

## 2.10 ELECTRIC VEHICLE CHARGING STATIONS

- A. Provide UL listed, NEMA 3R, dual port, bollard mount charging stations at locations indicated on the drawings.
- B. Electrical Ratings:
  - 1. Electrical Input: 208V, 60Hz, 1-Phase, 30A for each port.
  - 2. Electrical Output: 7.2KW at each port
- C. Operating Conditions:
  - 1. Operating Temperature: -22 to 122 F
  - 2. Non-Operating Humidity: Up to 95% @ 122 F non-condensing
  - 3. Operating Humidity: Up to 85% @ 122 F non-condensing
  - 4. Terminal Block Temperature Rating: 221 F
- D. Safety Features:
  - 1. Compliance: UL 2594, UL 2231, NEC Article 625, FCC Part 15 Class A
  - 2. Surge Protection: 6kV @ 3000A
  - 3. Internal service panel protected GFCI, 20mA CCID with auto retry that continuously monitors ground connection.
  - 4. Surge Protection: 6kV @ 3000A

- E. Charging cords shall be maintenance free, light weight, self retracting, 18' length with SAE J1772 connector, overhead cable management system and have dedicated locking holsters on the station.
- F. Charger to have ISO 15693, ISO 14443, NFC card reader, LTE Category 4 integral modem, and 2.4 GHz WiFi (802.11 b/g/n) connectivity.
- G. Charger to have interface display indicating full user instructions and charger information.

## 2.11 ENCLOSURE TYPES

- A. NEMA Type 1 and Type 12 enclosures shall be general purpose sheet steel.
- B. NEMA Type 4 enclosures shall be stainless steel, PVC or fiberglass.
- C. NEMA Type 3R enclosures shall be galvanized steel or aluminum.
- D. Type 4X enclosures shall be stainless steel.

## 2.12 CONTROL STATIONS

- A. Control stations shall be heavy-duty type, with full size operators.
- B. All control stations located at motors and where shown on the Drawings shall have a padlock attachment for locking out the stop button or position.
- C. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.
- D. Control stations shall be equivalent to Class 9001 as manufactured by Square D Co.

## 2.13 BREAK GLASS STATION

- A. Break Glass stations shall be industrial duty pushbutton type with operator held in the depressed position by a glass disc mounted in a NEMA 4X wall mounted enclosure.
- B. The station shall have 2-SPST NO and 2-SPST NC contacts rated at 10 amps continues at 480V. The NC contacts shall be utilized for equipment shutoff, the NO contacts shall be designated for remote alarms.
- C. A break glass hammer shall be provided, mounted and permanently chained to the station.
- D. Provide clear identification of the break glass station and the equipment the station is controlling.

## 2.14 WIREWAY

- A. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.
- B. Wireway shall be equivalent to "Square Duct" as manufactured by Square D Co.

## 2.15 TERMINAL CABINETS AND JUNCTION BOXES

- A. Enclosures shall meet the area NEMA designation for which they are located, NEMA Type 1, 12, 3R, 4, and 4X enclosures shall be as specified herein.
- B. Provide terminal strips for all terminations.

## 2.16 RELAYS

- A. Control relays shall be heavy duty machine tool type, with 10 Ampere, 300 Volt convertible contacts. Time delay relays shall be true type, adjustable 0.2 to 180 seconds.
- B. Interposing relays shall be of the type designed to operate motor starters. Relays shall be panel mounted where associated with motors starter enclosures and variable frequency drives enclosures. Standalone relays can be NEMA 4X enclosed type with ½" NPT connection and wire leads for mounting to junction boxes.

## 2.17 NAMEPLATES

- A. Nameplates shall be provided for all special purpose tumbler switches, disconnect switches, remote control stations, motor starters, time clocks, panelboards, terminal cabinet, etc. to designate the equipment controlled and function.
- B. Nameplates shall be black and white laminated, phenolic material having engraved letters approximately 1/4 inch high, extending through the black face into the white layer.
- C. Nameplates shall be attached to the panel by self-tapping stainless steel screws or rivets.

## 2.18 FLOOR MATS

- A. Provide 1/4" x 36" corrugated all rubber insulating matting in front of new 480V power distribution equipment.
- B. Matting shall be proof tested to 20,000 volts and conform to ASTM D178-93.
- C. Matting to be manufactured by Biltrite or equal.

## 2.19 WARNING SIGNS

- A. Electric rooms shall be furnished with a warning sign. Sign shall read “DANGER HIGH VOLTAGE KEEP OUT!”. Signs shall be as manufactured by Thomas & Betts, Seton, or equal.

## 2.20 METER SOCKET

- A. Provide a utility meter socket in a NEMA 3R enclosure with HASP cover provision of the type approved by the utility company.
- B. Meter Socket shall be 13 Jaw with 10 pole FT switch terminal block form 9s transformer rated.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. All field mounted devices shall be mounted four feet-six inches above the finished floor or grade. Devices shall be adequately supported on walls, columns or other supports. Furnish and install channel iron imbedded in the ground or floor to support devices where necessary.
- B. Devices installed in areas with hung ceilings, in toilet and administrative areas, and in similar areas, shall be installed flush with finished surfaces.
- C. All control equipment shall be identified as to the equipment it controls.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16085

## SECTION 16120

### WIRE AND CABLES

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes the furnishing, installing and testing of all wire, cable and appurtenances as specified herein and as shown on the Drawings. All wiring of a given type shall be the product of one manufacturer.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Wire
  - 2. Cable
  - 3. Terminations
  - 4. Lugs
  - 5. Markers
  - 6. As-Built Wire Marking List

##### 1.4 QUALITY ASSURANCE

- A. Testing
  - 1. All 600 Volt wire insulation shall be tested with a megohm meter after installation. Tests shall be made at not less than 500 Volts. Submit a written test report of the results to the Engineer.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## 1.6 DESIGN CRITERIA

- A. Wire for single phase circuits shall be Type XHHW or THWN-THHN.
- B. Wire for three phase circuits shall be Type XHHW.
- C. Single conductor wire for control, indication and metering shall be Type THWN/THHN No. 12 or 14 AWG, stranded.
- D. Multi-conductor control cable shall be used for the underground system and shall be No. 12 or 14 AWG, stranded.
- E. Wire for process instrumentation shall be twisted shielded pairs No. 16 AWG, stranded.
- F. Ground wires shall be Type THW, green. Bare ground wires shall be soft drawn copper, 98 percent conductivity.
- G. Except for control and signal leads, no wire smaller than number 12 AWG shall be used.

## PART 2 –PRODUCTS

### 2.1 MATERIALS

- A. Wires and cables shall be of annealed, 98 percent conductivity, soft drawn copper.
- B. All conductors No. 12 AWG and larger sizes shall be stranded.

### 2.2 600 VOLT WIRE

- A. Type XHHW shall be cross-linked polyethylene, as manufactured by Pirelli Cable Corp., Collyer Insulated Wire Co., The Okonite Co. or equal.
- B. Type RHW shall be cross-linked polyethylene, as manufactured by Pirelli Cable Corp., Collyer Insulated Wire Co., The Okonite Co., or equal.
- C. Type THWN/THHN shall be as manufactured by Pirelli Cable Corp., Collyer Insulated Wire Co., The Okonite Co. or equal.
- D. Multi-conductor control cable shall be stranded, 600 Volt, cross-linked polyethylene insulated, neoprene jacketed, as manufactured by Rome Cable Corp., or equal.

### 2.3 VFD CABLE

- A. VFD cable shall be three conductor, stranded copper, PVC jacketed shielded type, tray cable (TC) rated 600 volts with three symmetrical ground conductors.
- B. Individual conductors shall be 600 Volt rated Type XHHW-2 as specified herein.

### 2.4 INSTRUMENTATION CABLE

- C. Process instrumentation wire shall be twisted pair, 600 Volts, polyethylene insulated, aluminum tape, tinned copper braid shielded, polyvinyl chloride jacketed, as manufactured by Okonite Co., Belden Corp., or equal.

### 2.5 METAL CLAD CABLE

- A. Metal Clad sheathed cable NFPA 70, type MC may be used above suspended ACT ceiling systems only. All branch circuits shall be run in conduit from the panelboard to the first outlet with the ceiling system.
- B. MC cable used shall contain a full-size insulated ground conductor. All conductors shall be copper TWHN.
- C. MC cable conductors' insulation shall have voltage rating of 600 volts, shall have a temperature rating of 75 degrees C. and shall be thermoplastic material.
- D. Armor material shall be steel and armor design shall be interlocked metal tape.
- E. Fire alarm rated MC cable may be used for fire alarm work above the suspended ACT ceiling system.

### 2.6 COAXIAL CABLE

- A. Coaxial cable shall be LMR-900 type, bare copper .222" ID tube, foam polyethylene dielectric, tinned copper braid shielded, aluminum tape outer conductor, polyethylene jacketed, as manufactured by Times Microwave Systems, Allied Wire & Cable, or equal.
- B. Provide all LMR-900 coaxial cable metallic connectors.
- C. Provide a PolyPhaser or equal lightning surge suppressor for connection to the antenna cable to each panel. The surge suppressor shall be mounted on a plywood backboard secured to the wall.
  - 1. Insertion loss: less than or equal to 0.1 dB over the frequency range
  - 2. Throughput energy: less than or equal to 600  $\mu$ J for a 50kA 8/20  $\mu$ s waveform.

## 2.7 CONNECTORS AND TERMINAL LUGS

- A. Splices for No. 10 or No. 12 A.W.G. solid wires, such as for lighting branch circuits, shall be made with insulated wire connectors.
- B. Connectors and terminal lugs on wires No. 8 A.W.G. and larger shall be of the mechanical or clamp type.

## 2.8 WIRE AND CABLE MARKERS

- A. Wire and cable markers shall be “Omni-Grip” as manufactured by W.H. Brady Co., or equal.
- B. Wire and cables with diameters exceeding the capacity of the “Omni-Grip” shall be marked with pre-printed, self-adhesive vinyl tapes as manufactured by W.H. Brady Co., T&B Fasteners Inc., or equal.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. All conductors shall be carefully handled to avoid kinks or damage to insulation.
- B. All wires, cables and each conductor of multi-conductor cables (except lighting and receptacle wiring) shall be uniquely identified at each end with wire and cable markers.
  - 1. Where wiring originates from a motor control center or process control panel the wire identification number shall incorporate the terminal numbers used in the control center or panel and a number to identify the motor control center or panel.
  - 2. Wires shall be identified at both ends and at intermediate junction boxes, terminal cabinets, etc. Wire identification numbers shall be unique.
  - 3. A typed list of the numbers used at each motor control center and control cabinet shall be submitted for approval.
- C. Multi-conductor cables shall be marked at all terminations.
- D. Lubrications shall be used to facilitate wire pulling. Lubricants shall be U.L. approved for use with the insulation specified.
- E. Shielded instrumentation wire shall be installed from terminal to terminal with no splicing at any intermediate point.
- F. Shielded instrumentation wire shall be installed in termination and pull boxes that contain only shielded instrumentation wire.
- G. Shielding on instrumentation wire shall be grounded at the transmitter end only.
- H. Each branch circuit shall have a dedicated neutral.

3.2 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16120

## SECTION 16130

### RACEWAYS AND FITTINGS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes the furnishing and installing of complete raceway systems as specified herein and as shown on the Drawings.
- B. All raceway systems shall be complete with fittings, boxes or cabinets, and necessary connections to result in a complete system.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Raceways.
  - 2. Boxes and Fittings.

##### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

##### 1.5 DESIGN CRITERIA

- A. Except where otherwise shown on the Drawings, or hereinafter specified, all interior raceways installed shall be exposed and be PVC Schedule 80. Metal clad cable is allowed above suspended ACT ceiling systems but shall not be located anywhere outside the suspended ceiling area.
- B. Except where otherwise shown on the Drawings, or hereinafter specified, all exposed exterior raceways installed shall be rigid galvanized conduit. PVC Coated Rigid galvanized steel conduit sweeps shall be used where concealed conduits rise up through concrete slabs and mounting pads.

- C. PVC Schedule 40 conduit shall be used underground and below floor slabs except as specified herein and where otherwise indicated on the Drawings.
- D. All conduit of a given type shall be the product of one manufacturer.
- E. Unless otherwise hereinafter specified or shown on the Drawings, all boxes shall be metal.
- F. PVC boxes and fittings shall be used with PVC conduit all other boxes shall be metal.
- G. Combination expansion-deflection fittings shall be used where conduits cross structure expansion joints. Refer to Structural Drawings for expansion joint locations.
- H. Conduit wall seals shall be used where underground conduits penetrate walls or at other locations shown on the Drawings.

## PART 2 –PRODUCTS

### 2.1 RIGID CONDUIT

- A. Rigid heavy wall steel conduit shall be hot-dipped galvanized as manufactured by the Youngstown Sheet and Tube Co., Allied Tube and Conduit Corp., Wheeling-Pittsburgh Steel Corp., or equal.
- B. PVC conduit where installed underground shall be rigid polyvinyl chloride Schedule 40 as manufactured by Carlon, Phillips Petroleum Co., Triangle Pipe & Tube Co., Inc., or equal.
- C. PVC conduit used in non-underground locations shall be rigid polyvinyl chloride Schedule 80 as manufactured by Carlon, Phillips Petroleum Co., Triangle Pipe & Tube Co., Inc., or equal.
- D. PVC coated rigid steel conduit shall have a 0.040 inch thick, polyvinyl chloride coating permanently bonded to hot-dipped galvanized steel conduit, as manufactured by Calbond, Ocal, Robroy Industries, or equal.

### 2.2 LIQUIDTIGHT, FLEXIBLE METAL CONDUIT, COUPLINGS AND FITTINGS

- A. Liquidtight, flexible metal conduit shall be Sealtite, Type UA, as manufactured by Anaconda American Brass Co., or equal by American Flexible Conduit Co., Inc., or equal.
- B. Fittings used with flexible conduit shall be of the screw-in type as manufactured by Thomas and Betts Co., Crouse-Hinds Co., O.Z. Manufacturing Co., or equal.

### 2.3 BOXES AND FITTINGS

- A. PVC boxes and fittings shall be as manufactured by Carlon, An Indian Head Co., O.Z. Manufacturing Co., or equal.

- B. Steel elbows and couplings shall be hot-dipped galvanized.
- C. Conduit hubs shall be as manufactured by Myers Electric Products, Inc., Raco Div., O.Z. Manufacturing Co., or equal.
- D. Conduit wall seals shall be Type WSK as manufactured by O.Z. Manufacturing, Co., or equal by Link Seal Co.
- E. Combination expansion-deflection fittings shall be Type XD as manufactured by Crouse-Hinds Co., or equal by Appleton Electric Co., O.Z. Manufacturing Co.
- F. Conduit seal bushings shall be Type CSB as manufactured by O.Z. Manufacturing Co., or equal by Crouse-Hinds Co.
- G. Explosion proof conduit seals shall be Type EYS as manufactured by O.Z. Manufacturing Co., or equal by Crouse-Hinds Co. and Appleton Electric Co.

#### 2.4 CONDUIT MOUNTING EQUIPMENT

- A. Hangers, rods, backplates, beam clamps, etc. shall be hot-dipped galvanized iron or steel. Mounting equipment shall be as manufactured by B-Line Co., Thomas and Betts Co., Unistrut Corp., or equal.

#### 2.5 CORROSION PROTECTION FOR GALVANIZED CONDUIT

- A. Corrosion protection for galvanized conduit shall be cold galvanized zinc based paint as manufactured by L.P.S. Co., Los Angeles, California, CRS Chemicals, Drecher, Pennsylvania, or equal.

### PART 3 – EXECUTION

#### 3.1 INSTALLATION

- A. No conduit smaller than 3/4 inch electrical trade size shall be used, nor shall any have more than three 90 degree bends in any one run. Approved factory elbows shall be used when sharper bends are necessary. Pull boxes shall be provided as required or directed.
- B. No wire shall be pulled until the conduit system is complete in all details; in the case of concealed work, until all rough plastering or masonry has been completed; in the case of exposed work, until the conduit system has been completed in every detail.
- C. The ends of all conduits shall be tightly plugged to exclude dust and moisture while the buildings are under construction.
- D. Conduit supports shall be spaced at intervals of eight feet or less, as required to obtain rigid construction.
- E. Single conduits shall be supported by means of one-hole pipe clamps in combination with one-screw back plates, to raise conduits from the surface. Multiple runs of

conduits shall be supported on trapeze type hangers with steel horizontal members and threaded hanger rods. The rods shall be not less than 3/8 inch diameter. Wire hangers will not be accepted.

- F. Conduit hangers shall be attached to structural steel by means of beam or channel clamps. Where attached to concrete surfaces, concrete inserts of the spot type shall be provided.
- G. All conduits on exposed work and concealed above hung ceilings shall be run at right angles to or parallel with surrounding wall and shall conform to the form of the ceiling. Diagonal runs will not be allowed. Bends in parallel conduit runs shall be concentric. All conduit shall be run perfectly straight and true.
- H. Conduit terminating in pressed steel boxes shall have double locknuts and insulated bushings.
- I. PVC conduits shall be installed using a fusing cement process. Conduits shall be water tight.
- J. Conduit terminating in gasketed enclosures shall be terminated with conduit hubs.
- K. Metallic heavy wall conduits shall be installed using threaded fittings. Threadless fittings may be used in isolated instances when approved by the Engineer.
- L. Liquidtight flexible metal conduit shall be used for all motor terminations and other equipment where vibration is present.
- M. When a conduit has to be cut in the field, it shall be cut square using a hand or power hacksaw cutter, or an approved pipe cutter using knives. The use of pipe cutter wheels will not be permitted. The cut ends of the field cut conduit shall be reamed to remove burrs and sharp edges. Where threads have to be cut on conduit, the threads shall have the same effective length and shall have the same thread dimensions and taper as specified for factory cut threads on conduits. Field cut threads shall be protected by a field applied cold galvanizing compound.
- N. Conduits entering buildings below grade shall be furnished with a conduit seal bushing.
- O. Where ducts terminate at panelboards, terminal cabinets, etc. panel of sufficient width and depth shall be provided to maintain the 2 inch spacing between ducts or wireways shall be provided below panels, cabinets, etc.
- P. A ground wire shall be run in all runs of PVC conduit.
- Q. All bends in PVC conduit shall be made using a hotbox and bending guide tool.
- R. Conduits run underground below the highest known ground water level shall not enter buildings below this groundwater level without first being run through a drain manhole, handhole, or exterior pull box.

3.2 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16130

## SECTION 16442

### PANELBOARDS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes the furnishing and installing of all panelboards as specified herein and as shown on the Drawings. All panelboards shall be provided with the applicable NEMA enclosure in accordance with the Electrical Specification, NEMA 1 enclosures shall be utilized for areas designated as NEMA 12.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Panelboards, including construction details and enclosures.
  - 2. Terminals and lugs
  - 3. Trim
  - 4. Buses
  - 5. Circuit Breakers
  - 6. Groundfault Circuit Interrupter
  - 7. Metering

##### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

##### 1.5 DESIGN CRITERIA

- A. Panelboard ratings shall be as shown on the Drawings. All panelboards shall be rated for the intended voltage.

- B. Panelboards shall be in accordance with the Underwriter Laboratories, Inc. “Standard for Panelboards” and “Standard for Cabinets and Boxes” and shall be so labeled where procedures exist. Panelboards shall also comply with NEMA Standard for Panelboards and the National Electrical Code.
- C. Panelboards used for service entrance shall be Underwriter Laboratories labeled “Suitable for use as service equipment”.

## PART 2 –PRODUCTS

### 2.1 PANELBOARD CONSTRUCTION

#### A. Interiors

1. All interiors shall be completely factory assembled with circuit breakers, wire connectors, and buses. All wire connectors, except screw terminals, shall be of the anti-turn solderless type and all shall be suitable for copper wire of the sizes indicated.
2. Interiors shall be designed such that circuit breakers can be replaced without disturbing adjacent units and without removing the main bus connectors and shall be such that circuits may be changed without machining, drilling or tapping.
3. Branch circuits shall be arranged using double row construction except when narrow column panels are indicated. Branch circuits shall be numbered by the manufacturer.
4. A factory provided label shall be provided listing panel type, number of circuit breakers and ratings.

#### B. Buses

1. Main bus shall be copper. Full size neutral bars shall be included. Phase bussing shall be full height without reduction. Cross connectors shall be copper. All buses shall be tinned.
2. Main bus shall be distribution phase sequence type configuration to allow installation of two or three pole circuit breakers at any location.
3. Neutral bussing shall have a suitable lug for each outgoing feeder requiring a neutral connection.
4. Spaces for future circuit breakers shall be bussed for the maximum device that can be fitted into them.
5. Solderless main lugs or main circuit breakers shall be furnished as shown on the Drawings.
6. Bus bracing to be at least equal to the interrupting rating of lowest rated circuit breaker installed in panel. Series rated breakers and panels shall not be acceptable.

### C. Boxes

1. Recessed boxes shall be made from galvanized code gauge steel having multiple knockouts unless otherwise noted. Surface mounted boxes shall be painted to match the trim. Boxes shall be of sufficient size to provide a minimum gutter space of four inches on all sides.
2. Surface mounted boxes shall have an internal and external finish as specified herein. Surface mounted boxes shall be field punched for conduit entrances.
3. At least four interior mounting studs shall be provided.

### D. Trim

1. Hinged door-indoor construction shall enclose all circuit breaker handles and shall be included in all panel trims.
2. Doors shall have semi flush type cylinder lock and catch, except that doors over 48 inch in height shall have a vault handle and three point catch, complete with lock, arranged to fasten door at top, bottom and center. Door hinges shall be concealed. Two keys shall be supplied for each lock. All locks shall be keyed alike. A directory frame and card having a transparent cover shall be furnished on each door.
3. Trims shall be fabricated from code gauge sheet steel.
4. Trims for flush panels shall overlap the box by at least 3/4 inch all around. Surface trims shall have the same width and height as the box. Trims shall be fastened with quarter turn clamps.

### E. Manufacturer

1. 120/208 Volt and 277/480 Volt three phase distribution panelboards rated for 1200 Amps and less shall be Pow-R-Line 4X type as manufactured by Eaton, or equal by Square D and General Electric. Equipment layouts are based on the dimensions on the Eaton Power R-Line 4X distribution panelboards.
2. 120/240 Volt, single phase, 3 wire, and 120/208 Volt three phase, 4 wire branch circuit panelboards rated for 225 Amps and less shall be Pow-R-Line 1X single tub type as manufactured by Eaton, or equal by Square D and General Electric.

## 2.2 CIRCUIT BREAKERS

- A. Panelboards shall be equipped with circuit breakers with frame size and trip settings as shown on the Drawings. Circuit breaker mounting shall not exceed 78 inches above floor.
- B. Circuit breakers shall be molded case, bolt-in type.

- C. Circuit breakers shall have an interrupting capacity of not less than the RMS symmetrical panelboard rating as indicated on the Drawings.
- D. Main circuit breaker shall be attached to the main vertical bus.
- E. Main breaker shall have solid state digital trip unit with adjustable long, short, and instantaneous trip settings.

### 2.3 GROUND FAULT CIRCUIT INTERRUPTER (GFCI)

- A. GFCI shall be provided for circuits where indicated on the Drawings. GFCI units shall be molded case, bolt-on breakers, incorporating a solid state ground fault interrupter circuit insulated and isolated from the breaker mechanism. The unit shall be U.L. listed Class A Group I device (30 milliamp sensitivity, 25 millisecond trip time), and an interrupting capacity matching the circuit breakers in the panelboards.

### 2.4 DIGITAL POWER MULTIMETER

- A. Main Distribution panelboard shall be metered with a digital power multimeter.
- B. Digital Power Meter
  - 1. Digital power meter shall be true RMS type power monitor with features to data log (30 days) and communicate remotely the AC amperes on each phase, voltage, harmonic distortion, watts, volt amperes, bars, power factor, frequency, demand watts, demand volt ampere and watt hours; and capable of providing alarm status for phase loss, phase on balance, phase reversal and provides all data to remote monitoring systems.
  - 2. The power meter shall communicate using Modbus RTU via a RS-485 port and Ethernet protocol via a RJ-45 port and be able connect to any host devices.
- C. Provide small control wiring, necessary fuse blocks, suitable numbering strips and terminal blocks as required
- D. Provide current transformers for each meter. Current transformers shall be wired to shorting type terminal blocks. All transformers used for metering shall meet the requirements of IEEE C12.11 and IEEE C57.13.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Boxes for surface mounted panelboards shall be mounted so there is at least 1/2 inch air space between the box and the wall.
- B. Circuit directories shall be typed identifying location and nature of load served.
- C. Panelboards installed in areas with finished walls shall be installed recessed into the wall with the front of the panel flush with the finished wall

3.2 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16442

## SECTION 16443

### MOTOR CONTROL CENTERS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes furnishing all labor, materials, tools and equipment necessary to furnish and install Motor Control Centers as shown on Drawings, specified herein, or evidently required to complete the work.
- B. Refer to various DIVISION 11 sections and E-Drawings control wiring diagrams for field device interface.
- C. Refer to I-Drawings for additional requirements.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Complete wiring diagrams, and elementary or control schematics of each compartment, including coordination with other electrical control devices operating in conjunction with the motor control center and suitable outline Drawings shall be submitted for approval before proceeding with manufacture. Due to the complexity of the control functions, it is imperative the above Drawings be clear, full-size and carefully prepared to facilitate interconnections with other equipment. Standard preprinted sheets or Drawings simply marked to indicate applicability to this Contract will not be acceptable.
  - 2. Bill-of-material listing conductor material and insulation type as well as other hardware and equipment to be furnished.
  - 3. Catalog cut sheets and other necessary information on each device (relay, timer, circuit, breaker etc.) furnished and installed in or on the motor control center, to describe operating characteristics completely.
  - 4. Where it is not explicitly shown and completely obvious from the outline Drawings the following items shall be verified in a written statement accompanying the submittal.

- i. Type of terminal blocks used that the removal of plug-in compartments can be performed without disconnecting or removing wires
  - ii. Plating of bus
  - iii. Insulation and isolation of vertical bus
  - iv. Underwriter's Laboratories (UL) approval.
5. Clear and concise information for storage, installation, operation, and care of the equipment. Non-applicable portions of standard publications shall be so marked.
  6. Time current curves of each size and type of each overcurrent protective device.

#### 1.4 QUALITY ASSURANCE

- A. The motor control centers and protection devices in this specification shall be designed and manufactured according to latest revision of the following standards (unless otherwise noted).
  1. ANSI/IEEE/NFPA 70 - National Electrical Code.
  2. Federal Specification W-C-375, Rev. B, Amend. 1, Circuit Breakers, Molded Case; Branch Circuit and Service.
  3. NEMA AB 1, Molded Case Circuit Breakers and Molded Case Switches.
  4. NEMA AB 3, Molded Case Circuit Breakers and Their Application.
  5. NEMA AB 4, Guidelines for Inspection and Preventive Maintenance of Molded Case Circuit Breakers Used in Commercial and Industrial Applications.
  6. ANSI C84.1, Voltages Tolerances for North America.
  7. NEMA Publication 250, Enclosures for Electrical Equipment.
  8. UL 508, UL Standard for Safety Industrial Control Equipment.
  9. UL 845, UL Standard for Motor Control Centers.
  10. UL 50, UL Standard for Safety Enclosures for Electrical Equipment.
  11. ANSI/NEMA ICS 6, Enclosures for Industrial Controls and Systems.
  12. NEMA 250, Enclosures for Electrical Equipment.
  13. NEMA ICS 2, General Standards for Industrial Control Systems.
  14. NEMA ICS 3, Standards for Industrial Control Devices, Controllers and Assemblies.
  15. NEMA ST 20, Dry Type Transformers for General Applications.

16. UL 508, Industrial Control Equipment.

B. The entire MCC shall go through a quality inspection before shipment. This inspection will include:

1. Physical Inspection of Structure.

- i. Bussing.
- ii. General wiring.

2. Electrical Tests AC Dielectric Tests of:

- i. Power circuits
- ii. Control circuits.

3. Electrical Tests before shipment shall include:

- i. Power circuit phasing.
- ii. Control circuit wiring.
- iii. Instrument transformers.
- iv. Meters.
- v. Ground fault system.
- vi. Device electrical operation.

4. Markings/Labels, include:

- i. Instructional type.
- ii. Underwriters Laboratory (UL)/Canadian Standards Association (CSA).
- iii. Inspector's stamps.

5. The manufacturer shall use integral quality control checks throughout the manufacturing process to ensure that the MCC meets operating specifications.

C. Tests and Checks

1. Prior to energizing megger terminals and buses for grounds after disconnecting devices sensitive to megger voltage.

## 1.5 DELIVERY, STORAGE, AND HANDLING

A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance

B. Separate Motor Control Center into shipping splits of up to 3 vertical sections. Each shipping split shall include a removable lifting angle, or lifting tabs, for positioning equipment at job site.

C. Store, protection, and handle motor control centers in accordance with recommended practices listed in manufacturer's Installation and Maintenance Manuals.

- D. Delivery each motor control center split on individual shipping skids wrapped for protection.
- E. Inspect and report concealed damage to carrier within specified time.
- F. Store MCCs in a clean, dry space. Maintain factory protection or cover with heavy canvas or plastic to keep out dirt, water, construction debris, and traffic. Provide heat to prevent condensation.

## 1.6 DESIGN CRITERIA

- A. All motor control centers shall be furnished by a single motor control center manufacturer. Equipment modified by intermediate equipment assemblers will not be acceptable.
- B. All units and sections shall be U.L. labeled. Motor control centers designed for service entrance application shall be U.L. labeled "Suitable for Use as Service Equipment."
- C. Make all necessary field measurements to verify that equipment shall fit in allocate space in full compliance with minimum required clearances specified in National Electrical Code.
- D. Motor control centers as shown on the Drawings are sized based upon the specified manufacturers. If the motor control centers actually furnished deviate from the sizes shown on the Drawings, these deviations shall be clearly delineated as exceptions to the specifications, and will be subject to approval by the Engineer.
- E. MCC shall be inspected before shipment including structure, electrical conductors, bussing, general wiring, and devices.

## PART 2 –PRODUCTS

### 2.1 MANUFACTURERS

- A. Eaton
- B. General Electric Company
- C. Square D Corp.

### 2.2 MATERIALS

- A. Each MCC shall consist of one or more vertical sections of heavy gauge steel bolted together to form a rigid, free-standing assembly.
- B. Steel material shall comply with UL 845 and CSA requirements.
- C. A removable 7 gauge structural steel lifting angle shall be mounted full width of the MCC lineup at the top. Removable 7 gauge bottom channel sills shall be mounted underneath front and rear of the vertical sections extending the full width of the lineup.

- D. Vertical sections made of welded side-frame assembly formed from a minimum of 12 gauge steel. Internal reinforcement structural parts shall be of 12 and 14 gauge steel to provide a strong, rigid assembly.
- E. The entire assembly shall be constructed and packaged to withstand normal stresses included in transit and during installation.

## 2.3 STRUCTURES

- A. Structures shall be totally enclosed, dead-front, free-standing assemblies. Motor control centers shall be designed for against-the-wall mounting. All wiring, bus joints and other mechanical parts requiring tightening or other maintenance shall be accessible from the front or top.
- B. Structures shall be capable of being bolted together to form a single assembly.
- C. The overall height of the MCC shall not exceed 90 in (2286 mm) (not including base channel or lifting angle).
- D. Base channels, of 1.5 in (38 mm) in height, and lifting angles, of 3 in (76 mm) in height, shall be removable.
- E. The total width of one section shall be 20 in or 21 in, minimum. Widths of 25 in (630 mm), 30 in (760 mm), and 35 in (890 mm) shall be used for large devices.
- F. Structures NEMA Type shall meet the NEMA designations for where they are located.
- G. Each standard wide section shall have all the necessary hardware and bussing for modular plug-in units to be added and moved around. All unused space shall be covered by hinged blank doors and equipped to accept future units. Vertical bus openings shall be covered with manual bus shutters.
- H. Each section shall include a top plate and bottom plate. Top and bottom plates shall be removable for ease in cutting conduit entry openings.
- I. Vertical sections shall be mounted on steel channel sills continuous on four sides, or with steel channel sills on two sides and end cover plates.

## 2.4 WIREWAYS

- A. Structures shall contain a minimum 12 in (305 mm) high horizontal wireway at the top of each section and a minimum 6 in (152 mm) high horizontal wireway at the bottom of each section. These wireways shall run the full length of MCC to allow room for power and control cable to connect between units in different sections.
- B. A full-depth vertical wireway shall be provided in each MCC section that accepts modular plug-in units. The vertical wireway shall connect with both the top and bottom horizontal wireway and shall be isolated from unit interiors by a full height barrier. The vertical wireway shall be 4 in (102 mm) wide minimum with a separate hinged

door. There should be a minimum of 4,000 cu. in. of cabling space available. Access to the wireways shall not require opening control unit doors.

- C. Structures that house a single, full section control unit are not required to have vertical wireways. Those control units must open directly into the MCC horizontal wireways.
- D. All openings used for wiring shall have insulating grommets.

## 2.5 BUSSING

- A. All bussing and connectors shall be tin-plated or silver-plated copper. All bolted bus sections shall be silver-plated at the point of connection.
- B. The main horizontal bus shall be rated per the Drawings and shall extend the full length of the MCC. Bus ratings shall be based on 65° C maximum temperature rise in a 40° C ambient. Provide copper compression lugs of appropriate ampacity. Bottom plates shall be furnished when neutral bus is specified.
- C. Provisions shall be provided for splicing future additional sections onto the ends of the MCC.
- D. The horizontal bus splice bars shall be pre-assembled into a captive bus stack. This bus stack is installed into the end of the MCC power bus to allow the installation of additional sections. The main bus splice shall utilize four bolts, two on each side of the bus split, for each phase. Additional bolts must not be required when splicing higher amperage bus.
- E. Each section that accepts plug-in units shall be provided with a vertical bus for distributing power from the main bus to the individual plug-in starter units. This bus shall be of the same material and plating as the main bus, and shall be rated at 300 A continuous minimum. Provide 600 A vertical bus where required by loads. The vertical bus shall be connected directly to the horizontal bus stack without the use of risers or other intervening connectors. When a back-to-back unit arrangement is utilized, separate vertical bus shall be provided for both the front and rear units.
- F. A tin-plated copper ground bus shall be provided that runs the entire length of the MCC. The ground bus shall be 0.25 in (6.0 mm) x 2.0 in (50 mm) and be rated for 600 amps.
- G. Copper compression lugs shall be provided in the MCC for a 4/0-250 kcmil ground cables, two per each lineup. The ground bus shall be provided with (6) 0.38 in (10 mm) holes for each vertical section to accept customer-supplied ground lugs for any loads requiring a ground conductor.
- H. Each vertical section shall have a tin-plated copper vertical ground bus that is connected to the horizontal ground bus. This vertical ground bus shall be installed so that the plug-in units engage the ground bus prior to engagement of the power stabs and shall disengage only after the power stabs are disconnected upon removal of the plug-in unit.

- I. MCC's shall be rated for the available short circuit capacity as indicated on the Drawings.

## 2.6 TYPICAL UNIT CONSTRUCTION

- A. Units shall be service entrance rated and provided with:
  1. UL service entrance label.
  2. Ground bus.
- B. Provide NEMA Class IIS, type B wiring configuration. All wiring, relays, controls, ect. for each motor shall be located in the associated motor unit compartment.
- C. Provide all controls and accessories as shown on the equipment motor wiring diagrams in the Contract Drawings.
- D. All surfaces (back, side and bottom plates) of the unit interior shall be painted white.
- E. Units with circuit breaker disconnects through 400 A frame, and fusible switch disconnects through 400 A, shall connect to the vertical bus through a spring reinforced stab-on connector. Units with larger disconnects shall be connected directly to the main horizontal bus with appropriately sized cable or riser bus. Stabs on all plug-on units shall be solidly bussed to the unit disconnect. Cabled stab assemblies are not permitted.
- F. All conducting parts on the line side of the unit disconnect shall be shrouded by a suitable insulating material to prevent accidental contact with those parts.
- G. Unit mounting shelves shall include hanger brackets to support the unit weight during installation and removal. All plug-on units shall use a twin-handle camming lever located at the top of the bucket to rack in and out the plug-on unit. The cam lever shall work in conjunction with the hanger brackets to ensure positive stab alignment.
- H. A handle operator must be provided on each disconnect. With the unit stabs engaged onto the vertical phase bus and the unit door closed, the handle mechanism shall allow complete ON/OFF control of the unit disconnect with clear indication of the disconnects status. All circuit breaker operators shall include a separate TRIPPED position to clearly indicate a circuit breaker trip condition. It shall be possible to reset a tripped circuit breaker without opening the control unit door.
- I. A mechanical interlock shall prevent the operator from opening the unit door when the disconnect is in the ON position. Another mechanical interlock shall prevent the operator from placing the disconnect in the ON position while the unit door is open. It shall be possible for authorized personnel to defeat these interlocks.
- J. A non-defeatable interlock shall be provided between the handle operator and the cam lever to prevent installing or removing a plug-on unit unless the disconnect is in the OFF position.

- K. The plug-in unit shall have a grounded stab-on connector which engages the vertical ground bus prior to, and releases after, the power bus stab-on connectors.
- L. Provisions shall be provided for locking all disconnects in the OFF position with up to three padlocks.
- M. Unit construction shall combine with the vertical wireway isolation barrier to provide fully compartmentalized design.
- N. All conducting parts on the line side of the unit disconnect shall be shrouded by a suitable insulating material.
- O. Unit mounting shelves shall include hanger brackets to support the unit weight during installation and removal.
- P. With the unit stabs engaged into the vertical phase bus and the unit door closed, the handle mechanism shall allow complete ON/OFF control of the unit disconnect with clear indication of the disconnects status.
- Q. Unit construction shall combine with the vertical wireway isolation barrier to provide a fully-compartmentalized design.
- R. Up to a maximum of twelve six-inch units can be installed per vertical section without placement restrictions in new or existing applications.
- S. Each compartment shall be provided with a hinged door of pan construction on the front and a door opening of sufficient size so as to allow for ready removal of any of the components in the compartment. Doors shall open at least 90 degrees, and far enough to remove units without removing doors. A minimum of two hinges per door shall be provided. Doors 36 to 48 inches in height shall have a minimum of three hinges. Doors in excess of 48 inches shall have a minimum of four hinges.
- T. Each unit to be provided with a control panel for up to a maximum of four pilot devices. Control panel to be removable by loosening two semi-captive fasteners for access.

## 2.7 MCC COMPONENTS

### A. Combination Starters

1. All motor starters shall be combination motor circuit protector and contactor three pole, 60 Hertz, 600 Volt, magnetically operated, of the types shown on the Drawings. All motor starters shall have a 120 Volt operating coil.
2. NEMA sizes shall be as required for the horsepower shown on the Drawings, but shall not be less than NEMA Size 1. Verify final horsepower ratings before placing motor control centers into production.
3. All combination starters shall utilize a unit disconnect as specified above. Magnetic starters shall be furnished in all combination starter units.

4. All starters shall utilize NEMA rated contactors.
5. Starters shall be provided with a three-pole, external manual reset, overload relay for ambient compensated bimetallic thermal overload units.
6. Control circuit transformers shall be oversized, 100 VA minimum, and shall include two primary protection fuses and one secondary fuse (in the non-ground secondary conductor). The transformer shall be sized to accommodate the contactor(s), all connected control circuit loads, motor heaters and auxiliary relays and devices. The transformer rating shall be fully visible from the front when the unit door is opened.
7. When a unit control circuit transformer is not provided, the disconnect shall include an electrical interlock for disconnection of externally powered control circuits.
8. Auxiliary control circuit interlocks shall be provided where indicated.
9. Auxiliary interlocks shall be field convertible to normally open or normally closed operation.
10. NEMA Size 1 through size 4 starters shall be mounted directly adjacent to the wireway so that power wiring (motor leads) shall connect directly to the starter terminals without the use of interposing terminals. Larger starters shall be arranged so that power wiring may exit through the bottom of the starter cubical without entering the vertical wireway.
11. Auxiliary relays shall be 600V, 10 amp, heavy duty type and located within the associated equipment's starter bucket. Timing relays shall be true on and true off type.
12. Motor circuit protectors shall be molded case 600 Volts, 3 Pole, 60 Hertz with adjustable magnetic trip settings. Motor circuit protectors shall have toggle type, quick-make/quick-break, overcenter switching mechanism and auxiliary disconnect contacts when used with starters having external control circuits. Rating selected shall provide complete protection of, and coordination with, motor starter overload relays and heaters. Electrical FSB shall verify the motor horsepower and install rating as required by the NEC for the full load current of the motor actually installed. Motor circuit protectors shall be furnished with bolt on current limiting fuses.
13. All starters shall be provided with run timers. Running time meters shall be 3-1/2 inch square case; non-reset, 99,999.9 hour range
14. Control stations shall be standard 30mm sizes, heavy-duty, oiltight type.
15. Indicating light shall be LED type, with push-to-test features.
16. Provide all controls and accessories as shown on the equipment motor wiring diagrams in the Contract Drawings. Specialized interface relays supplied by the equipment manufacture shall be installed in the each associated motor MCC bucket

by the MCC manufacture at the MCC manufacturing plant. Coordinate with the equipment manufacture for space requirements and delivery of the relays

#### B. Terminal Blocks

1. Provide Type B wiring with all starter units provided with unit control terminal blocks.
2. Terminal blocks shall be the pull-apart type 600 volt and rated at 25 amps.
3. All current carrying parts shall be tin-plated.
4. Terminals shall be accessible from inside the unit when the unit door is opened.

#### C. Nameplates and Identification

1. Provide engraved phenolic nameplates for each MCC and unit compartment screwed to the doors of each individual compartment and wiring diagrams pasted inside each door.
2. Compartments containing panel boards shall have a card-holder on the inside of the door. Compartments containing motor starters shall have an overload heater selection table pasted inside the door.
3. Provide with white background with black letters, measuring a minimum of 1.5 in (38 mm) x 6.25 in (159 mm).
4. Each motor control center shall be furnished with a sign marked "DANGER - HIGH VOLTAGE - KEEP OUT!". Letters shall be not less than one inch high. Signs shall be laminated plastic, engraved red letters with a white background.
5. All compartments with voltages from sources outside of the compartment shall have a sign on the compartment door marked "CAUTION - THIS UNIT CONTAINS A VOLTAGE FROM A SOURCE OUTSIDE THIS UNIT". Letters shall be black on a high visibility yellow background. Background shall be vinyl approximately three inches by five inches.

## 2.8 WIRING

- A. All wiring shall be copper.
- B. Compartment wiring shall be no. 14 AWG minimum, and connected to compartment mounted, plug-in terminal blocks that allow compartments to be withdrawn without having to remove wires from fixed terminal blocks.
- C. Power wiring shall be black in color, control wiring shall be red in color, wiring energized from sources other than the starter control power transformer shall be yellow in color. No deviations from this wiring scheme shall be accepted.

## 2.9 MCC FINISH

- A. All steel parts shall be provided with UL and CSA listed acrylic/alkyd baked enamel paint finish, except plated parts used in bus connections.
- B. All painted parts shall undergo a multi-stage treatment process, followed by the finishing paint coat.
- C. Pre-treatment shall include:
  - 1. Hot alkaline cleaner to remove grease and oil.
  - 2. Iron phosphate treatment to improve adhesion and corrosion resistance.
- D. The paint shall be applied using an electro-deposition process to ensure a uniform paint coat with high adhesion.
- E. The standard paint finish shall be tested to UL 50 per ASTM B117 (5% ASTM Salt Spray) with no greater than 0.125 in (3 mm) loss of paint from a scribed line.
- F. Paint color shall be #61 light gray per ANSI standard Z55.1-967 (60-70 gloss) on all surfaces unless specified otherwise.
- G. Control station plates and escutcheon plates shall be painted a contrasting gray.
- H. All unit interior saddles shall be painted white for better visibility inside the unit.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Motor control centers shall be bolted to angle iron sills. The sills shall be imbedded in a smooth, level raised concrete pad on the on the two longest sides. The sills shall be the full length of the motor control center and shall be installed level in all directions. Where motor control centers are installed back to back, or against a wall they shall be secured to the wall or adjacent MCC by means of a channel support.
- B. Field installed interior wiring shall be neatly grouped by circuit and bound by plastic tie wraps. Circuit groups shall be supported such that circuit terminations are not stressed.
- C. Motor control centers shall be maintained in an upright position at all times. Lifting shall be only at the floor sills or the top mounted lifting angle.
- D. The motor control shall be protected against damage at all times. Any damage to the paint shall be carefully repaired using touch-up paint furnished by the motor control center manufacturer.
- E. Install all required interlock wiring.

- F. Motor control center section shall be arranged such that all large and/or heavy components are located in the lower spaces of the various section. Top heavy sections shall be avoided.

### 3.2 SPARE PARTS

- A. Provide the following spare parts to the Owner:

1. Indicating lamps, 4 of each type.
2. Control switches, 2 of each type.
3. Overload heaters, 1 of each type installed.
4. Starter and relay coils, 2 of each type.
5. Fuses, 3 of each type

### 3.3 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16443

## SECTION 16495

### VARIABLE FREQUENCY DRIVES

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes furnishing all labor, materials, tools and equipment necessary to furnish and install Variable Frequency Drives (VFD) as shown on Drawings, specified herein, or evidently required to complete the work.
- B. Refer to various DIVISION 11 sections and E-Drawings control wiring diagrams for field device interface.
- C. Refer to I-Drawings for additional requirements.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Shop Drawings showing complete fabrication and construction details, materials, electrical components, enclosures, input line reactors, harmonic filters, weights, dimensions, clearances, anchorage locations, piping and utility requirements, and step by step sequence of controls.
  - 2. Certified Performance and Efficiency Characteristics.
  - 3. Provide the VFD manufacturer with copies of all motor shop drawing submittals and or nameplate data. The VFD manufacturer shall review this data and shall certify in writing that the equipment has been coordinated with the variable frequency drives and motors for complete compatibility.
  - 4. Harmonic Analysis and written summary report.
  - 5. Complete master wiring diagrams, VFD layout Drawings and control schematics, including required coordination with other electrical control devices operating in conjunction with each VFD and suitable outline Drawings shall be furnished for each VFD being supplied for approval before proceeding with manufacture. Due to the complexity of the control functions, it is imperative the above Drawings be

clear and carefully prepared to facilitate interconnections with other equipment. Standard preprinted sheets or Drawings simply marked to indicate applicability to this contract will not be acceptable.

#### 1.4 QUALITY ASSURANCE

- A. Each VFD unit shall be U.L. listed or labeled.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.
- B. The materials and components shall be stored on a flat, clean surface to prevent damage and shall be covered to prevent exposure to adverse conditions prior to installation.

#### 1.6 DESIGN CRITERIA

- A. The materials and equipment covered by this specification are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's recommendations and the Contract Documents. The specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.
- B. Provide enclosed type individual constant torque VFD's with LCL line filters and low harmonic drives. Each individual VFD requires all these devices to be factory mounted within its enclosure. Field mounting of drive related accessories is unacceptable.
- C. All equipment submitted shall be provided with enclosures that can be installed in the spaces shown on the Drawings. Enclosures that exceed the allowable space provided shall be subject to rejection.
- D. Heat dissipation from VFD enclosures shall meet all requirements of the specifications.
- E. Under normal operating conditions, the line harmonics introduced into the power system from the AC VFD unit(s) shall be within the distortion limits as defined in IEEE 519 and less than %5 Ithd. The point of common coupling shall be the main distribution panel.
- F. All VFDs shall be low harmonic drives for the wastewater and water industry meeting the requirements of IEEE-519 as manufactured by ABB, Eaton or General Electric.

### PART 2 –PRODUCTS

#### 2.1 DRIVES

- A. This specification is intended to outline the overall physical features, performance and functional requirements of the VFD equipment required under this section, consisting

of a variable speed adjustable frequency converter, filters, accessories, and enclosure. The VFD system shall be fully tested by the manufacturer before initial startup with all components compatible in function and appearance.

B. Variable Speed Adjustable Frequency Converter. The adjustable frequency drive modules shall be UL Listed solid state type in a NEMA 12 filtered enclosure and blower cooled. The filter element shall be of the removable and replaceable type for each drive unit. Front access shall be provided. Top, rear and side access shall not be required. The enclosure shall be coated with an epoxy resin base and acrylic resin enamel finish. The drive shall meet applicable provisions of DIVISION 16, ELECTRICAL, the National Electric Code and NEMA. The drive shall be arranged for 480 Volts plus 10 percent to minus 5 percent, three phase, 57 to 63 Hertz input converted into adjustable frequency/Voltage output in an ambient temperature of -10 to 40 degrees C. The VFD shall be capable of sustaining operation with a line voltage dip of 15 percent of normal operating voltage on a constant torque or variable torque load. During line dip the VFD shall automatically provide a speed drop allowing maximum capable speed for the duration of the input voltage dip. Each individual drive shall be mounted in a separate enclosure. The drive efficiency shall be 97 percent or better at full speed and full load. Fundamental power factor shall be 0.98 at all speeds and loads. Each individual drive and associated equipment shall be mounted in a single and individual enclosure unless otherwise specified. The following features shall be included with each adjustable frequency drive:

1. Control. The control method shall be sinusoidal Pulse Width Modulation. Output Voltage shall be three phase, 480 Volts and output frequency shall be 0.1 to 66 Hz when shipped. Frequency shall be selectable by a digital keypad. The frequency resolution shall be 0.1 Hz and the accuracy shall be within 1.0 percent of the maximum frequency at 25 degrees plus or minus 10 degrees C. Voltage/frequency (V/f) characteristics shall be characterized by selectable patterns. Up to 82 control functions shall be programmed. The overload capacity shall be 110 percent continuous and a minimum two minute rating of 150 percent of rated current. The frequency setting signal shall be 4 to 20 mA. The VFD shall employ a full wave rectifier to prevent input line notching, DC bus choke, DC bus capacitors, and Insulated Gate Bipolar Transistors (IGBT's) as the output switching device. SCRs, GTOs and Darlington transistors are not acceptable.
2. Function. The adjustable parameters consisting of: accelerating time, decelerating time, upper and lower limit of output frequency, and 4 to 20 mA reference bias and reference gain shall be indicated on a digital display. Braking shall be achieved through capacitor charging and starting shall be achieved by external contact. The VFD shall be software configurable to automatically restart following power outage, overcurrent and overvoltage detection. Soft stall shall occur when motor runs continuously at overload.
3. Protection. The drive shall be protected from stalling, overcurrent, overload, short circuit, overvoltage, undervoltage, loss of one (1) phase of input power, instantaneous power failure (approximately 30 msec), overheating, fuse burnout protection and earth (ground) fault detection. The fault cause shall be displayed (flickering) for overcurrent, short circuit, overload, overvoltage, overheating and

earth (ground) fault. There shall be a main capacitor charging indicator for internal circuit. Fault shall be reset by a reset push button on the printed circuit board and an external reset contact.

4. Displays. The digital display shall be a 2 line, 40 character unit with readout in plain English. A separate LED indicator shall be provided for capacitor charge. Display shall be located on the door of the VFD enclosure.
5. Internally mounted set point control shall be provided to receive either a 4 to 20 mA or 0 to 10 vdc analog input control signal from a process panel to control the speed of the motor. An external digital display shall be provided outside of the inverter. The following control devices shall be available for external control of the inverter; frequency/speed meter, frequency setting variable resistor, knob for frequency setting variable resistor and drive switch. The drive shall be capable of receiving a dry contact input to override the analog input control signal and control the flow rate to 95%.
6. A lockable main load break disconnect switch interlocked with the enclosure door with through the door handle to provide positive disconnect of incoming AC power shall be furnished for each individual drive and enclosure. The circuit breaker shall be rated at a minimum 25,000 amperes at 480 volts, RMS symmetrical.
7. Each drive shall be provided with the following accessories:
  - i. "Local-Off-Remote" keypad switch for local/remote speed control. In the "Remote" mode, the motor speed shall be adjusted in response to the related remote 4 to 20 mA pacing signal. In "Local" mode the motor speed shall be adjusted in response to keypad entry speed and the VFD shall run when the "Hand-Off-Auto" selector switch is in "HAND". . In "Off" mode the VFD shall not run.
  - ii. Provide a 4-20 mA speed feedback output signal.
  - iii. Provide four (4) Type C dry contacts at each VFD for remote indication of motor running status.
  - iv. "Hand-Off-Auto" selector switch located on the door of the VFD enclosure. In the "Auto" position the VFD shall be started and stopped remote via an external dry contact. In the "Hand" position the VFD shall run. In "Off" mode the VFD shall not run.
  - v. Elapsed time meters located on the door of the VFD enclosure.
  - vi. Provide two (2) type C contacts at each VFD for remote indication of VFD run and fault conditions.
  - vii. Motor running indicating light located on the door of the VFD enclosure.
  - viii. Motor off indicating light located on the door of the VFD enclosure.
  - ix. Drive failure indicating light located on the door of the VFD enclosure.
  - x. All indication lights pushbutton shall be LED push to test type.
  - xi. All delay time relays shall be true-off and true-on type delay relays.
  - xii. Provide all controls and accessories as shown on the equipment control wiring diagrams in the E-Drawings and as shown on the I-Drawings. Specialized interface relays supplied by the equipment manufactures shall be installed in the VFD cabinet by the VFD manufacturer at the VFD manufacturing plant.

Coordinate with the equipment manufacturer for space requirements and delivery of the relays.

C. VFD enclosures shall be coated with an electrostatically-applied epoxy enamel.

### PART 3 – EXECUTION

#### 3.1 INSTALLATION

- A. All materials and equipment shall be installed in a neat, workmanlike manner.
- B. Installation of the equipment shall be in accordance with written instructions provided by the manufacturer and as approved.

#### 3.2 MANUFACTURER'S FIELD SERVICES

- A. Manufacturer's Field Services shall be provided for installation and startup for all the VFDs provided.
- B. Manufacturer's Field Services shall be a minimum of two (2) calendar days.

#### 3.3 MANUFACTURER'S TRAINING

- A. Manufacturer's training shall be provided for training of Owner's personnel for each type of VFD provided.
- B. Manufacturer's Training of Owner's Personnel shall be a minimum of two (2) calendar days performed at the project site.

#### 3.4 SPARE PARTS

- A. One set of spare parts shall be provided for each VFD size.
- B. Spare parts for each VFD Size:
  - 1. One (1) control interface.
  - 2. Three (3) fuses.
  - 3. One (1) VFD module each size provided without enclosure.

#### 3.5 WARRANTY

- A. A manufacturer warranty for three years shall be provided for each VFD.

#### 3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16495

## SECTION 16500

### LIGHTING SYSTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes the furnishing and installing of complete lighting systems including panelboards, transformers, lighting fixtures, receptacles, switches, contactors, clocks and all accessories and appurtenances required as specified herein and as shown on the Drawings.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Light Switches
  - 2. Occupancy Sensors
  - 3. Receptacles
  - 4. Astronomical Digital Time Clock Switch
  - 5. Lighting Fixtures
  - 6. Device Plates
  - 7. Emergency Lighting Battery Units and Exit Lights

##### 1.4 QUALITY ASSURANCE

- A. All lighting fixtures shall be in accordance with the National Electrical Code and shall be constructed in accordance with the Underwriters Laboratories “Standards for Safety, Electric Lighting Fixtures.” All lighting fixtures shall be Underwriters Laboratories labeled.
- B. Exterior light fixtures shall be in accordance with local zoning requirements.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## PART 2 –PRODUCTS

### 2.1 LIGHT SWITCHES

- A. NEMA WD 1, UL 20, Heavy-Duty, AC only general-use toggle switch.
- B. Rated 20 Amperes, 120/277 Volts for inductive and resistive loads.
- C. Totally enclosed in a phenolic base and cover.
- D. U.L. Listed.

### 2.2 OCCUPANCY SENSORS

- A. Occupancy sensor single circuit wall switch with dual technology (ultrasonic and passive infrared) and manual button control shall be equal to No. LHMTS1 as manufactured by Hubbell or equal by Leviton, Legrand or equal.
- B. Switch to be manual on operation except for bathrooms which shall be auto on operation.
- C. Rated 800W Incandescent/ Electronic, Ballast/ LED Driver, 1,000W Magnetic Ballast, 1/6 HP Motor.
- D. Occupancy (auto-ON) and Vacancy (manual-ON) operating modes.
- E. Casing - high - impact injection – molded plastic (UL–94–5V Impact-resistance lens)
- F. U.L. Listed.

### 2.3 RECEPTACLES

- A. NEMA WD 1, UL 498, Heavy-duty general use receptacle.
- B. GFCI Receptacle: UL 943, Convenience receptacle with integral ground fault circuit interrupter and indication light that is lighted when device is not tripped.
- C. NEMA WD 6, straight blade type for rated current and phases as indicated on Drawings.
- D. Weatherproof Cover Plate: NEMA 3R, thermoplastic while use type covers by Hubbell or equal

## 2.4 ASTRONOMICAL TIME CLOCK SWITCH

- A. Astronomical Time Clock Switch shall be programmable astronomically controlled switch front LCD time display and programmable buttons mounted in a standard back box.
- B. The switch shall be 1-pole, 15 Amp rated and capable of 7-day week time scheduling, equal to Leviton VPT24-1PZ Vizia by Leviton or equal by Hubbell or Legrand.
- C. Operation: Exterior lights shall be energized when the astronomical dusk time of day dial is past time. The lights shall remain energized until either the "Off" time of day or astronomical dawn time of day is past time.

## 2.5 LED LIGHT FIXTURES

- A. The fixture shall be tested to IESNA LM-79-08 and LM-80 Testing Standards at 25° C ambient temperature.
- B. The LED package shall be designed around the lumen maintenance of 87% at 60,000 hrs. and is to be expected to achieve L70 at 100,000 hrs.
- C. The Light Engine shall be a high efficacy LED light engine equipped with brand-name LEDs available in outputs of 100%, 85%, 70% and 55
- D. The LED Drivers shall be Electronic Class 2, high efficiency with the following power factor correction (PFC):
  - 1. Standard Non-Dimming Driver (PFC>0.95).
  - 2. Dimming Drivers (PFC>0.90).
- E. All exterior light fixtures shall be dark sky compliant.

## 2.6 DEVICE PLATES

- A. Plates shall be of the required number of gangs for the application involved and shall be Type 302 (18-8) high nickel stainless steel of the same manufacturer as the device.

## 2.7 EMERGENCY LIGHTING BATTERY UNITS AND EXIT SIGNS

- A. Emergency lighting units shall be fully automatic with nickel cadmium or lithium-ion batteries. The wattage of the unit shall be sufficient to power the remote lamps as shown on the Contract Drawings, plus 20% spare capacity, for 1-1/2 hour upon loss of AC power. Units shall be designed for 120 Volt, 60 Hertz input and have an automatic clock timer and solid state charger, ready/off switch, press-to-test switch, amber "ready" light, red "charge" light and required number of supervisory relays.
- B. Provide Holophane DeSoto DSL46 series emergency lighting units, in NEMA 4 or 4X areas, Holophane DeSoto DSL3 series in NEMA 12 areas, and Holophane

Cortez CZQ6L in NEMA 1 areas. Units manufactured by Hubbell, Dual Lite or approved equal are also acceptable. Lighting heads shall be 1100 lumens, LED type.

- C. Provide exit signs with LED lamps, nickel cadmium battery, battery charger, white background with red lettering. In NEMA 1 and 12 areas provide Holophane QM-LED series and in NEMA 4X areas provide Holophane DLTX series. Equivalent units manufactured by Dual Lite, Sure Lite or approved equal are acceptable.
- D. Provide remote wall mounted lamp heads sealed wet location rated thermoplastic, 1100 lumens, LED type with weatherproof mounting base by Holophane. Equivalent units manufactured by Hubbell, Dual Lite or approved equal are acceptable.

### PART 3 – EXECUTION

#### 3.1 INSTALLATION

- A. Each fixture shall be a completely finished unit with all components, mounting and/or hanging devices necessary, for the proper installation of the particular fixture in its designated location and shall be completely wired ready for Connection to the branch circuit wires at the outlet. All pendant mounted fixtures shall be mounted plumb with floors and walls.
- B. When fixtures are noted to be installed flush, they shall be complete with the proper accessories for installing in the particular ceiling involved. All flush mounted fixtures shall be supported from the structure and shall not be dependent on the hung ceilings for their support.
- C. Flexible fixture hangers shall be used for all pendant mounted fixtures.
- D. Receptacles and switches shall be mounted at 45” above finished floor.
- E. Mounting heights given are to the bottom of the fixture. When “mount up” is indicated, fixture is to be mounted the stated distance off the finished floor.

#### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16500

## SECTION 16601

### LIGHTNING PROTECTION SYSTEMS

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this subsection includes the furnishing and installing of a complete lightning protection systems for the Water Treatment Plant Building, Well #2 Building, Well #3 Building, and Well #4 Building in compliance of the latest “Code for Protection Against Lightning” for structures as adopted by the National Fire Protection Association and the Underwriters Laboratories, Inc. for a Master Label system.
- B. The Electrical Subcontractor shall retain the services of a UL listed Master Label Lightning Protection design/build firm to provide certified design plans, manufacture specification sheets, and installation instruction for submittal review and installation services for a complete UL listed Master Label Lightning Protection system for each building and includes requirements for lightning protection systems components.
- C. Building Lightning protection systems shall coordinate with all building systems as shown in the Contract Documents including but not limited to the Architectural, Structural, Electrical, HVAC, Plumbing and Fire Protection systems where bonding is required.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Scaled Drawings detailing lightning protection system including, but not limited to, air terminal locations, conductor routing, connections and grounding conductor sizes and termination details.
  - 2. Manufacturer's Installation instructions.
  - 3. Air terminals.
  - 4. Bonding plates.
  - 5. Conductors.

6. Connectors.
7. Fasteners.
8. Grounding rods.
9. Rod clamps.
10. Splicers.
11. Roof Adhesive where used

#### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

#### 1.5 DESIGN CRITERIA

- A. Installer Qualifications: Engage an experienced Installer to install lightning protection system. An experienced Installer is defined as an installer who has over 10 years' experience in the installation of lightning protection systems.
- B. Electrical Component Standard: Provide work complying with applicable requirements of State Electrical Code.
- C. NFPA and UL Compliance: Comply with requirements of NFPA Standard 780, and UL Standard 96 and 96A as applicable to lightning protection systems for building projects.
- D. LPI Compliance: Comply with requirements of Lightning Protection Institute (LPI) Standards 175, 176, and 177, pertaining to lightning protection system material, components, installation and quality assurance procedures.
- E. ANSI Compliance: Comply with applicable requirements of ANSI Standard C2.

### PART 2 –PRODUCTS

#### 2.1 CONDUIT

- A. Conduit shall be specified under SECTION 16130, RACEWAYS AND FITTINGS.

#### 2.2 GROUND RODS

- A. Ground rods shall be as specified under SECTION 16060, GROUNDING SYSTEM.

### 2.3 FASTENERS, CLAMPS, CONNECTORS, LUGS, BOLTS, ETC.

- A. Fasteners, Clamps, Connectors, lugs, bolts etc. shall be copper or an approved type of non-corrosive metal.

### 2.4 AIR TERMINALS

- A. Building air terminals shall be 3/8 inch by 12 inch solid copper and shall extend at least 10 inches above the object to be protected. Spacing of Air terminals shall not exceed 20 feet apart on the ridge of the roof. The Air terminal base shall be suitable for the roof (tile, slate, concrete, flat, sloping etc.).

### 2.5 CONDUCTORS

- A. Conductors shall consist of 32 strands of 17 gauge copper wire weighing 215 pounds per 1,000 feet.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Conductor fasteners shall be spaced not to exceed 3 feet on centers.
- B. All metal bodies within 6 feet of the conductor shall be bonded to the system with approved fittings and conductor. Connections between dissimilar metals shall be made with approved bimetallic connections.
- C. The lightning protection system shall be bonded to the associated building's grounding system.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16601

## SECTION 16612

### ENGINE GENERATOR

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this section includes all labor, materials, tools, equipment and incidentals necessary to furnish and install, put in operation and field test quantity a natural fired engine driven generator with sound attenuated weatherproof enclosures of the size and ratings as specified herein and on the Drawings.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Manufacturer and model of engine and generator
  - 2. Rated capacity B.H.P.
  - 3. Generator
  - 4. Generator KVA, KW and P.F. rating
  - 5. Voltage
  - 6. Class insulation
  - 7. Temperature rise above 40 degree C ambient
  - 8. Generator efficiency and fuel consumption at full load, 3/4 load and 1/2 load
  - 9. Operating weight and noise levels of complete unit
  - 10. Exhaust piping
  - 11. Battery and charger
  - 12. Auxiliary system power requirements and wiring diagrams.

13. Enclosure with all conduit openings for system operation identified.
14. Manufacturer's certified test record. The test record shall show the generator performance and frequency regulation to satisfy the requirements specified herein, and shall also show fuel consumption rates at 1/2 load, 3/4 load and full rated load.

#### 1.4 QUALITY ASSURANCE

- A. The generator unit shall be the standard product, as modified by these Specifications, of a manufacturer regularly engaged in the production of this type of equipment. Engine generator unit shall be a standard production model of proven ability and shall be designed, constructed, and installed in accordance with the best practice and methods. In addition, the manufacturer shall maintain a permanent service organization and supply of spare parts as necessary to provide adequate service within 60 miles of the site.
- B. The engine generator shall be a factory assembled unit specifically designed and fitted for operation on natural gas. The engine generator unit shall be free from injurious torsional or other vibration, and shall be assembled on an adequate steel subbase suitable for mounting on vibration isolation pads, on a flat concrete surface which is suitable for supporting the weight of the unit. The vibration installation material shall be furnished with the engine generator unit.
- C. The engine generator unit shall be designed and built in accordance with the latest standards of IEEE, NEMA, ANSI and ASME.
- D. The engine generator unit shall be designed to minimize the danger of accidents to operating and maintenance personnel. The manufacturer shall, prior to shipment, verify that all electrical connections are tight and that circuits are isolated, that on-set piping connections are well-made, and that standard safety equipment is included and functions according to design.
- E. Tests
  1. At least 48 hours prior to the load test, the manufacturer shall perform a pretest. The pretest shall be conducted in the presence of the Engineer. The pretest shall determine that the unit is ready for load testing and that all components are functioning correctly. All adjustment for tuning the unit shall be made during the pretest. If remedial work is required, the work shall be performed before the load test is conducted.
  2. Upon completion of the installation, the manufacturer of the equipment shall test the complete unit, at full load, using load banks, for four continuous hours. During the test, the following data shall be taken at 15 minute intervals:
    - i. Outside air temperature
    - ii. Generator enclosure temperature
    - iii. Oil pressure
    - iv. Oil temperature

- v. Jacket water temperature
  - vi. Battery charge rate
  - vii. Fuel pressure
  - viii. A.C. Volts
  - ix. A.C. Amps
  - x. Frequency
  - xi. Kilowatts
3. Following the test, three successive simulated power outages shall be conducted using all connected building load.
  4. The equipment shall be left in good operating order and the settings of all alarm and shutdown devices verified.
  5. Provide on-site sound measuring testing to assure specified maximum sound levels are not exceed at full load, provide test report.

F. Warranty/Service

1. The manufacturer's and dealers Extended Service Coverage shall in no event be for a period of less than five (5) years from date of Owner/Engineer's acceptance of the system and shall include repair parts, labor, travel expense necessary for repairs at the jobsite, and expendables (lubricating oil, filters, antifreeze, and other service items made unusable by the defect) used during the course of maintenance and repair. Applicable deductible costs applying only after the first year shall be specified in the manufacturer's warranty. Submittals received without written warranties as specified will be rejected in their entirety. Warranty and maintenance shall be issued and executed by the dealer and may not be subcontracted.
2. The generator set supplier shall have factory trained service representatives and tooling necessary to install, test maintain, and repair all provided equipment and shall be located within 150 miles of the customer's site.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.
- B. Protect material and equipment, in accordance with the manufacturers recommended storage procedures, before, during, and after installation. Stored items shall be protected from the weather and contamination. During installation, piping and similar openings shall be capped to keep out dirt and other foreign matter.

1.6 DESIGN CRITERIA

- A. The engine generator units shall comply with the requirements of the Federal Environmental Protection Agency and State of Massachusetts Department of Environmental Protection.

- B. The engine generator unit shall be arranged for automatic starting and stopping on failure of, and restoration of the normal source of power, and for automatic load transfer, but not including the automatic load transfer switch which will be furnished separately.
- C. The engine generator unit shall include, but not be limited to excitation system, controls, keep warm system, cooling system, silencer, starting batteries, charger, and all essential and desirable appurtenances whether specifically mentioned in this specification or not.
- D. The system described herein, including but not necessarily limited to the engine generator set, engine auxiliaries, batteries and engine generator control panels shall be furnished by a single supplier who is regularly engaged in the production of natural gas fired engine driven generators.
- E. The voltage regulation shall be within plus or minus two percent from no load to full rated load. On application or removal of full rated load in one step, the transient voltage dip or overshoot shall not exceed twenty percent of rated voltage. Frequency regulation shall be within 3 Hertz from no load to full load.
- F. The voltage regulator shall be insensitive to severe load induced waveshape distortion from SCR or thyrister circuits such as those used in battery charging (UPS) and motor speed control equipment. This SCR immune regulator shall not reduce the motor starting capabilities as specified herein.
- G. An engine generator unit of not less than the KW rating shown on the Drawings, 0.8 power factor capacity. Three (3) phase, 60 Hertz, 480 Volts, 4 wire (grounded wye) alternating current generator shall be furnished.
- H. The engine generator unit shall be completely prewired and piped so that only field connections to a master terminal strip for control, auxiliaries and alarms, and power connections to a molded case line circuit breaker and fuel line connections will be required.
- I. The engine generator unit and associated auxiliaries systems and components shall be skid mounted and installed indoors.

#### 1.7 ENGINE GENERATOR UNIT PERFORMANCE

- A. The engine generator unit shall maintain rated frequency from no load to full rated load.
- B. The voltage regulation shall be as specified herein and recovery to steady state operation shall be within two seconds.
- C. Stable or steady state operation is defined as operation with terminal voltage remaining constant within plus or minus one percent of rated voltage. A rheostat shall provide a minimum of plus or minus five percent voltage adjustment from rated voltage.

- D. Frequency regulation shall be maintained within 2-1/2 percent of rated frequency from no load to full load. The steady state frequency shall be within 0.5 percent of rated frequency.
- E. The engine shall be equipped with a electronic isochronous governor capable of maintaining the engine speed from no load to full load within plus or minus .25 percent of the synchronous speed.

## PART 2 –PRODUCTS

### 2.1 ENGINE

- A. The engines shall be natural gas fueled, four (4) cycle, water-cooled, while operating with nominal speed not exceeding 1800 RPM. The engine shall meet applicable EPA non-road mobile regulations and/or the EPA NSPS rule for stationary reciprocating compression ignition engines. Additionally, the engine shall comply with the State Emission regulations at the time of installation/commissioning. Actual engine emissions values must be in compliance with applicable EPA emissions standards per ISO 8178 Emissions Cycle at specified ekW/bHP rating.
- B. The engine shall be furnished with thermostatically controlled jacket water heaters of the size recommended by the supplier. Heaters shall be rated for operation on 208 Volts.
- C. The oil sump will be fitted with pipe nipples, a ball valve, and an extension oil drain.
- D. The engine shall be provided with a governor which maintains the frequency within a bandwidth of the rated frequency, over a steady-state load range of zero to 100% of rated output capacity. The governor shall be configured for safe manual adjustment of the speed/frequency during operation of the engine-generator set, without special tools, from 90 to 110% of the rated speed/frequency, over a steady state load range of 0 to 110% or rated capacity.
  - 1. Steady state speed band, +/- 0.25% of rated speed.
  - 2. Internal oil pump, relief valve and accumulator controls governor operating pressure.
  - 3. Manual speed adjustment knob at top of unit.
  - 4. Positive locking to allow manual speed adjustment.

### 2.2 COOLING SYSTEM

- A. The engine shall be furnished with a unit mounted radiator. The radiator shall be of sufficient size to cool the water when ambient temperature is 100 degrees F. and the engine generator unit is operating at full rated load continuously.
- B. Cooling system shall further include water cooled manifolds, pusher fans and high temperature cutout. Provide radiator duct connector complete with suitable gasket,

bolts and nuts. The cooling system shall be furnished with sufficient antifreeze solution to protect the cooling system with ambient air temperature down to minus fifty degrees F.

- C. Provide an anti-freeze treatment as recommended by the manufacturer for protection against corrosion and scale formation. The anti-freeze treatment shall be compatible with the antifreeze solution. The anti-freeze will be long life environmentally friendly polypropylene glycol. The concentration will be as recommended by the manufacturer.

## 2.3 FUEL SYSTEM

- A. The engine shall be equipped with a complete base mounted gas fuel system rated for 7 to 11 inch H<sub>2</sub>O incoming gas pressure including:
  - 1. Fuel line solenoid valve.
  - 2. Flexible fuel connectors
  - 3. Fuel injection system.
  - 4. Dry fuel filters
  - 5. Manual shutoff valve
  - 6. Pressure Gauge
  - 7. Fuel regulator and any other components normally supplied or recommended by the manufacturer for this application.

## 2.4 EXHAUST SILENCERS

- A. The engine generator unit shall be provided with a critical type silencer including flexible exhaust fittings. Mounting shall be provided within the enclosure by the Manufacturer. Silencers shall be mounted so that its weight is not supported by the engine. Exhaust piping shall be sized as recommended by the manufacturer. Connection between engine and silencer shall be of the flexible type.
- B. Silencers shall be Maxim Model M41, equal by Kitell, or equal for naturally aspirated engines. Silencers shall be Maxim MT41 equal by Kitell, or equal for turbocharged engines.
- C. A flexible section shall be provided at each engine and an expansion joint at each muffler. Flexible sections and expansion joints shall have flanged connections. Flexible sections shall be made of convoluted seamless tube without joints or packing. Expansion joints shall be the bellows type. Expansion and flexible elements shall be stainless steel suitable for gas-engine exhaust gas at the maximum exhaust temperature that is specified by the engine manufacturer. Expansion and flexible elements shall be capable of absorbing vibration from the engine and compensation for thermal expansion and contraction.

- D. Horizontal sections of exhaust piping shall be sloped downward away from the engine to a drip leg for collection of condensate with drain valve and cap. Changes in direction shall be long radius. Exhaust piping, mufflers and silencers installed shall be insulated with 3 inches of calcium silicate insulation and covered with aluminum flashing to protect personnel.
- E. All portions of the exhaust system shall be insulated and covered with flashing.

## 2.5 STARTING SYSTEM

- A. The electric starting system shall consist of the following equipment:
  - 1. The engine shall have a two wire, direct current starter suitable for automatic starting through the load transfer switch.
  - 2. Batteries shall be of the lead-acid type. Batteries shall be guaranteed to have sufficient capacity when in a fully charged state to perform not less than five, 15 second cranks while in an ambient temperature of 0 degrees F without recharging.
  - 3. Current limiting type automatic battery charger conforming to UL 1236 shall be of the static type, magnetic amplifier control with D.C. voltmeter, D.C. ammeter and potentiometer for voltage adjustment. Charger to be completely automatic, charging rate to be determined by the state of the battery, and reducing to milliamp current on a fully charged battery. Charger shall be for 120 Volt, single phase, 60 Hertz A.C. input with an output of not less than 10 amperes. The charger shall be for the correct voltage for the battery, and specifically for charging a lead-acid battery and for panel mounting. The charger shall be furnished with a battery under-voltage alarm system consisting of dry contacts for remote use.

## 2.6 ALTERNATOR

- A. The alternator shall be single bearing, open, dripproof revolving field, four pole brushless type, permanently aligned to the engine by flexible disc coupling. Each unit shall be reconnectable type having nine leads and shall be factory connected for three phase, 4 wire, 60 Hertz. The rating of the unit shall be as hereinbefore specified.
- B. Alternators shall have Class H insulation provided with a 2/3 pitch rated for use with non-linear variable frequency drive loads and shall be furnished with Amortisseur windings. Alternators shall have a complete static automatic voltage regulator which will hold the voltage within plus or minus two percent from no load to full rated load. On application of rated load in one step, the transient voltage dip shall not exceed twenty percent. The generator windings shall be braced to withstand any possible short circuit stresses. Alternator shall be "Radio Interference Proof" (RIP) and "Telephone Influence Factor" (TIF) and shall be within the limits of Section 9, ANSI C50.12. Alternators shall have a rotating brushless exciter and rectifier.
- C. The alternator characteristics shall be matched to the torque characteristics of the engine in such a manner that with full load connected to the alternator terminals, the alternator will utilize all the available engine power without exceeding it at all speeds.

- D. The generator exciter shall be of the brushless type. Semiconductor rectifiers shall have a minimum safety factor of 300% for peak inverse voltage and forward current ratings for all operating conditions, including 110% generator output at 40 degrees C 104 degrees F ambient. The exciter and regulator in combination shall maintain generator-output voltage within the limits specified.
- E. Each generator shall be provided with a solid-state voltage regulator, separate from the exciter. The regulator shall maintain the voltage within a bandwidth of the rated voltage, over a steady-state load range of zero to 100% of rated output capacity. Regulator shall be configured for safe manual adjustment of the engine-generator voltage output without special tools, during operation, from 90 to 110% of the rated voltage over the steady state load range of 0 to 100% of rated output capacity. Regulation drift shall not exceed plus or minus 0.5% for an ambient temperature change of 20 degrees C. 68 degrees F.
- F. Alternators shall be furnished with 120V stator heater and controls.

## 2.7 CONTROLS

- A. The engine generator unit shall be furnished with a shock resistant, engine mounted microprocessor instrument panel in NEMA 1 enclosure, dead front, with removable panel.
- B. Standard data available shall include:
  - 1. Jacket water temperature
  - 2. Lube oil temperature
  - 3. Lube oil pressure
  - 4. Battery voltage
  - 5. RPM
  - 6. A.C. Voltmeter
  - 7. A.C. Ammeter
  - 8. Frequency meter
  - 9. Elapsed time meter calibrated in hours and tenths of hours
- C. Accessories shall include:
  - 1. Current transformers
  - 2. Fuses
  - 3. Generator voltage regulator

4. Voltage adjusting rheostat
  5. Fault indication lights one each for:
    - i. Low Oil Pressure
    - ii. High Water Temperature
    - iii. Overspeed
    - iv. Overcrank (Fail to Start).
  6. Prewarn indication lights one each for:
    - i. Low Oil Pressure
    - ii. High Water Temperature.
  7. 90 DB (a) Audible alarm to sound on any fault or prewarn and an alarm silencer.
  8. Mode selector switch – "AUTO", "OFF", "MANUAL" with audible alarm when switch is not in "AUTO" position.
  9. Control power fuse.
  10. Fixed overcrank timer - four-10 second cranks shall be provided. After four cranks, the unit shall stop and an alarm initiated.
  11. Auxiliary contacts which close when engine is in operation. Contacts shall be rated 10 amperes and shall be used to interlock combustion and ventilation air dampers.
  12. Common failure relay
  13. Dry contact kit with the minimum following contact signals for remote monitoring:
    - i. Engine Running
    - ii. Not in Auto
    - iii. Engine Trouble
    - iv. Battery Charger Alarm
    - v. Low Fuel Alarm
    - vi. Generator Emergency Stop
  14. Engine sensors for low water temperature near low oil pressure, near high water temperature.
  15. Refer to I-Drawings for additional requirements.
- D. In addition to the equipment included in the control panel described above, the unit shall include a power and control junction box mounted on the generator. This junction box shall include:
1. Three phase power conductors terminated with pressure type ring connectors.
  2. Neutral connection.

3. Terminal block with marked connection points for all external control connections and for jacket heaters, etc.
  4. Molded case line circuit breaker with interrupting rating of 42 KA amperes RMS.
- E. Automatic shutdown shall be provided for each of the following conditions:
1. High jacket water temperature
  2. Low jacket water pressure
  3. Low lubricating oil pressure
  4. Engine overspeed
  5. Unit fail to start.
- F. Auxiliary normal open dry contacts shall be provided for remote transmission of unit failure.
- G. Provide emergency stop pushbutton operator station for remote mounting in the electrical room.

## 2.8 SUBBASE

- A. The engine, generator and radiator shall be mounted on a structural steel base designed to maintain proper alignment. Vibration isolators shall be furnished of the size and type recommended by the supplier.

## 2.9 ENCLOSURE

- A. A sound-attenuated weather-protective housing shall be furnished. The housing shall enclose the complete unit and all related equipment (e.g. battery, battery charger, engine controls and control panel, etc). All components shall be wired and piped within the enclosure.
- B. The housing shall be constructed of 14 gauge rolled steel and shall include hinged locking access doors. Housing surfaces shall be prime painted with two coats of a rust resistant primer and finished with a dark green enamel paint.
- C. The housing shall be sound insulated, vandal proof, and padlocked. The resulting structure with engine-generator in full load operation shall not transmit more than 70 db at a distance of 23 feet from the generator in any direction. There shall be no Puretone. The generator set manufacturer shall choose the thickness of insulation to meet the aforementioned sound criteria.
- D. The housing shall be furnished with weather-protective fixed louvers, and weather-protective flanged door openings to insure weather-resistant construction.

- E. Stainless steel flexible exhaust sections shall be provided. Exhaust outlet shall be terminated with a “shanty cap” designed so to prevent entrance of rain into exhaust outlet. All handles, sheet metal screws, bolts, nuts, hinges, and other exterior hardware shall be stainless steel.

### PART 3 – EXECUTION

#### 3.1 MANUFACTURER'S SERVICES

- A. A minimum of one, eight-hour day shall be provided to supervise the installation and testing of the equipment furnished, to assist in start-up and train Owners maintenance personnel.
- B. A minimum of one, four hour day, not including travel time to and from the site, shall be used by a fully qualified field service engineer to make necessary adjustments and to provide operator training on the equipment furnished. This work shall occur after the equipment has been in operation and at the request of the owner, but not to exceed one year after the acceptance of the facility.
- C. Upon completion of the startup and owner acceptance off all engine generators provide an 8 hour on-site training owner training session.

#### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Operation and Maintenance Manuals
  - 1. Furnish Operation and Maintenance Manuals as specified in SECTION 01730 – Operation and Maintenance Data.
  - 2. Maintenance instructions shall be furnished for batteries, to include simple and clear procedures for addition of liquids, maintaining cleanliness, proper ventilation, proper electrical connections.
  - 3. Maintenance instruction shall be furnished for engines, including recommended lubricants, coolants, etc., recommended maintenance intervals, and recommended ventilation requirements.
  - 4. The Operating manual shall be a simple starting and stopping procedure, with reference to shop Drawings information for more complicated procedures.
- C. Complete and submit MassDEP standby generator installation compliance permit – refer to Appendix F.

END OF SECTION 16612

## SECTION 16650

### PHOTOVOLTAIC POWER SYSTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The Work of this Section includes furnishing all labor, materials, tools, and equipment necessary to provide a 25 kilowatt photovoltaic (PV) type solar power system as specified herein and/or as shown on the Contract Drawings complete with supports, instrumentation and controls, and required supporting systems.
- B. Provide roof mounted PV panels with an mounting support system, rapid shutdown modules, cables, cable support system, PV Inverter, service disconnect, and utility grade revenue meter.
- C. The PV solar power system package shall be complete in all respects and shall include all equipment, wiring systems and controls necessary for a fully operational system.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Manufacturer and model number of PV Panels, inverter, quick disconnects,
  - 2. Outline equipment drawings, equipment catalog cuts, interconnecting wiring and other documents required to completely describe the systems and equipment being furnished.
  - 3. Drawings, indicating PV panel layout, mounting details, size and location of anchor bolts, conduit locations, and estimated weights identified.
  - 4. Certificate of conformance to UL 1741/IEEE Standard 1547, Standard for Interconnecting Distributed Resources with Electric Power Systems, and UL Standard 1741, Standard for Inverters, Converters, Controllers and Interconnection System Equipment for Use with Distributed Energy Resources
  - 5. Signed and sealed analysis report by a professional engineer licensed in the State of Massachusetts for Engineer review and approval for the

roof/wind/snow/ice/seismic loads and detailed installation requirements in accordance with the current version of the International Building Code as determined by the Massachusetts State Building Code Review Board.

6. Solar Power System supplier shall provide proof of work experience for similar sized PV systems.
7. Operations and Maintenance Manuals, covering all equipment furnished, annotated to reference only the specific model numbers supplied. Include parts lists and parts prices current to the date of submittal; include information relevant to part supply and ordering. Submit prior to the startup and testing of the systems. Submit Construction details and dimensions and the following:
  - i. A complete set of all approved submittals including shop drawings and product literature.
  - ii. As-built drawings showing the final placement of all equipment, connections, and conduit placement.
  - iii. Trouble shooting guidelines.
  - iv. System maintenance schedule and procedures.
  - v. Contact information for technical assistance and parts ordering.

#### 1.4 QUALITY ASSURANCE

- A. PV System shall have the following safety and quality tests and certifications or equivalent:
  1. IEC 1215 Certification.
  2. IEEE 1262 Certification.
  3. UL listing with Class C or better fire rating.
  4. DC-AC Inverter shall meet UL1741 standards.
- B. PV panels shall be commercial grade.
- C. The PV panel mounting equipment, rapid shutdown modules, and cabling shall be listed compatible with the PV panels.
- D. The inverter manufacturer must have adequate experience in the industry and a product that is applicable for this project. The manufacturer must be able to provide an inverter as described in Part 2 and the manufacturer must have at least 5 years experience in the manufacture of battery-less, grid-interactive, inverters for commercial applications.
- E. Submit a detailed testing and startup plan for review by Engineer. The Contractor shall incorporate any modifications to the plan required by Engineer. Once the installation has been completed, and after all inspections have been performed and approved, the Contractor will test and start up the system. The Contractor will provide notice, in writing, to Engineer and to the local utility of his intent to start the system one week prior to the proposed start up date. After receiving written permission to start the

system from Engineer and the local utility, the Contractor will commission the system in keeping with all requirements of the commissioning plan, the inverter manufacturer startup procedures and the utility interconnection requirements. Once the system has been commissioned, the site will be left free of all tools, materials and debris.

F. The installation, testing, and startup shall be supervised by NABCEP certified installer. The shop drawing submittal shall provide the name, company, and contact information of the certified installer. Submittals that do not include the required information will be summarily rejected.

G. Test

1. Provide technicians, equipment and apparatus for performing field tests.
2. Measure output of each system over a 7 day period and provide summary report identifying energy output on a daily basis.
3. Compare test data to design data and identify any system deficiencies for resolution by solar power system manufacturer.
4. Measurement and record voltage of every source circuit.
5. Perform inverter startup tests as specified by the inverter manufacturer in the inverter operation manual.
6. Measure AC power and compare to predicted power based upon estimated irradiance level.
7. Perform loss of grid test and verify five-minute delay upon restoration of grid.
8. Verify data acquisition/display system is functioning properly comparing independent measurements to data acquisition display.
9. Correct any deficiencies uncovered by the testing prior to startup of the system.
10. Submit test reports for approval.

H. Warranty/Service

1. All materials and equipment shall be guarantee to be free from all defects due to faulty materials or workmanship for a period of five years from the date of acceptance of the system.
2. In addition the above, the additional written warranties shall be provided:
  - i. Photovoltaic System Panels - photovoltaic system panels shall have a minimum warranties as described herein.
  - ii. Inverters - Inverters shall be warranted to be free of defects for a period of not less than 10 years. The Contractor will list optional warranties with incremental cost.

- iii. Mounting Systems - Mounting System shall be warranted to be free of defects for a period of not less than five years. The Contractor will list optional warranties with incremental cost.
- iv. Roof - Installation shall not compromise existing building roof warranty. The Contractor shall provide a written statement from the roofing contractor or manufacturer stating that the roof warranty has not been compromised.
- v. Warranted System Rating - The Contractor will supply a written warranty stating the STC rating of the completed system.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.
- B. Protect material and equipment, in accordance with the manufacturers recommended storage procedures, before, during, and after installation. Stored items shall be protected from the weather and contamination. During installation, piping and similar openings shall be capped to keep out dirt and other foreign matter.

#### 1.6 DESIGN CRITERIA

- A. System equipment included PV panels shall not be manufactured in China or supplied by a Chinese company.
- B. The materials and equipment specified are intended to be standard materials and equipment of demonstrated successful performance, as manufactured by reputable concerns. Equipment shall be designed and constructed in accordance with the highest standards of the industry and shall be installed in accordance with the manufacturer's written recommendations and the Contract Documents. The Specifications call attention to certain features but do not purport to cover all details entering into the construction of the equipment.
- C. The photovoltaic system shall be manufactured/supplied by a company of good reputation that is regularly engaged in the manufacture and fabrication of photovoltaic systems. The photovoltaic system manufacturer shall have at least five years experience in manufacturing photovoltaic systems.
- D. The manufacturer/supplier of the photovoltaic system shall be completely responsible for the proper design of its system. All equipment shall perform as specified and the completed installation shall operate in accordance with the requirements of the Contract Documents.
- E. The Contractor shall assign full responsibility for the functional operation of all photovoltaic system components to a single source supplier. This supplier shall be responsible for all engineering necessary in order to select, furnish, inspect the installing contractor's equipment installation and connections, calibrate, and place into operation the photovoltaic system along with all other equipment and accessories as specified herein.

- F. The photovoltaic system shall be utility grid connected following the local electric utility's required design and installation standards for grid-tied customer-sited generation. Contractor shall prepare applications for interconnection with the local utility. An electrical permit will be filed for this project by the Contractor with a valid Massachusetts electrician license.
- G. The output of the photovoltaic inverter(s) will not interfere with or damage the function of building electrical distribution systems. All serviceable components must be accessible. The installation shall comply with all Federal, State, and local building codes.
- H. The system shall provide a data monitoring system with sensors and an interface integrated into the Owner's SCADA system
- I. Contractor shall provide all necessary materials for a complete photovoltaic system, as described within this specification, with a nominal combined capacity of 25 kW.
- J. The system shall be suitable for use at a Massachusetts public water supply site.

## PART 2 –PRODUCTS

### 2.1 GENERAL

- A. All mounting materials will be corrosion-proof aluminum or 304 stainless steel. All materials subject to exposure to the sun must be sunlight resistant material. All conductors will be copper.

### 2.2 INVERTER

- A. Inverter efficiency, based upon the California Energy Commission's (CEC) list of eligible inverters weighted efficiencies, shall be greater than or equal to 94 percent (refer to <http://www.gosolarcalifornia.ca.gov/equipment/inverter.php>).
- B. The inverter shall meet the current UL 1741/IEEE Standard 1547, NEC codes and the latest applicable ANSI and FCC standards and addenda.
- C. The single central inverter shall be sized for a 30 KW minimum complete photovoltaic system with a 277/480V, 3-phase, 4-wire output.
- D. Each inverter shall include:
  - 1. Automatic operation including start-up, shutdown, self-diagnosis, and fault detection.
  - 2. LCD for display of operating status.
  - 3. Ground fault protection.

- i. The AC interconnection shall comply with NEC by providing ground fault protection for the inverter AC output circuit. The protective circuit design will include a discrete ground fault relay that will trip the interconnecting shunt trip circuit breaker in the event of detection of excessive AC ground fault currents.
  - ii. Coordinate the photovoltaic system AC ground fault detection and protection device thresholds with the existing distribution system ground fault protection.
4. Ethernet Modbus communications capability for reporting internal system parameters.
5. NEMA 4X rated enclosure.
- E. Inverter shall be sized for a solar panel system with the following environmental conditions:
  1. High Temperature: 50 degrees C.
  2. Low Temperature: -40 degrees C.
- F. Configuration: 6 MPP Trackers with 2 strings with number of combiner modules as required to achieve minimum inverter DC input requirements. The inverter shall have an DC combiner input module for with number of DC input to at least match the configured system strings.
- G. The inverter shall be a grid-interactive, non battery-based model.
- H. The inverter shall be designed to accept the PV array output and shall be listed to UL1741 standards and shall be acceptable to the local utility.
- I. The inverter shall start, synchronize, operate, PV panels rapid shutdown, and disconnect automatically without the need for user action or intervention. The inverter shall communicate with PV panels of the DC power line via power line communications (PLC).
- J. The inverter shall be capable of operating in parallel with other grid interactive inverters.
- K. The inverter shall have integral AC and DC disconnect switches with through cover handles.
- L. The inverter shall have alarm output contacts and the following protective functions: AC over/under voltage, AC under/over frequency, over temperature, AC and DC over current, DC over voltage.
- M. Data Monitoring System
  1. The data monitoring system shall report the system parameters and fault conditions in a ethernet modbus communications to the SCADA system.
  2. The system parameters reported will include:

- i. DC voltage for each subarray of the array (subarray size TBD)
- ii. DC current for each subarray of the array (subarray size TBD)
- iii. DC power for each subarray of the array (subarray size TBD)
- iv. Total AC power
- v. Back of panel surface temperature
- vi. Panel ambient temperature
- vii. Plane of Array (POA) irradiance main incline
- viii. Percent of AC power generated vs purchased

## 2.3 PHOTOVOLTAIC PANELS

- A. 144 Mono PERC diamond half cells, encapsulated and bonded to glass in multiple layers on a highly resistant polymer back sheet.
- B. 3.2mm high transmission tempered glass with, anti-reflection coating.
- C. Anodized aluminum frame with pre-drilled mounting holes.
- D. Manufactured to ISO 9001 Standards and UL approved.
- E. Photovoltaic panels shall be approximately rated for 400 Watt STC, 294 Watt NOTC, 40.16 Volts, 9.96 Amps, 19.88% module efficiency STC.
- F. Panels shall be UL 61730 (Type 1 Fire Rated) and 50mm hailstone listed.
- G. Panel manufacture shall warrant that the photovoltaic modules will free from defects in materials and workmanship for 25 years from the date of delivery.
- H. Panel manufacturer shall warranty power production loss of not more than 17 percent within 25 years of purchase.
- I. Approximate Panel Dimensions: 40"x79".

## 2.4 RAPID SHUTDOWN MODULE

- A. A rapid shutdown module shall be provided for each PB module that shall directly connect to the PV panel output cables and mount directly to the PV module mounting system.
- B. UL 1741 certified and NEC compliant for module rapid shutdown with power line communications (PLC) with the inverter.
- C. Modules shall be compatible with the PV panels and inverter.
- D. Module shall have a NEMA Type 4X enclosure with integrated plug and play input/output DC cables.

## 2.5 AC KILOWATT-HOUR METER

- A. The system will include a revenue grade kilowatt-hour meter that will record the full AC output of the inverter.
- B. Meter socket will be NEMA 3R.

## 2.6 MOUNTING SYSTEM

- A. The roof mounted system must fit within the roof area of the water treatment facility building on the South incline. The ground mounted system must fit within the identified area allocated on the site.
- B. The mounting system shall include a horizontal, east-west, racking system spanning the standing seams.
- C. The roof array mounting mechanism shall not create an additional static roof loading in excess of 20 pounds per square foot over the mount contact area with the roof (wind loads excluded).
- D. The array mounting system shall support the panels in an orientation as shown on the drawings. This angle shall allow water to run off the panels (thereby rinsing away dust or other particulates) and to provide airflow around the panel for cooler, more efficient operation
- E. Panels shall be individually removable for roof access, maintenance or repair. Perimeter setbacks shall be as shown on the Contract Drawings, but shall not be less than three feet.
- F. The mounting system shall be designed to meet or exceed requirements of applicable state and local building codes, including wind speed, snow and seismic load requirements.
- G. The PV array mounting mechanism shall be thoroughly engineered and tested as a stable support for the PV panels in wind speeds up to 110 mph.
- H. The array mounting mechanism shall require minimal roof penetrations and shall be designed to be secured on to a supporting system on a metal roof.
- I. The mounting mechanism shall not significantly impede the flow of water across the underlying roof or ground surface.
- J. The PV array mounting system shall be arranged for the mounting of rapid shutdown modules and associated conduit and enclosures.
- K. Exposed PV panel wiring shall be kept to a minimum, shall be properly rated for sunlight resistance, shall be properly rated for the hot temperatures associated with the PV array (90 degrees C insulation) and shall be properly secured to avoid physical damage from wind, hail, or other environmental factors. Means of securing exposed

wiring must be sunlight resistant and able to withstand expected rooftop environmental factors over the life of the system.

- L. Junction boxes shall be secured to the supporting system.
- M. Framing system shall consist of anodized aluminum tubular frames manufactured to withstand wind speed of 100 mph and gusts to 120 mph
  - 1. Roof clamping system shall be dimensionally coordinated and compatible with roof supports shown on structural contract drawings.
  - 2. Hardware to be 304 stainless steel material.
  - 3. Clamping system to be metallurgically compatible with roof materials without the addition of a separate cathodic protection system.
- N. System shall be Unirac Solar Mount for the roof mounted PV system, or approved equal.

## 2.7 SYSTEM WIRING

- A. All wiring and conduits shall be in compliance with DIVISION 16 – ELECTRICAL
- B. All system wiring shall be of an NEC approved wiring method. All conductors shall have a temperature rating of 90 degrees C.
- C. All conductors shall be copper.
- D. Conductors shall be sized such that calculated DC voltage drop from the output of each source circuit to the inverter DC input shall not exceed 3 percent of the system maximum power voltage (Vmp). Contractor shall submit their calculations for review.
- E. All outdoor electrical enclosures shall be NEMA 4 and have watertight connections.
- F. Exposed DC cables shall be listed as sunlight resistant.
- G. All source circuit conductor array wiring must be securely fastened and supported and may not lay on the roof surface.
- H. Provide DC system cables, #10 AWG minimum XHHW.

## 2.8 PHOTOVOLTAIC SYSTEM GROUND

- A. The photovoltaic system ground shall be installed and sized in accordance with NEC and shall terminate on the ground bus in the Main Distribution Panelboard in the Water Treatment Facility.

## PART 3 – EXECUTION

### 3.1 VERIFICATION OF CONDITIONS

- A. Before the start of the Work of this Section, verify that the Project is ready for this Work.
- B. Verify that field measurements are as shown on approved Shop Drawings and/or manufacturer's instructions.
- C. Verify that the equipment or material is in conformance with the approved Shop Drawings and Specifications and resolve any deviations.

### 3.2 FABRICATION

- A. Fabricate each element and connection as indicated on the shop drawings approved by the Engineer.
- B. Only skilled workers trained, experienced, and regularly active in PV System installation shall be utilized for the work described in this section.
- C. Work shall be performed in accordance with the installation and operation instructions provided by equipment manufacturers and in accordance with this specification.
- D. All work shall be conducted in a professional manner with appropriate courtesy toward and coordination with other workers on site.
- E. All work shall be conducted in a safe manner in accordance with all appropriate safety guidelines and regulations.
- F. Work areas shall be kept clean and orderly. Any waste, excess material, or packaging.

### 3.3 FABRICATION

- A. Solar Power systems shall be erected complete with all components and accessories specified and in strict accordance with the manufacturer's printed instructions and approved shop drawings. Systems shall be installed as indicated on the Contract Drawings.
- B. Align framing systems for solar panels with structural members.
- C. Provide bolts and anchors with templates for correct placement to supporting materials.
- D. Hold steelwork securely in place with temporary bracing and stays to resist all vertical and lateral loads, until framing is permanently fastened.
- E. Inspect and torque test field-assembled bolted construction in conformance with manufacturer's published data.
- F. Make all cable connections and ensure all exterior enclosures, are weathertight.
- G. Report errors in shop fabrication or deformation resulting from handling or transportation immediately to Engineer. Replace and remove from job site incorrect fabricated or deformed material at no additional cost to the Owner.

- H. Do not enlarge holes or damage roof supports during assembly.
- I. Enlarge holes to admit bolts for connections only if approved in writing by Engineer. Make enlargements only by drilling. Refinish enlarged holes with paint to match the shop coat. Use specified galvanize touch-up for galvanized members.
- J. Photo Voltaic System
  - 1. Attach PV supports to roof structure or ground support framing.
  - 2. Attach PV panels to the mounting/support structure.
  - 3. Install rapid shutdown panels, cable supports, and cables at the rooftop location.
  - 4. Provide wiring within each PV array and wiring from each PV array to system elements in raceways provided under Division 16. All DC wiring and components shall be labeled for polarity and circuit. All AC wiring and components shall be labeled for phase.
  - 5. Install disconnect devices, meter, and DC-AC inverter
  - 6. Label all equipment to meet NEC and utility requirements. A laminated B size, one-line drawing showing the photovoltaic system major components and interconnection to the facility AC distribution system will be posted at the inverter.
  - 7. Label to identify all system components.
- K. Installation Requirements
  - 1. All over-current protection devices shall have trip ratings no greater than the de-rated amperage of the conductor it protects.
  - 2. All mounting equipment shall be installed to the manufacturer's specifications. All outdoor materials shall be corrosion resistant material. No wood or ferrous metal may be used.
  - 3. All wiring shall be accessible to service personnel.
    - i. All cables, conduit, exposed conductors, and electrical boxes should be secured and supported according to NEC requirements.
  - 4. For any components installed on the roof, the system shall maintain roof and structural integrity. The loading impact of the array, wind, snow, etc. shall be determined prior to the installation. The successful contractor will enter into an agreement with the roof manufacturer to provide QA/QC during installation to ensure that the roof warranty is in affect. Sleeper conduit supports and pitch pockets will be approved by roofing contractor. The Contractor shall submit details of proposed work for review and approval as part of the shop drawing.

5. The photovoltaic system shall have no adverse impact on any of the building electrical systems. All conduits and equipment must be protected with bollards or comparable means where subject to mechanical damage.

#### L. Installation Standards

1. System installation shall conform to all manufacturer's installation manuals and approved project drawings and specifications.
2. All applicable local and NEC codes shall be observed.
3. Contractor shall comply with all specifications within this document. Contractor will ensure subcontractors (if used) shall comply with manufacturer's installation guidelines and this specification.

#### M. Point of Interconnection

1. Interconnect to the load side of the main electrical panel at the spare dedicated circuit breaker. The trip setting of the interconnection shall be adjusted to not less than the overcurrent rating required for the inverter(s).

#### N. Inverter Interoperability

1. Provide confirmation from the inverter manufacturer that interconnection to this local electrical distribution system will represent no hazard to the safe and reliable operation of the proposed inverter and that it will in no way affect the inverter warranty
2. The project includes the installation of a new on-site generator. On occasion, the generator may be run to electrically "island" the facility.

### 3.4 MANUFACTURER'S SERVICES

#### A. Provide services of Service Technician, specifically trained on type of equipment specified. Person-day requirements are listed exclusive of travel time:

1. Assist in location of devices, methods of mounting, field erection, inspection prior to energizing the equipment, etc.
  - i. 1 person-day
2. Start-up and testing.
  - i. 3 person-days
3. Owner Training
  - i. 1 person-day
4. Person-day is defined as one 8-hour day, excluding travel time.

### 3.5 SPARE PARTS

- A. One set of spare parts shall be provided for equipment as noted herein. Spare parts shall be effectively protected from moisture and corrosion with appropriate wrappings or coatings or a combination thereof. Spare parts shall be furnished in sturdy labeled boxes.
  - 1. One set of special tools required for normal operations and maintenance.
  - 2. Spare PV panels equal to 1/2 percent of the total STC capacity of the array.
- B. Spare parts shall be identical to and interchangeable with parts installed.

### 3.6 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Operation and Maintenance Manuals
  - 1. Furnish Operation and Maintenance Manuals as specified in SECTION 01730 – Operation and Maintenance Data.

END OF SECTION 16650

## SECTION 16720

### SECURITY ALARM SYTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this subsection includes the furnishing and installing of a complete security alarm system as specified herein and as shown on the Drawings. The system shall be electrically supervised, connected, tested and left in first class operating condition.
- B. The system shall consist of, but shall not be limited to a security alarm control panel, keypads, magnetic door switches, timed exit/entry delay control, conduit, fittings, outlet boxes and wire, operating instructions and maintenance instructions.
- C. Provide all required coordination with door installations for proper installation of alarm devices and wiring.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. Complete system wiring diagrams and elementary or control schematic.
  - 2. Data sheets and outline drawings showing details for mounting all control devices and panel.
  - 3. Battery load calculations.
  - 4. Standard preprinted sheets or drawings simply marked to indicate applicability to this contract will not be acceptable.
  - 5. Operating instructions and maintenance procedures. Operating instructions shall be furnished separate from manufacturers standard catalog literature and shall include recommended customer troubleshooting procedures. Maintenance procedures shall be furnished separate from manufacturer's standard catalog literature and shall include battery maintenance, lamp and fuse replacement, detector periodic checking and reset procedures, and other applicable procedures.

## 1.4 QUALITY ASSURANCE

### A. Testing

1. Manufacturer's Field Services: Engage a factory-authorized service representative to inspect field-assembled components and perform system pretesting, testing, adjustment, and programming.
2. Before the installation is considered complete and acceptable, a demonstration test on the entire system shall be performed as follows:
  - i. Test shall ensure that the requisite degree of intrusion detection is provided.
  - ii. Test each sensor and component individually.
3. The system test shall be accomplished in linear fashion, end-to-end, and shall verify that each simulated intrusion performed within each detection zone produces an appropriate alarm or signal, and that alarm is correctly annunciated at the keypad and remotely.

### B. WARRANTY

1. The manufacturer shall guarantee all system equipment for a period of three (3) years from the date of final acceptance.
2. The Electrical FSB shall guarantee all raceways and wiring to be free from inherent mechanical or electrical defects for one (1) year from the date of final acceptance of the system.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## 1.6 DESIGN CRITERIA

- A. The security system shall be the standard product, as modified by these Specifications of a manufacturer regularly engaged in the production of this type equipment. In addition, the manufacturer shall maintain a permanent service organization and a supply of spare parts as necessary to provide adequate service to this system within 24 hours from receipt of a request for service.
- B. All equipment shall be listed by Underwriters Laboratories.
- C. The equipment manufacturer shall have a local branch office within 75 miles staffed with trained, full time employees who are capable of performing testing, inspecting, repair and maintenance services for the life of the manual alarm system.
- D. All components of the system shall have been tested for compatibility with each other to ensure the system performs all intended functions.

E. The system shall be have the following alarm zones

1. Lower Level East Door Intrusion
2. Upper Level West Door Intrusion
3. Upper Level North Door Intrusion
4. Spare
5. Spare
6. Spare
7. Spare
8. Spare

F. System Operation

1. Actuation of the door switch while the system is armed shall:
  - i. Actuate the respective zone alarm lamp at the security alarm keypads.
  - ii. Actuate discrete remote dry contact alarm to the SCADA system.
2. The security alarm keypads panel shall allow a timed exit/entry control to access the building without tripping the alarm. Authorized personnel entering the building will have up to five minutes to de-activate the alarm system prior to sending an alarm output.
3. Opens, ground, or tampering, occurring on the zone monitor circuit during bypass or secure mode of operation shall cause a trouble signal. To clear a trouble signal transmission, the trouble must be corrected and the system will automatically return to its normal state of operation. To restore the device actuating the alarm, the alarm must be secured to its normal position and the system reset switch operated. A trouble signal on an individual zone monitor circuit shall not interfere with the automatic transmission of an alarm signal on another zone monitor circuit occurring during the same period.

G. All system functions, alarms and annunciations shall be monitored and controlled at the keypads.

H. The system shall have the capacity to collect date/time entry data in non-volatile memory and display the date/time entry when requested by an authorized user.

I. The system shall have the capacity to collect, communicate, and display a minimum of 8 programmable sensor zone alarms and to enable control of one or more response devices in each of the sensor zones.

- J. A single alarm shall be annunciated at keypads within 2 seconds after sensor transducer or other detection device activation.
- K. Provide the capability to detect when a critical component of the system experiences temporary or permanent loss of power and to declare an alarm at the keypads.
- L. Intrusion alarms shall not be generated by power switching; however, an indication of power switching and on-line source shall be provided at the security alarm keypad. Upon restoration of normal power, the system shall automatically switch back to the primary source. Low voltage condition of an on-line battery and battery charger circuit failure shall be detected and reported as a fault condition.
- M. System Wiring
  - 1. The system shall be wired, connected, and left in first class operating condition. Wiring shall be provided and installed in accordance with the manufacturers Drawings. The Contract Drawings indicate the devices required for each building, the types of devices to be installed, and the general method for connecting the system devices together. The actual number of wires to be installed in each raceway and the size of each raceway shall be in accordance with the manufacturer's Drawings.

## PART 2 –PRODUCTS

### 2.1 SECURITY ALARM CONTROL PANEL

- A. Provide micro-processor based modular components to make up a complete control system. The panel shall have the following features:
  - 1. Alarm output relays.
  - 2. Zone monitoring.
  - 3. Earth detection.
  - 4. Sealed lead acid battery standby power shall be supplied. It shall be under lock and key within this supervised cabinet to prevent deliberate tampering.
  - 5. Solid state battery charger.
  - 6. Alarm resound.
  - 7. Total system supervision by a micro-processor which will supervise all wiring regardless whether or not the area of protection is bypassed or not
  - 8. Quantity three normally open dry contacts which close on alarm conditions.
  - 9. Surge protector

- B. Electrical power shall be obtained by the normal electrical distribution system. Power shall be continuously monitored and, if interrupted, automatic switching from primary to emergency backup source shall be accomplished without interruption or degradation of critical system function.
- C. Furnish 120 volt AC service, transformed through a two-winding isolation transformer and rectified to low-voltage DC for system operation. Obtain primary power at the 120V breaker as indicated in the Contract Documents.
- D. Provide lockable device at circuit breaker and label the circuit breaker in that panelboard: "Alarm System Do Not Turn Off."
- E. Provide backup power to the primary power by dedicated batteries in the Control Panel. Batteries shall be capable of operation in any position and shall be protected against venting caustic chemicals or fumes within an equipment cabinet. Batteries shall also be capable of continuous operation for up to 4 hours without recharge or replacement. If the sensors power requirements exceed the allowable UL rated capacity of the control communicator battery, provide the number of separate power supplies required to power the sensors. Provide each power supply with its own rechargeable battery and charger.
- F. Provide system components to facilitate modular subassembly and part replacement. Electronic components of the system shall be of the solid-state type, mounted on printed circuit boards conforming to UL 796. Circuitry shall not be so densely placed as to impede maintenance. Power-dissipating components shall incorporate safety margins of not less than 25 percent with respect to dissipation ratings, maximum voltages, and current-carrying capacity. Light duty relays and similar switching devices shall be solid-state or hermetically sealed electromechanical type.
- G. Provide only components in current manufacturing production. Components shall be manufactured to meet requirements specified herein and shall be free from characteristics and defects which affect appearance or serviceability or which render equipment unsuitable for the intended purpose. Provide components designed for continuous operation at specified conditions.
- H. Intrusion detection, communication, and power circuits shall be protected against lightning and voltage transients. Surge suppression device shall conform to UL 1449, rated single pulse transient energy by metal oxide varistor (MOV). The protective device shall be automatic and resettable and shall be active at all times. Fuses shall not be permitted as protection devices.
- I. Provide control devices to ensure ease of operation of specified characteristics. Where applicable, clockwise rotation of controls shall result in an increasing function. Controls, switches, visual signals, and indicating devices, input and output connectors, terminals, and test points shall be clearly marked or labeled on hardware to permit quick identification, intended use, and location. Terminal markings and labels shall be of a permanent and legible type and located to be visible when the associated system wiring is in place. Identification markings shall be associated with each adjustment device or item requiring periodic maintenance. Safety warning or cautions shall be

marked in conspicuous red letters. Controls not required for operation of the system shall be inaccessible to the system operator.

- J. Cabinets, control communicators, wiring gutters, and other component housings, collectively referred to as enclosures, shall be formed and assembled to be sturdy and rigid. Metal thickness shall not be less than those in Tables 8.1, 8.2, and 8.3 of UL 1610 for alarm components, and NEMA ICS 2 and NEMA ICS 6 for other enclosures.
- K. Doors and covers shall be flanged. Where doors are mounted on hinges with exposed pins, hinges shall be of the tight-pin type, or ends of hinge pins shall be tack welded to prevent ready removal. Provide doors having a latch edge length of less than 24 inches with a single lock. Covers of junction boxes provided to facilitate initial installation of the system shall be held in place by tack welding, brazing, or one-way screws.
- L. Ventilation openings in enclosures and cabinets shall conform to the requirements of UL 1610. Sheet metal enclosures shall be designed for surface or recessed wall mounting with top hole slotted.
- M. Locks and key-lock-operated switches required to be installed on component enclosures shall be UL listed, round-key type with three dual, one mushroom, and three plain pin tumblers, or shall have a pick resistance equal to a lock having a combination of five cylinder pin and five-point three-position side bar in the same lock. Keys shall be stamped "DO NOT DUP". Key-lock-operated switches shall be keyed differently.

## 2.2 KEYPADS

- A. Provide control surface mounted keypad devices to ensure ease of operation of specified characteristics. Controls, buttons, visual signals, and indicating devices shall be clearly marked or labeled on hardware to permit quick identification, intended use, and location.
- B. Entry/Exit delay. Timer shall be adjustable from 0 to 5 minutes.
- C. Annunciators shall be liquid crystal displays (LCDs). Annunciators shall be so connected in the circuit that failure of the annunciator, socket, or protective circuitry shall not result in an improper or indeterminate signal. LCDs shall be compatible with standby power supplies.
- D. Common trouble signal, trouble silencing switch, power on lamp, reset switch, alarm acknowledge switch and common zone test.
- E. An alarm shall be annunciated to clearly identify any component experiencing power loss.
- F. Provide NEMA 4X clear plastic door hinged enclosure over keypads.

## 2.3 MAGNETIC DOOR SWITCHES

- A. The switch mechanism shall have a minimum gap of 3/8-inch and a maximum gap of 1 1/4 inches without internal adjustment.
- B. The magnetic and switch parts of the devices shall be fully encapsulated in a weatherproof enclosure, the switch portion shall have a factory 24" minimum armored cord containing the switch wiring.
- C. The magnetic and switch parts of the devices be secured using tamper resistant to the door and from with stainless steel screws.
- D. Each end of the armored cord shall terminate in a junction box above the door for hinged door and next to the door for overhead doors. Armored cord ends shall be mechanically secured to junction boxes by clamps or bushings. The armored cord shall experience no mechanical strain as the door is removed from fully open to closed.

### PART 3 – EXECUTION

#### 3.1 INSTALLATION

- A. Installation shall be supervised and tested by the system supplier. The work shall be performed by skilled technicians under the direction of experienced engineers, all of whom are properly trained and qualified.
- B. All wiring for the system shall be in accordance with Articles 760, 725, and 800 of the National Electrical Code and local electrical codes.
- C. Coordinate the installation of the door switches and wiring with doors. The door switches shall be located at the top of jam side of the door near for hinged doors and located at the bottom of overhead doors.
- D. Ground system components and conductor and cable shields to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.
- E. Device wiring shall be No. 14AWG Type THWN copper type. All wiring shall be color coded. All wiring shall be tagged at each junction point. Proper connectors shall be installed at terminations to accept the No. 14 AWG wiring.
- F. No conduit smaller than 3/4 inch shall be installed.

#### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Training
  - 1. Provide the services of the manufacturer's representative to explain programming and operation of system and to train Owner's maintenance personnel on procedures and schedules for maintaining, programming, operating, adjusting,

troubleshooting, and servicing system. Provide a minimum of four hours' training in operation and maintenance.

END OF SECTION 16770

## SECTION 16721

### FIRE ALARM SYTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this subsection includes the furnishing and installing of a complete addressable fire alarm system as specified herein and as shown on the Drawings. The system shall be electrically supervised, connected, tested and left in first class operating condition.
- B. The system shall consist of, but shall not be limited to a fire alarm control panel, fire and smoke detection devices, manual pull stations, audible/visual alarms, alarm annunciator, Master Box, conduit, fittings, outlet boxes, wire, operating instructions and maintenance instructions.
- C. Fire Alarm Control Panels, all initiating devices and indicating devices shall be provided by one manufacturer, no exceptions.
- D. The system shall interface with the chemical manual alarm system installed under DIVISION 16 – ELECTRICAL, SECTION 16722, MANAUL ALARM SYSTEM and Contract Drawings
- E. The system shall interface with duct detectors installed under DIVISION 15 - MECHANICAL, SECTION 15500, HEATING, VENTILATION AND AIR CONDITIONING and Contract Drawings.
- F. The system shall interface with sprinkler system flow and tamper switches installed under DIVISION 15 – FIRE PROTECTION, SECTION 15300, FIRE PROTECTION and Contract Drawings.
- G. The General Contractor and Electrical FSB shall meet with the local fire department prior to submitting any shop Drawings for this project.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:

1. The system riser diagram shall indicate every alarm control panel, terminal panel, actuating device, annunciator panel and the required interconnecting wiring with wire type, quantity and raceways sizes.
2. Description of system operation, of each panel and device.
3. Original copies of catalog cuts of all devices, modules, batteries, battery chargers, etc. Copies of internet based data shall not be acceptable.
4. Battery load calculations for each panel.
5. Operating instructions and maintenance procedures. Operating instructions shall be furnished separate from manufacturers standard catalog literature and shall include recommended customer troubleshooting procedures. Maintenance procedures shall be furnished separate from manufacturer's standard catalog literature and shall include battery maintenance, lamp and fuse replacement, detector periodic checking and reset procedures, and other applicable procedures.

#### 1.4 QUALITY ASSURANCE

##### A. Testing

1. The system shall be fully tested by a UL certified testing company, in accordance with UL guidelines and NFPA standards. Each and every device shall be field tested.
2. A copy of the final test report and UL certificate shall be submitted indicating proper functioning of the system and conformance to the specifications. The test shall be performed by UL certified and factory-trained qualified technicians. Each and every device shall be tested, and standalone operation of remote panels shall be verified. Final testing and UL certification shall be performed by the same company that will hold and execute the Test and Inspection contract.

##### B. WARRANTY

1. The manufacturer shall guarantee all system equipment for a period of three (3) years from the date of final acceptance.
2. The Electrical FSB shall guarantee all raceways and wiring to be free from inherent mechanical or electrical defects for one (1) year from the date of final acceptance of the system.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## 1.6 DESIGN CRITERIA

- A. The equipment and completed installation shall be in compliance with local and national codes, authorities having jurisdiction, the local Fire Department, and in accordance with applicable sections of the latest edition of NFPA 72 for Fire Alarm Systems.
- B. All equipment shall be listed by National Fire Protection Association, Underwriters Laboratories and/or the Factory Mutual System.
- C. The equipment manufacturer shall have a local branch office within 75 miles staffed with trained, full time employees who are capable of performing testing, inspecting, repair and maintenance services for the life of the fire alarm system.
- D. All components of the system shall have been tested for compatibility with each other to ensure the system performs all intended functions.
- E. System Operation
  - 1. The operation of a manual station or activation of any automatic alarm initiating device (system smoke, heat, sprinkler flow switch) shall automatically:
    - i. Initiate the transmission of the alarm via the cellular DACT.
    - ii. Sound a code 3 temporal evacuation signal over all audio circuits.
    - iii. Flash all visual signals throughout the building in a synchronized manner.
    - iv. Flash an alarm LED and sound an audible signal at the Fire Alarm Control Panel (FACP). Upon Acknowledgment, the alarm LED shall light steadily and the audible shall silence. Subsequent alarms shall re-initiate this sequence.
    - v. Visually indicate the alarm initiating device type and location via the LCD display located at the FACP.
    - vi. Automatically shut down or control HVAC equipment. Manual override controls and programmable relay interface shall serve as an interface to the HVAC equipment.
    - vii. Activate the exterior weatherproof beacon.
    - viii. Close a dry contact for interconnection to the SCADA system.
  - 2. The operation of a carbon monoxide detector shall automatically:
    - i. Sound a code 4 temporal evacuation signal over the detector's sounder base.
    - ii. Illuminate the red alarm LED on the detector.
    - iii. Flash an alarm LED and sound an audible signal at the FACP. Upon Acknowledgment, the alarm LED shall light steadily and the audible shall silence. Subsequent alarms shall re-initiate this sequence.
    - iv. Visually indicate the alarm initiating device type and location via the LCD display located at the FACP.
  - 3. The activation of a system trouble condition (system battery, broken circuit, ground fault, device failure, sprinkler tamper switches, communication failure, ect)

- i. Initiate the transmission of the trouble condition to an approved private monitoring station via a Digital Alarm Communicator/Transmitter (DACT).
- ii. Indicate the trouble condition and sound an audible signal at the FACP

F. System Wiring

1. The system shall be wired, connected, and left in first class operating condition. Wiring shall be provided and installed in accordance with the manufacturers Drawings. The Contract Drawings indicate the devices required for each building, the types of devices to be installed, and the general method for connecting the system devices together. The actual number of wires to be installed in each raceway and the size of each raceway shall be in accordance with the manufacturer's Drawings.
2. Initiating circuits shall be addressable type.
3. Addressable loop wiring shall support all devices shown and allow for a minimum of 25% spare capacity and be wired in a Class X style.
4. As a minimum, power supplies and notification appliance circuits shall operate all devices shown plus 25% spare capacity, and be wired in a Class A style.

G. System shall be addressable microprocessor based and shall provide the following features:

1. Individual identity of each addressable device for the following conditions: alarm; trouble; open; short; and appliances missing/failed remote detector - sensitivity adjustment from the panel for smoke detectors.
2. Individual identity of each addressable device for the following conditions: alarm; trouble; open; short; and appliances missing/failed remote detector - sensitivity adjustment from the panel for smoke detectors.
3. Capability of each addressable device being individually disabled or enabled from the panel.

H. Devices located within the chemical areas shall be weatherproof type of corrosion resistant material.

## PART 2 –PRODUCTS

### 2.1 FIRE ALARM CONTROL PANEL

- A. Provide and install a Fire Alarm Control Panel (FACP). The system shall support up to 390 analog/addressable devices, expandable to 1950 points in a true peer-to-peer network (multi-panel) configuration. The FACP shall provide the following functions:
1. Monitor all initiating devices, report to each network node, annunciate the alarmed device and its' location, capture elevators, conduct smoke control functions, and

initiate the audio/visual evacuation signaling and control sequences as described herein.

2. Conduct municipal notification as described herein.
  3. Initiating devices shall respond with their condition. Control relays shall be individually addressable by the system to respond automatically in the event of an alarm of related sensors. Manual override of control relays shall be individually addressable by the operator.
- B. Control Configuration: All fire alarm control portions of the system shall be housed in red locking, semi-flush mounted enclosures. All panel initiating and control status indicators shall be visible through a clear Lexan window. Access to the control panel shall be by keys issued to the Fire Department and authorized personnel. Each panel shall incorporate an operator interface, CPU, addressable loop interface cards, audio control/microphone, amplifiers, power supply and batteries to perform the system operation as described herein.
- C. Primary Operator Control: The FACP shall provide an operator interface module consisting of a 180 character backlit LCD display to display all system alarm, trouble and supervisory conditions, and shall provide common control switches for system status scrolling, alarm acknowledge, trouble acknowledge, reset, and system drill. The unit shall have LED indicators for Normal Power Status, Alarm, Supervisory, Trouble and Test/Program.
- D. Addressable Loop Interface: Provide an addressable loop interface card for each addressable signaling line circuit. Each circuit shall support digital communications with up to 196 addressable field devices, with loop distances in excess of 6,000 ft. The addressable loop interface shall support the following features and functions:
1. Provide full digital communications with analog field devices.
  2. An integral alarm relay which will support alarm operation in the event of a failure of addressable loop data communications.
  3. The interface card shall support the retrieval of the following information from each individual analog system device:
    - i. Device serial number
    - ii. Device address
    - iii. Device type and personality code
    - iv. Date of manufacture
    - v. Hours in use
    - vi. Number of alarms and troubles
    - vii. Time and date of last alarm
    - viii. Amount of environmental compensation left/used
    - ix. Last maintenance date
    - x. Current detector sensitivity values
    - xi. Diagnostic information (trouble codes)

- E. Auxiliary Control / Annunciation: Provide auxiliary annunciator switch and LED modules for simple LED annunciation, zone disconnect, HVAC override, or other related monitoring and control functions. These are intended for use by the Fire Department during an event, or by authorized personnel during testing periods. Keypad entered commands for these functions shall not be an acceptable substitute. Alarm LEDs and zone disconnect switches shall be provided by type of device on a per floor/zone basis. Provide a minimum of 64 discreet programmable alarm LEDs, and 32 discreet programmable 2-position control switches with corresponding LED indicators.
- F. System Power Supplies: Integral system 120VAC input power supplies shall provide 12amps of 24VDC operating and emergency power to each panel. Each supply shall contain brownout, low battery detection, system ground fault, and LED indicators for loss of AC or CPU failure.

## 2.2 INTELLIGENT SYSTEM DEVICES

- A. Provide intelligent analog devices where shown and required. Each device shall retain operating characteristics in non-volatile memory and conduct algorithms to distinguish real fire conditions from unwanted nuisance alarms. All analog devices shall provide dual LED indicators, a green LED shall flash to denote active communication, and a red LED shall flash to denote an alarm condition. Devices shall be interchangeable with twist-lock bases which may include a supervised remote LED output, fault isolation circuitry, or an auxiliary relay contact. In the event of an addressable loop communications failure, devices shall remain capable of initiating an alarm sequence.
- B. Multi-sensing Smoke Detector: Provide multi sensing analog smoke detectors where shown on Contract Drawings and required. Each detector shall employ photoelectric, ionization and thermal sensing principles.
- C. Heat Detectors: Provide fixed temperature 135 degrees F vapor-tight industrial grade units connected to monitor modules installed in all NEMA 4 and NEMA 4X areas.
- D. Analog Duct Smoke Detector: Provide analog photoelectric duct smoke detectors mounted in air ducts where shown on Contract Drawings and required. Each detector shall be supplied with duct mounting plate, remote test station/indicator and sampling tubes sized according to duct width. Provide the required auxiliary relay outputs or addressable relay control modules with each detector in order to accomplish the required HVAC control and override functions.
- E. Carbon Monoxide Detector: Provide analog carbon monoxide detectors shall employ an electrochemical sensing cell. The detector shall have a red LED alarm notification and audio sounder base.
- F. Intelligent Manual Pull Stations: Provide intelligent addressable manual stations where shown on Contract Drawings and required. The station shall be double action type with screw terminals, toggle switch, and integral addressable electronics. The station shall be constructed of red Lexan with white raised letters and a key reset switch. The station shall be keyed alike to the FACP.

- G. Monitor Module: Provide addressable input monitor modules to monitor related systems or integrate conventional initiating devices onto the addressable loop.
- H. Control Module: Provide addressable output control modules to supervise and control conventional devices (indicating circuits, AHUs, SCADA interface. etc.) over the addressable loop. Control modules shall provide a supervised output rated for 1, 2 or 5 amps @ 24VDC and 120VAC, as required by the conventional device.
- I. Isolation Modules: Provide Isolator Modules to protect circuit integrity in the event of a wiring fault. Provide a minimum of one module per floor/zone, or one for every 25 devices; whichever is greater.

### 2.3 PRIMARY NOTIFICATION APPLIANCES

- A. Primary Notification Appliances: Flush mounted combination Audio/Visual Horn/Strobe type signaling appliances. Stand alone devices may be used to augment combination units when necessary. Specific audible and visual characteristics shall be as follows:
  - 1. Visual Signals shall be self-synchronizing xenon strobes in compliance with NFPA 72. Strobes shall have an effective intensity rating of 15 candela in corridors and other areas up to 20' x 20', 30 candela in areas up to 30' x 30' and 110 candela in areas up to 50' x 50'.
  - 2. Audible Signals shall be horns in compliance with NFPA 72, 24 Volt dc polarized type with a minimum sound output shall be 90 db at 10 feet
- B. Exterior Strobe: Provide a flashing weatherproof strobe with a minimum 150,000 candlepower output were shown. The strobe shall be properly installed on a weatherproof backbox.

### 2.4 SYSTEM ACCESSORIES

- A. Monitoring Connection: Provide a Digital Alarm Communicator/Transmitter (DACT) with cellular communications to an approved Central watch station. The DACT shall be housed in a wall mounted red enclosure with a 120VAC input power supply, 24 hour back up power, battery charger, and a 3dBA cellular antenna.
- B. Sprinkler System Devices: The Electrical FSB shall coordinate the following to ensure that the required installation and wiring of all waterflow and tamper switches is accomplished in a manner that will result in a complete operable and tested sprinkler system. Each device shall be monitored as a separate and distinct point.
  - 1. Waterflow will activate the alarm sequence.
  - 2. Tamper switch will activate a supervisory trouble.
- C. Terminal Cabinets: Provide fire alarm terminal cabinets where necessary. The cabinets, which shall have a removable hinged cover with key lock and red finish are intended to house analog/addressable modules and facilitate field wiring junctions.

- D. Auxiliary Power Supplies: Where the power requirements exceed that which is supplied by the FACP, auxiliary power supplies may be used. Each auxiliary power supply shall be supervised for loss of AC power and Battery Fail, and each notification circuit served shall be individually supervised.
- E. Key Repository: Provide an approved key repository where shown and required in accordance with local requirements. Key repository as required by the Sharon Fire Department for the main entrance door shall be a Knox Box 3200 hinged box.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Installation shall be supervised and tested by the system supplier. The work shall be performed by skilled technicians under the direction of experienced engineers, all of whom are properly trained and qualified.
- B. All wiring for the system shall be in accordance with Articles 760, 725, and 800 of the National Electrical Code and local electrical codes.
- C. Wiring shall be No. 14AWG Type XHHW copper type. All wiring shall be color coded. All wiring shall be tagged at each junction point. Proper connectors shall be installed at terminations to accept the No. 14 AWG wiring.
- D. Provide complete wiring and conduit between all equipment. All devices shall be mounted upon and splices made in UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted. All wiring shall be installed in raceway as specified in SECTION 16130, RACEWAYS AND FITTINGS
- E. No conduit smaller than 3/4 inch shall be installed.
- F. All fire alarm raceway system including junction boxes shall be factory painted red conduit and box covers.
- G. Conduit sizes and wire quantities shall be suitable for the equipment furnished. The Electrical FSB shall review the proper installation of each type of device with the equipment supplier.
- H. Fire Alarm control systems and equipment shall be connected to separate dedicated branch circuits, sized as required for proper service. Circuits shall be labeled 'FIRE ALARM'.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Training

1. Provide the services of the manufacturer's representative for a period of 4 hours, during normal business hours, to instruct the owner's designated personnel and fire department response teams on the operation of the system.

### 3.3 SPARE PARTS

- A. Provide one detector, pull station and one audio/visual device of each type to the Owner at the conclusion of all work.

### 3.4 MANUAL ALARM TEST AND INSPECTION CONTRACT

- A. The Electrical FSB shall include as part of their base bid the cost of a one-year test and inspection contract. This contract shall provide for quarterly tests according to UL, NFPA 72 and local requirements. Upon its expiration, the contract shall be renewable by the town.

END OF SECTION 16721

## SECTION 16722

### MANUAL ALARM SYTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The work of this subsection includes the furnishing and installing of a complete manual alarm system for the chemical rooms utilizing a 4-zone conventional fire alarm system as specified herein and as shown on the Drawings. The system shall be electrically supervised, connected, tested and left in first class operating condition.
- B. The system shall consist of, but shall not be limited to a chemical alarm control panel, manual pull stations, audible/visual alarms, alarm annunciator, conduit, fittings, outlet boxes, wire, operating instructions and maintenance instructions.
- C. Chemical Alarm Control Panel and all initiating devices and indicating devices shall be provided by one manufacturer, no exceptions.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. The system riser diagram shall indicate every alarm control panel, terminal panel, actuating device, annunciator panel and the required interconnecting wiring with wire type, quantity and raceways sizes.
  - 2. Description of system operation, of each panel and device.
  - 3. Original copies of catalog cuts of all devices, modules, batteries, battery chargers, etc. Copies of internet based data shall not be acceptable.
  - 4. Battery load calculations for each panel.
  - 5. Operating instructions and maintenance procedures. Operating instructions shall be furnished separate from manufacturers standard catalog literature and shall include recommended customer troubleshooting procedures. Maintenance procedures shall be furnished separate from manufacturer's standard catalog

literature and shall include battery maintenance, lamp and fuse replacement, detector periodic checking and reset procedures, and other applicable procedures.

#### 1.4 QUALITY ASSURANCE

##### A. Testing

1. The system shall be fully tested by a UL certified testing company, in accordance with UL guidelines and NFPA standards. Each and every device shall be tested.
2. A copy of the final test report and UL certificate shall be submitted indicating proper functioning of the system and conformance to the specifications. The test shall be performed by UL certified and factory-trained qualified technicians. Each and every device shall be tested, and standalone operation of remote panels shall be verified. Final testing and UL certification shall be performed by the same company that will hold and execute the Test and Inspection contract.

##### B. WARRANTY

1. The manufacturer shall guarantee all system equipment for a period of three (3) years from the date of final acceptance.
2. The Electrical FSB shall guarantee all raceways and wiring to be free from inherent mechanical or electrical defects for one (1) year from the date of final acceptance of the system.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

#### 1.6 DESIGN CRITERIA

- A. The equipment and completed installation shall be in compliance with local and national codes, authorities having jurisdiction, the local Fire Department, and in accordance with applicable sections of the latest edition of NFPA 72 for Fire Alarm Systems.
- B. All equipment shall be listed by National Fire Protection Association, Underwriters Laboratories and/or the Factory Mutual System.
- C. The equipment manufacturer shall have a local branch office within 75 miles staffed with trained, full time employees who are capable of performing testing, inspecting, repair and maintenance services for the life of the manual alarm system.
- D. All components of the system shall have been tested for compatibility with each other to ensure the system performs all intended functions.
- E. The system shall be have the following alarm zones

1. KOH & NaOCL Room
2. NaHS03 Room
3. Spare
4. Spare

F. System Operation

1. The operation of a manual station outside in a zone shall automatically:
  - i. Sound a temporal signal over all audio circuits, signal shall not be a temporal code 3 or code 4.
  - ii. Flash all visual signals associated with the zone in a synchronized manner.
  - iii. Flash an alarm LED and sound an audible signal at the Chemical Alarm Control Panel (CACP). Upon Acknowledgment, the alarm LED shall light steadily and the audible shall silence. Subsequent alarms shall re-initiate this sequence.
  - iv. Visually indicate the zone via the LCD display located at the CACP.
  - v. Close a dry contact for interconnection to the Fire Alarm system.
  - vi. Close a dry contact for interconnection to the SCADA system.
2. The activation of a system trouble condition (system battery, broken circuit, ground fault, device failure, communication failure ect.)
  - i. Initiate the transmission of the trouble condition to an approved private monitoring station via a Digital Alarm Communicator/Transmitter (DACT).
  - ii. Indicate the trouble condition and sound an audible signal at the FACP

G. System Wiring

1. The system shall be wired, connected, and left in first class operating condition. Wiring shall be provided and installed in accordance with the manufacturers Drawings. The Contract Drawings indicate the devices required for each building, the types of devices to be installed, and the general method for connecting the system devices together. The actual number of wires to be installed in each raceway and the size of each raceway shall be in accordance with the manufacturer's Drawings.
2. As a minimum, power supplies and notification appliance circuits shall operate all devices shown plus 25% spare capacity, and be wired in a Class A style.

H. System shall be addressable microprocessor based and shall provide the following features:

1. Individual identity of each zone for the following conditions: alarm; trouble; open; short; and appliances missing/failed.

## PART 2 –PRODUCTS

### 2.1 MANUAL ALARM CONTROL PANEL

- A. Provide micro-processor based modular components to make up a complete control system. The panel shall have the following features:
1. Alarm output relays.
  2. Zone modules, number as required for proper functionality for each system, access lamps, secure lamps, access/secure key switches for each.
  3. Earth detection module.
  4. Sealed lead acid battery standby power shall be supplied. It shall be under lock and key within this supervised cabinet to prevent deliberate tampering.
  5. Solid state battery charger.
  6. Alarm resound module.
  7. Total system supervision by a micro-processor which will supervise all wiring regardless whether or not the area of protection is bypassed or not.
  8. Quantity three normally open dry contacts which close on alarm conditions.
- B. Electrical power shall be obtained by the normal electrical distribution system. Power shall be continuously monitored and, if interrupted, automatic switching from primary to emergency backup source shall be accomplished without interruption or degradation of critical system function.
- C. Furnish 120 volt AC service, transformed through a two-winding isolation transformer and rectified to low-voltage DC for system operation. Obtain primary power at the 120V breaker as indicated in the Contract Documents.
- D. Provide lockable device at circuit breaker and label the circuit breaker in that panelboard: “Alarm System Do Not Turn Off”.
- E. Provide backup power to the primary power by dedicated batteries in the Control Panel. Batteries shall be capable of operation in any position and shall be protected against venting caustic chemicals or fumes within an equipment cabinet. Batteries shall also be capable of continuous operation for up to 4 hours without recharge or replacement. If the sensors power requirements exceed the allowable UL rated capacity of the control communicator battery, provide the number of separate power supplies required to power the sensors. Provide each power supply with its own rechargeable battery and charger.
- F. Provide system components to facilitate modular subassembly and part replacement. Electronic components of the system shall be of the solid-state type, mounted on printed circuit boards conforming to UL 796. Circuitry shall not be so densely placed

as to impede maintenance. Power-dissipating components shall incorporate safety margins of not less than 25 percent with respect to dissipation ratings, maximum voltages, and current-carrying capacity. Light duty relays and similar switching devices shall be solid-state or hermetically sealed electromechanical type.

- G. Provide only components in current manufacturing production. Components shall be manufactured to meet requirements specified herein and shall be free from characteristics and defects which affect appearance or serviceability or which render equipment unsuitable for the intended purpose. Provide components designed for continuous operation at specified conditions.
- H. Alarm detection, communication, and power circuits shall be protected against lightning and voltage transients. Surge suppression device shall conform to UL 1449, rated single pulse transient energy by metal oxide varistor (MOV). The protective device shall be automatic and resettable and shall be active at all times. Fuses shall not be permitted as protection devices.
- I. Provide control devices to ensure ease of operation of specified characteristics. Where applicable, clockwise rotation of controls shall result in an increasing function. Controls, switches, visual signals, and indicating devices, input and output connectors, terminals, and test points shall be clearly marked or labeled on hardware to permit quick identification, intended use, and location. Terminal markings and labels shall be of a permanent and legible type and located to be visible when the associated system wiring is in place. Identification markings shall be associated with each adjustment device or item requiring periodic maintenance. Safety warning or cautions shall be marked in conspicuous red letters. Controls not required for operation of the system shall be inaccessible to the system operator.
- J. Cabinets, control communicators, wiring gutters, and other component housings, collectively referred to as enclosures, shall be formed and assembled to be sturdy and rigid. Metal thickness shall not be less than those in Tables 8.1, 8.2, and 8.3 of UL 1610 for alarm components, and NEMA ICS 2 and NEMA ICS 6 for other enclosures.
- K. Doors and covers shall be flanged. Where doors are mounted on hinges with exposed pins, hinges shall be of the tight-pin type, or ends of hinge pins shall be tack welded to prevent ready removal. Provide doors having a latch edge length of less than 24 inches with a single lock. Covers of junction boxes provided to facilitate initial installation of the system shall be held in place by tack welding, brazing, or one-way screws.
- L. Ventilation openings in enclosures and cabinets shall conform to the requirements of UL 1610. Sheet metal enclosures shall be designed for surface or recessed wall mounting with top hole slotted.
- M. Locks and key-lock-operated switches required to be installed on component enclosures shall be UL listed, round-key type with three dual, one mushroom, and three plain pin tumblers, or shall have a pick resistance equal to a lock having a combination of five cylinder pin and five-point three-position side bar in the same lock. Keys shall be stamped "DO NOT DUP". Key-lock-operated switches shall be keyed differently.

## 2.2 SYSTEM DEVICES

- A. Surface mounted combination horn/strobe Audio/Visual signaling appliances with a white housing and amber colored lens. Specific audible and visual characteristics shall be as follows:
  - 1. Visual Signals: Furnish and install self-synchronizing xenon strobes in compliance with NFPA 72 chapter 6. Strobes shall have an effective intensity rating of 15 candela in corridors and other areas up to 20' x 20', 30 candela in areas up to 30' x 30' and 110 candela in areas up to 50' x 50'.
  - 2. Audible Signals: Provide multi-tapped horns. Each horn shall have selective 3, 2, 1, or 2 watt taps to produce a minimum sound output of 87dbA at 10'. Provide re-entrant speakers in high ambient noise areas or where weatherproof devices are required.
- B. Manual Pull Stations: Provide manual stations where shown on Contract Drawings and required. The station shall be double action type with screw terminals, toggle switch, and integral addressable electronics. The station shall be constructed of yellow Lexan with white raised letters and a key reset switch. The station shall be keyed alike to the control panel.
- C. Devices located within the chemical areas shall be weatherproof type of corrosion resistant material.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Installation shall be supervised and tested by the system supplier. The work shall be performed by skilled technicians under the direction of experienced engineers, all of whom are properly trained and qualified.
- B. All wiring for the system shall be in accordance with Articles 760, 725, and 800 of the National Electrical Code and local electrical codes.
- C. Wiring shall be No. 14AWG Type XHHW copper type. All wiring shall be color coded. All wiring shall be tagged at each junction point. Proper connectors shall be installed at terminations to accept the No. 14 AWG wiring.
- D. Provide complete wiring and conduit between all equipment. All devices shall be mounted upon and splices made in UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted. All wiring shall be installed in raceway as specified in SECTION 16130, RACEWAYS AND FITTINGS
- E. No conduit smaller than 3/4 inch shall be installed.
- F. Conduit sizes and wire quantities shall be suitable for the equipment furnished. The Electrical FSB shall review the proper installation of each type of device with the equipment supplier.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout
- B. Training

- 1. Provide the services of the manufacturer's representative for a period of 4 hours, during normal business hours, to instruct the owner's designated personnel and fire department response teams on the operation of the system.

### 3.3 SPARE PARTS

- A. Provide one pull station and one audio/visual device of each type to the Owner at the conclusion of all work.

### 3.4 MANUAL ALARM TEST AND INSPECTION CONTRACT

- A. The Electrical FSB shall include as part of their base bid the cost of a one-year test and inspection contract. This contract shall provide for quarterly tests according to UL, NFPA and local requirements. Upon its expiration, the contract shall be renewable by the town.

END OF SECTION 16722

## SECTION 16740

### COMMUNICATION SYSTEM

(Part of Filed Sub-Bid Section 16001 – ELECTRICAL WORK – Filed Sub-Bid Required)

#### PART 1 – GENERAL

##### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplemental Conditions, Division 0 and Division 1 Specification Sections, apply to this section.

##### 1.2 SUMMARY OF WORK

- A. The Work of this Section includes the furnishing and installing of complete telephone and data system as specified in the Contract Documents.
- B. The system shall include, but not be limited to plywood backboards, conduit, cable, back boxes, jacks, wall plates, fittings, terminations, equipment rack, patch panels, punch down panels, PoE Ethernet switch, UPS, patch cords, and all other appurtenances leaving the entire installation complete.
- C. Terminate all CAT 6E cable at patch panel (Data, Camera, and control panels) and punch down panels (Telephone) mounted in equipment rack.
- D. Provide all required coordination with Owner's service provider and Owner.

##### 1.3 SUBMITTALS

- A. Manufacturer's literature and brochures shall be submitted for all items to be furnished in accordance with the provisions of Section 01300 – Submittals.
- B. Submittals required under this section include, but are not limited to the following:
  - 1. CAT 6E Cable and Jacks
  - 2. Fiber Optic Cable and Terminations.
  - 3. Equipment Rack
  - 4. Patch Panels
  - 5. Punch Down Panel
  - 6. PoE Ethernet Switch
  - 7. Uninterrupted power supply (UPS).
  - 8. Patch Cords

## 1.4 QUALITY ASSURANCE

### A. Testing

1. All cables shall be tested for continuity per manufacturer's specifications.

## 1.5 DELIVERY, STORAGE, AND HANDLING

- ### A. All materials shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance.

## PART 2 –PRODUCTS

### 2.1 CAT 6E CABLE AND JACKS

- #### A. Cable shall be CAT 6E type having four each individually twisted pair, 23 AWG conductors with a blue PVC jacket.
- #### B. Jacks and Jack Assemblies shall be Modular, color-coded, eight-position modular receptacle units with integral IDC-type terminals. Provide device wall plates for each jack, wall plates shall be as specified under SECTION 16500, LIGHTING SYSTEMS.

### 2.2 FIBER OPTIC CABLE

- #### A. 50uM Multi Mode OM3 Type, ANSI/ICEA S-104-696 listed, Loose Tube, Gel-Free Plenum Cable, 6-Strand and 12-Strand (OM3).
- #### B. Provide all end connectors and test complete cable end to end, all terminations and testing shall be by a certified fiber optic technician.

### 2.3 EQUIPMENT RACK

- #### A. Provide a Steel equipment rack enclosure with uniform, baked-enamel factory finish over rust-inhibiting primer.
- #### B. Rack shall be wall Mounted, 36 inches high, 22” inches wide (19” wide equipment mounting), 30 inches deep with center swing section and plexiglas front door.
- #### C. Rack to have universal hole pattern on front and rear flanges, and mounting 10-32 threaded mounting holes on both sides of rack assembly.
- #### D. Rack to have grounding bus bar and is to be grounded building grounding system.
- #### E. Rack to have top mounted plug in type ventilation fan.
- #### F. Provide with full vertical mounted power distribution strip consisting of grounded receptacles a master power on/off switch, pilot light and surge protection.

## 2.4 PoE ETHERNET SWITCH

- A. The PoE Ethernet switch shall be rack mounted Layer-3 Managed type with 24 auto sensing 10/100/1000BASE-T PoE ports and two GbE fiber ports. All ports shall support auto negotiation or manual configuration for 10/100/1000 MHz or full/half duplex.
- B. The Ethernet switches shall be full IEEE 802.1 and full IEEE 802.3 compliant. The switch shall support 10/100/1000BASE-T and 1000BASE-SX standards. The switch shall support IEEE flow control, LACP port trunk, and energy efficient ethernet. Port setting controls shall include enable/disable and speed selection. The switch shall use store-and-forward switching mode.
- C. The Ethernet switches shall have an LED power indicator and shall operate from a 120VAC power source. The switch MSR LED, PoE LED, and port link status LED. The switches shall be suitable for operating from -25°C to 65°C fan less and from 5 percent to 95 percent non-condensing relative humidity. The switch shall be UL approved.
- D. Ports to support both 15.4 W and 30W high power with a total power budget of 720W.
- E. Layer 3 managed routing shall support IPv4/IPv6, RIP v1.v2 OSPF-v2 routing, VRRP routing redundancy and IGMPv1/v2/v3, DVMRP, PIM-SM, SIM-SSM Multicasting.
- F. The Ethernet switch shall support a tree or ring network topology. The switch shall support SNMPv3 and IP addressing via BootP/DHCP. The port configurations shall be accessible through a standard Web browser.
- G. The Ethernet switch security features shall include capability to disable ports and password security for configuration. The switch shall support multicast messaging via IGMP protocol and shall utilize IGMP snooping. The switch shall support port based virtual LAN (VLAN) configuration. The switch shall support the IEEE 802.1p standard for QoS traffic prioritization. The switch shall come supplied with configuration and management software for installation on a Windows-based PC. The switch shall come supplied with all necessary cables to connect the switch to a Windows-based PC for configuration.

## 2.5 UNINTERRUPTABLE POWER SUPPLIES (UPS)

- A. For each equipment rack provide a 2200VA 19" wide rack mounted UPS with LCD display and LED status indicators for battery status.
- B. Input Power: 120VAC, single phase via 8 foot cord with a NEMA 5-20P plug.
- C. Output Power: 120VAC, single phase via (6) NEMA 5-15R and (2) NEMA 5-20R rear mounted receptacles.
- D. Interface ports: Serial (RJ45), USB, and SmartSlot.
- E. Surge Energy Rating: 480J

- F. Filtering: Full-time multi-pole noise filtering with 0.3% IEEE surge let-through, zero clamping response time and meets UL 1449.

## 2.6 PATCH PANEL

- A. Provide a 19” wide rack mounted high density patch panel with a minimum 48 port with integral cable management panel located below the patch panel.
- B. Provide a wall mounted patch down panel with 12 ports for mounting on Tele/Comm backboard for interface to service provider’s telephone and internet equipment.
- C. Wiring shall conform with T568B wiring.

## 2.7 PATCH PANEL – FIBER OPTIC CABLE

- A. Provide wall mounted enclosed pre-loaded patch panels with a minimum 12 ports, SC connectors, cable spools, and hinged lockable door.

## 2.8 PUNCH DOWN PANELS

- A. Provide a 19” wide 110 rack mounted punch down panel with minimum 50 pair blocks and integral cable management panel located below the punch down panel.

## 2.9 PATCH CORDS

- A. Provide 20 factory manufactured CAT 6E, 3’ long patch cords ETL verified to TIA-568-B for interconnections between patch panels and ethernet switch.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. Coordinate location of rack mounted equipment with owner prior to making any terminations.
- B. Coordinate type of jack module in each tele/data wall plate with owner prior to making any terminations.
- C. Cables shall be terminated with connecting hardware of same category or higher that shall comply with TIA/EIA-568-B.2, IDC type, with modules designed for punch-down caps or tools.
- D. All cables and wall jacks shall be labeled, comply with TIA/EIA-606-A and UL 969 for labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

### 3.2 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01700 – Contract Closeout

END OF SECTION 16740

Secretary

MICHAEL FLANAGAN  
Director

**Awarding Authority:** Town of Sharon  
**Contract Number:** **City/Town:** SHARON  
**Description of Work:** Construction of the Wells 2, 3, and 4 Water Treatment Plant and modifications to existing Well Stations.  
**Job Location:** 15 Tree Lane, Sharon, Massachusetts

---

Information about Prevailing Wage Schedules for Awarding Authorities and Contractors

- **The wage rates will remain in effect for the duration of the project, except in the case of multi-year public construction projects. For construction projects lasting longer than one year, awarding authorities must request an updated wage schedule no later than two weeks before the anniversary of the date the contract was executed by the awarding authority and the general contractor.** For multi-year CM AT RISK projects, the awarding authority must request an annual update no later than two weeks before the anniversary date, determined as the earlier of: (a) the execution date of the GMP Amendment, or (b) the execution date of the first amendment to permit procurement of construction services. The annual update requirement is not applicable to 27F "rental of equipment" contracts. **The updated wage schedule must be provided to all contractors, including general and sub-contractors, working on the construction project.**
- This wage schedule applies only to the specific project referenced at the top of this page and uniquely identified by the "Wage Request Number" on all pages of this schedule.
- An Awarding Authority must request an updated wage schedule if it has not opened bids or selected a contractor within 90 days of the date of issuance of the wage schedule. For CM AT RISK projects (bid pursuant to G.L. c.149A), the earlier of: (a) the execution date of the GMP Amendment, or (b) the bid for the first construction scope of work must be within 90-days of the wage schedule issuance date.
- The wage schedule shall be incorporated in any advertisement or call for bids for the project as required by M.G.L. c. 149, § 27. The wage schedule shall be made a part of the contract awarded for the project. The wage schedule must be posted in a conspicuous place at the work site for the life of the project in accordance with M.G.L. c. 149 § 27. The wages listed on the wage schedule must be paid to employees performing construction work on the project whether they are employed by the prime contractor, a filed sub-bidder, or a sub-contractor.
- Apprentices working on the project are required to be registered with the Massachusetts Division of Apprentice Standards (DAS). Apprentices must keep their apprentice identification card on their persons during all work hours on the project. An apprentice registered with DAS may be paid the lower apprentice wage rate at the applicable step as provided on the prevailing wage schedule. **Any apprentice not registered with DAS regardless of whether they are registered with another federal, state, local, or private agency must be paid the journeyworker's rate.**
- Every contractor or subcontractor working on the construction project must submit weekly payroll reports and a Statement of Compliance directly to the awarding authority by mail or email and keep them on file for three years. Each weekly payroll report must contain: the employee's name, address, occupational classification, hours worked, and wages paid. Do not submit weekly payroll reports to DLS. For a sample payroll reporting form go to <http://www.mass.gov/dols/pw>.
- Contractors with questions about the wage rates or classifications included on the wage schedule have an affirmative obligation to inquire with DLS at (617) 626-6953.
- Contractors must obtain the wage schedules from awarding authorities. Failure of a contractor or subcontractor to pay the prevailing wage rates listed on the wage schedule to all employees who perform construction work on the project is a violation of the law and subjects the contractor or subcontractor to civil and criminal penalties.
- Employees not receiving the prevailing wage rate set forth on the wage schedule may file a complaint with the Fair Labor Division of the office of the Attorney General at (617) 727-3465.

Additional Apprentices Information:

Minimum wage rates for apprentices employed on public works projects are listed above as a percentage of the pre-determined hourly wage rate established by the Commissioner under the provisions of the M.G.L. c. 149, ss. 26-27D. Apprentices ratios are established by the Division of Apprenticeship Training pursuant to M.G.L. c. 23, ss. 11E-11L.

All apprentices must be registered with the Division of Apprenticeship Training in accordance with M.G.L. c. 23, ss. 11E-11L.

All steps are six months (1000 hours.)

Ratios are expressed in allowable number of apprentices to journeymen or fraction thereof, unless otherwise specified.

\*\* Multiple ratios are listed in the comment field.

\*\*\* APP to JM; 1:1, 2:2, 2:3, 3:4, 4:4, 4:5, 4:6, 5:7, 6:7, 6:8, 6:9, 7:10, 8:10, 8:11, 8:12, 9:13, 10:13, 10:14, etc.

\*\*\*\* APP to JM; 1:1, 1:2, 2:3, 2:4, 3:5, 4:6, 4:7, 5:8, 6:9, 6:10, 7:11, 8:12, 8:13, 9:14, 10:15, 10:16, etc.

## APPENDIX B

### Davis Bacon Act Requirements

## **APPENDIX G**

### **Davis Bacon Act Requirements**

All construction projects are subject to the Davis Bacon wage rate requirements and must include the appropriate sections of the following document in its entirety in the contract documents.

**The vast majority of SRF projects will be bid by Governmental Entities (i.e., Cities, Towns, Authorities, Water Districts, Wastewater Districts). These projects must include the following language in construction contracts:**

**I.3. Contract and Subcontract Provisions**

**I.4. Contract Provisions for Contracts in Excess of \$100,000 (if applicable)**

**I.5. Compliance Verification**

**This language may be found on pages DB-3-DB-11.**

**In certain cases, SRF projects may be bid by non-Governmental Entities (i.e., private water companies, private PWSs, etc.). These projects must include the following language in construction contracts:**

**II.3. Contract and Subcontract Provisions**

**II.4. Contract Provisions for Contracts in Excess of \$100,000 (if applicable)**

**II.5. Compliance Verification**

**This language may be found on pages DB-11-DB-21**

#### **Preamble**

With respect to the Clean Water and Safe Drinking Water State revolving Funds, EPA provides capitalization grants to each State which in turn provides subgrants or loans to eligible entities within the State. Typically, the subrecipients are municipal or other local governmental entities that manage the funds. For these types of recipients, the provisions set forth under Roman Numeral I, below, shall apply. Although EPA and the State remain responsible for ensuring subrecipients' compliance with the wage rate requirements set forth herein, those subrecipients shall have the primary responsibility to maintain payroll records as described in Section 3(ii)(A), below and for compliance as described in Section I-5.

Occasionally, the subrecipient may be a private for profit or not for profit entity. For these types of recipients, the provisions set forth in Roman Numeral II, below, shall apply. Although EPA and the State remain responsible for ensuring subrecipients' compliance with the wage rate requirements set forth herein, those subrecipients shall have the primary responsibility to maintain payroll records as described in Section II-3(ii)(A), below and for compliance as described in Section II-5.

#### **I. Requirements For Subrecipients That Are Governmental Entities:**

The following terms and conditions specify how recipients will assist EPA in meeting its Davis-Bacon (DB) responsibilities when DB applies to EPA awards of financial assistance with respect to State recipients and subrecipients that are governmental entities. If a subrecipient has

questions regarding when DB applies, obtaining the correct DB wage determinations, DB provisions, or compliance monitoring, it may contact the State recipient. If a State recipient needs guidance, the recipient may contact Valerie Marshall at EPA Region 1 (617-918-1674) for guidance. The recipient or subrecipient may also obtain additional guidance from DOL's web site at <https://www.dol.gov/whd/govcontracts/dbra.htm>

## **1. Applicability of the Davis- Bacon (DB) prevailing wage requirements.**

DB prevailing wage requirements apply to the construction, alteration, and repair of treatment works carried out in whole or in part with assistance made available by a State water pollution control revolving fund and to any construction project carried out in whole or in part by assistance made available by a drinking water treatment revolving loan fund. If a subrecipient encounters a unique situation at a site that presents uncertainties regarding DB applicability, the subrecipient must discuss the situation with the recipient State before authorizing work on that site.

## **2. Obtaining Wage Determinations.**

(a) Subrecipients shall obtain the wage determination for the locality in which a covered activity subject to DB will take place prior to issuing requests for bids, proposals, quotes or other methods for soliciting contracts (solicitation) for activities subject to DB. These wage determinations shall be incorporated into solicitations and any subsequent contracts. Prime contracts must contain a provision requiring that subcontractors follow the wage determination incorporated into the prime contract.

(i) While the solicitation remains open, the subrecipient shall monitor [www.wdol.gov](http://www.wdol.gov) weekly to ensure that the wage determination contained in the solicitation remains current. The subrecipients shall amend the solicitation if DOL issues a modification more than 10 days prior to the closing date (i.e. bid opening) for the solicitation. If DOL modifies or supersedes the applicable wage determination less than 10 days prior to the closing date, the subrecipients may request a finding from the State recipient that there is not a reasonable time to notify interested contractors of the modification of the wage determination. The State recipient will provide a report of its findings to the subrecipient.

(ii) If the subrecipient does not award the contract within 90 days of the closure of the solicitation, any modifications or supersedes DOL makes to the wage determination contained in the solicitation shall be effective unless the State recipient, at the request of the subrecipient, obtains an extension of the 90 day period from DOL pursuant to 29 CFR 1.6(c)(3)(iv). The subrecipient shall monitor [www.wdol.gov](http://www.wdol.gov) on a weekly basis if it does not award the contract within 90 days of closure of the solicitation to ensure that wage determinations contained in the solicitation remain current.

(b) If the subrecipient carries out activity subject to DB by issuing a task order, work assignment or similar instrument to an existing contractor (ordering instrument) rather than by publishing a solicitation, the subrecipient shall insert the appropriate DOL wage determination from [www.wdol.gov](http://www.wdol.gov) into the ordering instrument.

(c) Subrecipients shall review all subcontracts subject to DB entered into by prime contractors to verify that the prime contractor has required its subcontractors to include the applicable wage determinations.

(d) As provided in 29 CFR 1.6(f), DOL may issue a revised wage determination applicable to a subrecipient's contract after the award of a contract or the issuance of an ordering instrument if DOL determines that the subrecipient has failed to incorporate a wage determination or has used a wage determination that clearly does not apply to the contract or ordering instrument. If this occurs, the subrecipient shall either terminate the contract or ordering instrument and issue a revised solicitation or ordering instrument or incorporate DOL's wage determination retroactive to the beginning of the contract or ordering instrument by change order. The subrecipient's contractor must be compensated for any increases in wages resulting from the use of DOL's revised wage determination.

### **3. Contract and Subcontract provisions.**

(a) The Recipient shall insure that the subrecipient(s) shall insert in full in any contract in excess of \$2,000 which is entered into for the actual construction, alteration and/or repair, including painting and decorating, of a treatment work under the CWSRF or a construction project under the DWSRF financed in whole or in part from Federal funds or in accordance with guarantees of a Federal agency or financed from funds obtained by pledge of any contract of a Federal agency to make a loan, grant or annual contribution (except where a different meaning is expressly indicated), and which is subject to the labor standards provisions of any of the acts listed in § 5.1 or the FY 2012 Appropriations Act, the following clauses:

(1) Minimum wages.

(i) All laborers and mechanics employed or working upon the site of the work will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics.

Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (a)(1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in §5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein:

Provided, that the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under paragraph (a)(1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers. Subrecipients may obtain wage determinations from the U.S. Department of Labor's web site, [www.dol.gov](http://www.dol.gov).

(ii)(A) The subrecipient(s), on behalf of EPA, shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The State award official shall approve a request for an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

- (1) The work to be performed by the classification requested is not performed by a classification in the wage determination; and
- (2) The classification is utilized in the area by the construction industry; and
- (3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the subrecipient(s) agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), documentation of the action taken and the request, including the local wage determination shall be sent by the subrecipient (s) to the State award official. The State award official will transmit the request, to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210 and to the EPA DB Regional Coordinator concurrently. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification request within 30 days of receipt and so advise the State award official or will notify the State award official within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the subrecipient(s) do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the award official shall refer the request and the local wage determination, including the views of all interested parties and the recommendation of the State award official, to the Administrator for determination. The request shall be sent to the EPA DB Regional Coordinator concurrently. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt of the request and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(ii)(B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

(2) Withholding. The subrecipient(s), shall upon written request of the EPA Award Official or an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work, all or part of the wages required by the contract, the (Agency) may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

(3) Payrolls and basic records.

(i) Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work. Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii)(A) The contractor shall submit weekly, for each week in which any contract work is performed, a copy of all payrolls to the subrecipient, that is, the entity that receives the sub-grant or loan from the State capitalization grant recipient. Such documentation shall be available on request of the State recipient or EPA. As to each payroll copy received, the subrecipient shall provide written confirmation in a form satisfactory to the State indicating whether or not the project is in compliance with the requirements of 29 CFR 5.5(a)(1) based on the most recent payroll copies for the specified week. The payrolls shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on the weekly payrolls. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g., the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is available for this purpose from the Wage and Hour Division Web site at <https://www.dol.gov/whd/forms/wh347.pdf> or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker, and shall provide them upon request to the subrecipient(s) for transmission to the State or EPA if requested by EPA, the State, the contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to the subrecipient(s).

(B) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(1) That the payroll for the payroll period contains the information required to be provided under § 5.5 (a)(3)(ii) of Regulations, 29 CFR part 5, the appropriate information is being maintained under § 5.5 (a)(3)(i) of Regulations, 29 CFR part 5, and that such information is correct and complete;

(2) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;

(3) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph (a)(3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

(iii) The contractor or subcontractor shall make the records required under paragraph (a)(3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the State, EPA or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the Federal agency or State may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

(4) Apprentices and trainees--

(i) Apprentices. Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship Training, Employer and Labor Services, or with a State Apprenticeship Agency recognized by the Office, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Office of Apprenticeship Training, Employer and Labor Services or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Office of Apprenticeship Training, Employer and Labor Services, or a State Apprenticeship Agency recognized by the Office, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees. Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal employment opportunity. The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

- (5) Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.
- (6) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR 5.5(a)(1) through (10) and such other clauses as the EPA determines may be appropriate, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.
- (7) Contract termination; debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.
- (8) Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.
- (9) Disputes concerning labor standards. Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29

CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and Subrecipient(s), State, EPA, the U.S. Department of Labor, or the employees or their representatives.

(10) Certification of eligibility.

(i) By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 U.S.C. 1001.

**4. Contract Provision for Contracts in Excess of \$100,000.**

(a) Contract Work Hours and Safety Standards Act. The subrecipient shall insert the following clauses set forth in paragraphs (a)(1), (2), (3), and (4) of this section in full in any contract in an amount in excess of \$100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by Item 3, above or 29 CFR 4.6. As used in this paragraph, the terms laborers and mechanics include watchmen and guards.

(1) Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.

(2) Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph (a)(1) of this section the contractor and any subcontractor responsible therefore shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (a)(1) of this section, in the sum of \$10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (a)(1) of this section.

(3) Withholding for unpaid wages and liquidated damages. The subrecipient, upon written request of the EPA Award Official or an authorized representative of the Department of Labor, shall withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other

Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (b)(2) of this section.

(4) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraph (a)(1) through (4) of this section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (a)(1) through (4) of this section.

(b) In addition to the clauses contained in Item 3, above, in any contract subject only to the Contract Work Hours and Safety Standards Act and not to any of the other statutes cited in 29 CFR 5.1, the Subrecipient shall insert a clause requiring that the contractor or subcontractor shall maintain payrolls and basic payroll records during the course of the work and shall preserve them for a period of three years from the completion of the contract for all laborers and mechanics, including guards and watchmen, working on the contract. Such records shall contain the name and address of each such employee, social security number, correct classifications, hourly rates of wages paid, daily and weekly number of hours worked, deductions made, and actual wages paid. Further, the Subrecipient shall insert in any such contract a clause providing that the records to be maintained under this paragraph shall be made available by the contractor or subcontractor for inspection, copying, or transcription by authorized representatives of the (write the name of agency) and the Department of Labor, and the contractor or subcontractor will permit such representatives to interview employees during working hours on the job.

## **5. Compliance Verification**

(a) The subrecipient shall periodically interview a sufficient number of employees entitled to DB prevailing wages (covered employees) to verify that contractors or subcontractors are paying the appropriate wage rates. As provided in 29 CFR 5.6(a)(6), all interviews must be conducted in confidence. The subrecipient must use Standard Form 1445 (SF 1445) or equivalent documentation to memorialize the interviews. Copies of the SF 1445 are available from EPA on request.

(b) The subrecipient shall establish and follow an interview schedule based on its assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. At a minimum, the subrecipient should conduct interviews with a representative group of covered employees within two weeks of each contractor or subcontractor's submission of its initial weekly payroll data and two weeks prior to the estimated completion date for the contract or subcontract. Subrecipients must conduct more frequent interviews if the initial interviews or other information indicates that there is a risk that the contractor or subcontractor is not complying with DB. Subrecipients shall immediately conduct necessary interviews in response to an alleged violation of the prevailing wage requirements. All interviews shall be conducted in confidence.

(c) The subrecipient shall periodically conduct spot checks of a representative sample of weekly payroll data to verify that contractors or subcontractors are paying the appropriate wage rates. The subrecipient shall establish and follow a spot check schedule based on its

assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. At a minimum, if practicable, the subrecipient should spot check payroll data within two weeks of each contractor or subcontractor's submission of its initial payroll data and two weeks prior to the completion date the contract or subcontract. Subrecipients must conduct more frequent spot checks if the initial spot check or other information indicates that there is a risk that the contractor or subcontractor is not complying with DB. In addition, during the examinations the subrecipient shall verify evidence of fringe benefit plans and payments thereunder by contractors and subcontractors who claim credit for fringe benefit contributions.

(d) The subrecipient shall periodically review contractors and subcontractors use of apprentices and trainees to verify registration and certification with respect to apprenticeship and training programs approved by either the U.S Department of Labor or a state, as appropriate, and that contractors and subcontractors are not using disproportionate numbers of, laborers, trainees and apprentices. These reviews shall be conducted in accordance with the schedules for spot checks and interviews described in Item 5(b) and (c) above.

(e) Subrecipients must immediately report potential violations of the DB prevailing wage requirements to the EPA DB contact listed above and to the appropriate DOL Wage and Hour District Office listed at [https://www.dol.gov/whd/whd\\_district\\_offices.pdf](https://www.dol.gov/whd/whd_district_offices.pdf).

## **II. Requirements For Subrecipients That Are Not Governmental Entities**

The following terms and conditions specify how recipients will assist EPA in meeting its DB responsibilities when DB applies to EPA awards of financial assistance with respect to subrecipients that are not governmental entities. If a subrecipient has questions regarding when DB applies, obtaining the correct DB wage determinations, DB provisions, or compliance monitoring, it may contact the State recipient for guidance. If a State recipient needs guidance, the recipient may contact Valerie Marshall at EPA Region 1 (617-918-1674) for guidance. The recipient or subrecipient may also obtain additional guidance from DOL's web site at <https://www.dol.gov/whd/govcontracts/dbra.htm>

**Under these terms and conditions, the subrecipient must submit its proposed DB wage determinations to the State recipient for approval prior to including the wage determination in any solicitation, contract task orders, work assignments, or similar instruments to existing contractors.**

### **1. Applicability of the Davis- Bacon (DB) prevailing wage requirements.**

DB prevailing wage requirements apply to the construction, alteration, and repair of treatment works carried out in whole or in part with assistance made available by a State water pollution control revolving fund and to any construction project carried out in whole or in part by assistance made available by a drinking water treatment revolving loan fund. If a subrecipient encounters a unique situation at a site that presents uncertainties regarding DB applicability, the subrecipient must discuss the situation with the recipient State before authorizing work on that site.

### **2. Obtaining Wage Determinations.**

(a) Subrecipients must obtain proposed wage determinations for specific localities at [www.wdol.gov](http://www.wdol.gov). After the Subrecipient obtains its proposed wage determination, it must submit the wage determination to (insert contact information for State recipient DB point of contact for wage determination) for approval prior to inserting the wage determination into a solicitation, contract or issuing task orders, work assignments or similar instruments to existing contractors (ordering instruments unless subsequently directed otherwise by the State recipient Award Official).

(b) Subrecipients shall obtain the wage determination for the locality in which a covered activity subject to DB will take place prior to issuing requests for bids, proposals, quotes or other methods for soliciting contracts (solicitation) for activities subject to DB. These wage determinations shall be incorporated into solicitations and any subsequent contracts. Prime contracts must contain a provision requiring that subcontractors follow the wage determination incorporated into the prime contract.

(i) While the solicitation remains open, the subrecipient shall monitor [www.wdol.gov](http://www.wdol.gov) on a weekly basis to ensure that the wage determination contained in the solicitation remains current. The subrecipients shall amend the solicitation if DOL issues a modification more than 10 days prior to the closing date (i.e. bid opening) for the solicitation. If DOL modifies or supersedes the applicable wage determination less than 10 days prior to the closing date, the subrecipients may request a finding from the State recipient that there is not a reasonable time to notify interested contractors of the modification of the wage determination. The State recipient will provide a report of its findings to the subrecipient.

(ii) If the subrecipient does not award the contract within 90 days of the closure of the solicitation, any modifications or supersedes DOL makes to the wage determination contained in the solicitation shall be effective unless the State recipient, at the request of the subrecipient, obtains an extension of the 90 day period from DOL pursuant to 29 CFR 1.6(c)(3)(iv). The subrecipient shall monitor [www.wdol.gov](http://www.wdol.gov) on a weekly basis if it does not award the contract within 90 days of closure of the solicitation to ensure that wage determinations contained in the solicitation remain current.

(c) If the subrecipient carries out activity subject to DB by issuing a task order, work assignment or similar instrument to an existing contractor (ordering instrument) rather than by publishing a solicitation, the subrecipient shall insert the appropriate DOL wage determination from [www.wdol.gov](http://www.wdol.gov) into the ordering instrument.

(d) Subrecipients shall review all subcontracts subject to DB entered into by prime contractors to verify that the prime contractor has required its subcontractors to include the applicable wage determinations.

(e) As provided in 29 CFR 1.6(f), DOL may issue a revised wage determination applicable to a subrecipient's contract after the award of a contract or the issuance of an ordering instrument if DOL determines that the subrecipient has failed to incorporate a wage determination or has used a wage determination that clearly does not apply to the contract or ordering instrument. If this occurs, the subrecipient shall either terminate the contract or ordering instrument and issue a revised solicitation or ordering instrument or incorporate DOL's wage determination retroactive to the beginning of the contract or ordering instrument by change order. The subrecipient's contractor must be compensated for any increases in wages resulting from the use of DOL's revised wage determination.

### 3. Contract and Subcontract provisions.

(a) The Recipient shall insure that the subrecipient(s) shall insert in full in any contract in excess of \$2,000 which is entered into for the actual construction, alteration and/or repair, including painting and decorating, of a treatment work under the CWSRF or a construction project under the DWSRF financed in whole or in part from Federal funds or in accordance with guarantees of a Federal agency or financed from funds obtained by pledge of any contract of a Federal agency to make a loan, grant or annual contribution (except where a different meaning is expressly indicated), and which is subject to the labor standards provisions of any of the acts listed in § 5.1 or the FY 2011 Full-Year Continuing Appropriation, the following clauses:

(1) Minimum wages.

(i) All laborers and mechanics employed or working upon the site of the work, will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3) ), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics. Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (a)(1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in §5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided, that the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under paragraph (a)(1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers. Subrecipients may obtain wage determinations from the U.S. Department of Labor's web site, [www.dol.gov](http://www.dol.gov).

(ii)(A) The subrecipient(s), on behalf of EPA, shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The State award official shall approve a request for an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

(1) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(2) The classification is utilized in the area by the construction industry; and

(3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the subrecipient(s) agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), documentation of the action taken and the request, including the local wage determination shall be sent by the subrecipient(s) to the State award official. The State award official will transmit the report, to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210 and to the EPA DB Regional Coordinator concurrently. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification request within 30 days of receipt and so advise the State award official or will notify the State award official within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the and the subrecipient(s) do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the award official shall refer the request, and the local wage determination, including the views of all interested parties and the recommendation of the State award official, to the Administrator for determination. The request shall be sent to the EPA Regional Coordinator concurrently. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt of the request and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(ii)(B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

(2) Withholding. The subrecipient(s) shall upon written request of the EPA Award Official or an authorized representative of the Department of Labor, withhold or cause to be withheld from the contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work, all or part of the wages required by the contract, the (Agency) may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

(3) Payrolls and basic records.

(i) Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work. Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii)(A) The contractor shall submit weekly, for each week in which any contract work is performed, a copy of all payrolls to the subrecipient, that is, the entity that receives the sub-grant or loan from the State capitalization grant recipient. Such documentation shall be available on request of the State recipient or EPA. As to each payroll copy received, the subrecipient shall provide written confirmation in a form satisfactory to the State indicating whether or not the project is in compliance with the requirements of 29 CFR 5.5(a)(1) based on the most recent payroll copies for the specified week. The payrolls shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on the weekly payrolls. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g., the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is

available for this purpose from the Wage and Hour Division Web site at <https://www.dol.gov/whd/forms/wh347.pdf> or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker, and shall provide them upon request to the subrecipient(s) for transmission to the State or EPA if requested by EPA, the State, the contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to the subrecipient(s).

(B) Each payroll submitted shall be accompanied by a “Statement of Compliance,” signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

- (1) That the payroll for the payroll period contains the information required to be provided under § 5.5 (a)(3)(ii) of Regulations, 29 CFR part 5, the appropriate information is being maintained under § 5.5 (a)(3)(i) of Regulations, 29 CFR part 5, and that such information is correct and complete;
- (2) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;
- (3) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the “Statement of Compliance” required by paragraph (a)(3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

(iii) The contractor or subcontractor shall make the records required under paragraph (a)(3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the State, EPA or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the Federal agency or State may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

(4) Apprentices and trainees--

(i) Apprentices. Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship Training, Employer and Labor Services, or with a State Apprenticeship Agency recognized by the Office, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Office of Apprenticeship Training, Employer and Labor Services or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Office of Apprenticeship Training, Employer and Labor Services, or a State Apprenticeship Agency recognized by the Office, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees. Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of

fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal employment opportunity. The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

(5) Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.

(6) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR 5.5(a)(1) through (10) and such other clauses as the EPA determines may be appropriate, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.

(7) Contract termination: debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

(8) Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.

(9) Disputes concerning labor standards. Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and Subrecipient(s), State, EPA, the U.S. Department of Labor, or the employees or their representatives.

(10) Certification of eligibility.

(i) By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 U.S.C. 1001.

#### **4. Contract Provision for Contracts in Excess of \$100,000.**

(a) Contract Work Hours and Safety Standards Act. The subrecipient shall insert the following clauses set forth in paragraphs (a)(1), (2), (3), and (4) of this section in full in any contract in an amount in excess of \$100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by Item 3, above or 29 CFR 4.6. As used in this paragraph, the terms laborers and mechanics include watchmen and guards.

- (1) Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.
- (2) Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph (b)(1) of this section the contractor and any subcontractor responsible therefore shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (b)(1) of this section, in the sum of \$10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (b)(1) of this section.
- (3) Withholding for unpaid wages and liquidated damages. The subrecipient shall upon the request of the EPA Award Official or an authorized representative of the Department of Labor, withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (b)(2) of this section.
- (4) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraph (b)(1) through (4) of this section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (b)(1) through (4) of this section.

(c) In addition to the clauses contained in Item 3, above, in any contract subject only to the Contract Work Hours and Safety Standards Act and not to any of the other statutes cited in 29 CFR 5.1, the Subrecipient shall insert a clause requiring that the contractor or subcontractor shall maintain payrolls and basic payroll records during the course of the work and shall preserve them for a period of three years from the completion of the contract for all laborers and mechanics, including guards and watchmen, working on the contract. Such records shall contain the name and address of each such employee, social security number, correct classifications, hourly rates of wages paid, daily and weekly number of hours worked, deductions made, and actual wages paid. Further, the Subrecipient shall insert in any such contract a clause providing that the records to be maintained under this paragraph shall be made available by the contractor or subcontractor for inspection, copying, or transcription by authorized representatives of the (write the name of agency) and the Department of Labor, and the contractor or subcontractor will permit such representatives to interview employees during working hours on the job.

## **5. Compliance Verification**

(a). The subrecipient shall periodically interview a sufficient number of employees entitled to DB prevailing wages (covered employees) to verify that contractors or subcontractors are paying the appropriate wage rates. As provided in 29 CFR 5.6(a)(6), all interviews must be conducted in confidence. The subrecipient must use Standard Form 1445 (SF 1445) or equivalent documentation to memorialize the interviews. Copies of the SF 1445 are available from EPA on request.

(b) The subrecipient shall establish and follow an interview schedule based on its assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. At a minimum, the subrecipient should conduct interviews with a representative group of covered employees within two weeks of each contractor or subcontractor's submission of its initial weekly payroll data and two weeks prior to the estimated completion date for the contract or subcontract. Subrecipients must conduct more frequent interviews if the initial interviews or other information indicates that there is a risk that the contractor or subcontractor is not complying with DB. Subrecipients shall immediately conduct necessary interviews in response to an alleged violation of the prevailing wage requirements. All interviews shall be conducted in confidence.

(c). The subrecipient shall periodically conduct spot checks of a representative sample of weekly payroll data to verify that contractors or subcontractors are paying the appropriate wage rates. The subrecipient shall establish and follow a spot check schedule based on its assessment of the risks of noncompliance with DB posed by contractors or subcontractors and the duration of the contract or subcontract. At a minimum, if practicable the subrecipient should spot check payroll data within two weeks of each contractor or subcontractor's submission of its initial payroll data and two weeks prior to the completion date the contract or subcontract. Subrecipients must conduct more frequent spot checks if the initial spot check or other information indicates that there is a risk that the contractor or subcontractor is not complying with DB . In addition, during the examinations the subrecipient shall verify evidence of fringe benefit plans and payments thereunder by contractors and subcontractors who claim credit for fringe benefit contributions.

(d). The subrecipient shall periodically review contractors and subcontractors use of apprentices and trainees to verify registration and certification with respect to apprenticeship and training programs approved by either the U.S Department of Labor or a state, as appropriate, and that contractors and subcontractors are not using disproportionate numbers of, laborers, trainees and apprentices. These reviews shall be conducted in accordance with the schedules for spot checks and interviews described in Item 5(b) and (c) above.

(e) Subrecipients must immediately report potential violations of the DB prevailing wage requirements to the EPA DB contact listed above and to the appropriate DOL Wage and Hour District Office listed at [https://www.dol.gov/whd/whd\\_district\\_offices.pdf](https://www.dol.gov/whd/whd_district_offices.pdf).

"General Decision Number: MA20240008 03/22/2024

Superseded General Decision Number: MA20230008

State: Massachusetts

Construction Types: Heavy (Heavy and Marine)

Counties: Barnstable, Bristol, Dukes, Essex, Middlesex, Nantucket, Norfolk, Plymouth and Suffolk Counties in Massachusetts.

HEAVY AND MARINE CONTRUCTION PROJECTS

Note: Contracts subject to the Davis-Bacon Act are generally required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658. Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(1).

<p>If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:</p>	<ul style="list-style-type: none"> <li>. Executive Order 14026 generally applies to the contract.</li> <li>. The contractor must pay all covered workers at least \$17.20 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in 2024.</li> </ul>
<p>If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:</p>	<ul style="list-style-type: none"> <li>. Executive Order 13658 generally applies to the contract.</li> <li>. The contractor must pay all covered workers at least \$12.90 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2024.</li> </ul>

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the Executive Orders and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker protections under the Executive Orders is available at <http://www.dol.gov/whd/govcontracts>.

HAZARDOUS MATERIALS (IN HOT ZONE ONLY) \$2.00 PREMIUM

TRUCK DRIVERS CLASSIFICATIONS

- Group 1: Station wagons; panel trucks; and pickup trucks
- Group 2: Two axle equipment; & forklift operator
- Group 3: Three axle equipment and tireman
- Group 4: Four and Five Axle equipment
- Group 5: Specialized earth moving equipment under 35 tons

other than conventional type trucks; low bed; vachual;  
mechanics, paving restoration equipment

Group 6: Specialized earth moving equipment over 35 tons

Group 7: Trailers for earth moving equipment (double hookup)

FOOTNOTES:

A. PAID HOLIDAYS: New Year's Day, Washington's Birthday,  
Memorial Day, Independence Day, Labor Day, Patriot's Day,  
Columbus Day, Veteran's Day, Thanksgiving Day and Christmas  
Day

B. PAID VACATION: Employees with 4 months to 1 year of  
service receive 1/2 day's pay per month; 1 week vacation  
for 1 - 5 years of service; 2 weeks vacation for 5 - 10  
years of service; and 3 weeks vacation for more than 10  
years of service

-----  
WELDERS - Receive rate prescribed for craft performing  
operation to which welding is incidental.

=====  
Note: Executive Order (EO) 13706, Establishing Paid Sick Leave  
for Federal Contractors applies to all contracts subject to the  
Davis-Bacon Act for which the contract is awarded (and any  
solicitation was issued) on or after January 1, 2017. If this  
contract is covered by the EO, the contractor must provide  
employees with 1 hour of paid sick leave for every 30 hours  
they work, up to 56 hours of paid sick leave each year.  
Employees must be permitted to use paid sick leave for their  
own illness, injury or other health-related needs, including  
preventive care; to assist a family member (or person who is  
like family to the employee) who is ill, injured, or has other  
health-related needs, including preventive care; or for reasons  
resulting from, or to assist a family member (or person who is  
like family to the employee) who is a victim of, domestic  
violence, sexual assault, or stalking. Additional information  
on contractor requirements and worker protections under the EO  
is available at  
<https://www.dol.gov/agencies/whd/government-contracts>.

Unlisted classifications needed for work not included within  
the scope of the classifications listed may be added after  
award only as provided in the labor standards contract clauses  
(29CFR 5.5 (a) (1) (iii)).

-----  
The body of each wage determination lists the classification  
and wage rates that have been found to be prevailing for the  
cited type(s) of construction in the area covered by the wage  
determination. The classifications are listed in alphabetical  
order of ""identifiers"" that indicate whether the particular  
rate is a union rate (current union negotiated rate for local),  
a survey rate (weighted average rate) or a union average rate  
(weighted union average rate).

### Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

### Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

### Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

---

### WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

- \* an existing published wage determination
- \* a survey underlying a wage determination
- \* a Wage and Hour Division letter setting forth a position on a wage determination matter
- \* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour National Office because National Office has responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations  
 Wage and Hour Division  
 U.S. Department of Labor  
 200 Constitution Avenue, N.W.  
 Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator  
 U.S. Department of Labor  
 200 Constitution Avenue, N.W.  
 Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board  
 U.S. Department of Labor  
 200 Constitution Avenue, N.W.  
 Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

=====

END OF GENERAL DECISION"

## APPENDIX C

### Massachusetts General Laws

## **APPENDIX B**

### **APPLICABLE COMMONWEALTH OF MASSACHUSETTS STATUTES**

**These following amend or supplement the Standard General Conditions of the Construction Contract (No. C-700, 2013 Edition) and other provisions of the Contract Documents as indicated below. All provisions which are not so amended or supplemented remain in full force and effect.**

#### **M.G.L c.30 s 39F Payment to Subcontractor**

Section 39F. (1) Every contract awarded pursuant to sections forty-four A to L, inclusive, of chapter one hundred and forty-nine shall contain the following subparagraphs (a) through (i) and every contract awarded pursuant to section thirty-nine M of chapter thirty shall contain the following subparagraphs (a) through (h) and in each case those subparagraphs shall be binding between the general contractor and each subcontractor.

(a) Forthwith after the general contractor receives payment on account of a periodic estimate, the general contractor shall pay to each subcontractor the amount paid for the labor performed and the materials furnished by that subcontractor, less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(b) Not later than the sixty-fifth day after each subcontractor substantially completes his work in accordance with the plans and specifications, the entire balance due under the subcontract less amounts retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, shall be due the subcontractor; and the awarding authority shall pay that amount to the general contractor. The general contractor shall forthwith pay to the subcontractor the full amount received from the awarding authority less any amount specified in any court proceedings barring such payment and also less any amount claimed due from the subcontractor by the general contractor.

(c) Each payment made by the awarding authority to the general contractor pursuant to subparagraphs (a) and (b) of this paragraph for the labor performed and the materials furnished by a subcontractor shall be made to the general contractor for the account of that subcontractor; and the awarding authority shall take reasonable steps to compel the general contractor to make each such payment to each such subcontractor. If the awarding authority has received a demand for direct payment from a subcontractor for any amount which has already been included in a payment to the general contractor or which is to be included in a payment to the general contractor for payment to the subcontractor as provided in subparagraphs (a) and (b), the awarding authority shall act upon the demand as provided in this section.

(d) If, within seventy days after the subcontractor has substantially completed the subcontract work, the subcontractor has not received from the general contractor the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount retained by the awarding authority as the estimated cost of completing the incomplete and unsatisfactory items of work, the subcontractor may demand direct payment of that balance from the awarding authority. The demand shall be by a sworn statement delivered to or sent by certified mail to the awarding authority, and a copy shall be delivered to or sent by certified mail to the general contractor at the same time. The demand shall contain a detailed breakdown of the balance due under the subcontract and also a statement of the status of completion of the subcontract work. Any demand made after substantial completion of the

subcontract work shall be valid even if delivered or mailed prior to the seventieth day after the subcontractor has substantially completed the subcontract work. Within ten days after the subcontractor has delivered or so mailed the demand to the awarding authority and delivered or so mailed a copy to the general contractor, the general contractor may reply to the demand. The reply shall be by a sworn statement delivered to or sent by certified mail to the awarding authority and a copy shall be delivered to or sent by certified mail to the subcontractor at the same time. The reply shall contain a detailed breakdown of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor and of the amount due for each claim made by the general contractor against the subcontractor.

(e) Within fifteen days after receipt of the demand by the awarding authority, but in no event prior to the seventieth day after substantial completion of the subcontract work, the awarding authority shall make direct payment to the subcontractor of the balance due under the subcontract including any amount due for extra labor and materials furnished to the general contractor, less any amount (i) retained by the awarding authority as the estimated cost of completing the incomplete or unsatisfactory items of work, (ii) specified in any court proceedings barring such payment, or (iii) disputed by the general contractor in the sworn reply; provided, that the awarding authority shall not deduct from a direct payment any amount as provided in part (iii) if the reply is not sworn to, or for which the sworn reply does not contain the detailed breakdown required by subparagraph (d). The awarding authority shall make further direct payments to the subcontractor forthwith after the removal of the basis for deductions from direct payments made as provided in parts (i) and (ii) of this subparagraph.

(f) The awarding authority shall forthwith deposit the amount deducted from a direct payment as provided in part (iii) of subparagraph (e) in an interest-bearing joint account in the names of the general contractor and the subcontractor in a bank in Massachusetts selected by the awarding authority or agreed upon by the general contractor and the subcontractor and shall notify the general contractor and the subcontractor of the date of the deposit and the bank receiving the deposit. The bank shall pay the amount in the account, including accrued interest, as provided in an agreement between the general contractor and the subcontractor or as determined by decree of a court of competent jurisdiction.

(g) All direct payments and all deductions from demands for direct payments deposited in an interest-bearing account or accounts in a bank pursuant to subparagraph (f) shall be made out of amounts payable to the general contractor at the time of receipt of a demand for direct payment from a subcontractor and out of amounts which later become payable to the general contractor and in the order of receipt of such demands from subcontractors. All direct payments shall discharge the obligation of the awarding authority to the general contractor to the extent of such payment.

(h) The awarding authority shall deduct from payments to a general contractor amounts which, together with the deposits in interest-bearing accounts pursuant to subparagraph (f), are sufficient to satisfy all unpaid balances of demands for direct payment received from subcontractors. All such amounts shall be earmarked for such direct payments, and the subcontractors shall have a right in such deductions prior to any claims against such amounts by creditors of the general contractor.

(i) If the subcontractor does not receive payment as provided in subparagraph (a) or if the general contractor does not submit a periodic estimate for the value of the labor or materials performed or furnished by the subcontractor and the subcontractor does not receive payment for same when due less the deductions provided for in subparagraph (a), the subcontractor may demand direct payment by following the procedure in subparagraph (d) and the general contractor may file a sworn reply as provided in that

same subparagraph. A demand made after the first day of the month following that for which the subcontractor performed or furnished the labor and materials for which the subcontractor seeks payment shall be valid even if delivered or mailed prior to the time payment was due on a periodic estimate from the general contractor. Thereafter the awarding authority shall proceed as provided in subparagraph (e), (f), (g) and (h).

(2) Any assignment by a subcontractor of the rights under this section to a surety company furnishing a bond under the provisions of section twenty-nine of chapter one hundred forty-nine shall be invalid. The assignment and subrogation rights of the surety to amounts included in a demand for direct payment which are in the possession of the awarding authority or which are on deposit pursuant to subparagraph (f) of paragraph (1) shall be subordinate to the rights of all subcontractors who are entitled to be paid under this section and who have not been paid in full.

(3) "Subcontractor" as used in this section (i) for contracts awarded as provided in sections forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall mean a person who files a sub-bid and receives a subcontract as a result of that filed sub-bid or who is approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, (ii) for contracts awarded as provided in paragraph (a) of section thirty-nine M of chapter thirty shall mean a person approved by the awarding authority in writing as a person performing labor or both performing labor and furnishing materials pursuant to a contract with the general contractor, and (iii) for contracts with the commonwealth not awarded as provided in forty-four A to forty-four H, inclusive, of chapter one hundred forty-nine shall also mean a person contracting with the general contractor to supply materials used or employed in a public works project for a price in excess of five thousand dollars.

(4) A general contractor or a subcontractor shall enforce a claim to any portion of the amount of a demand for direct payment deposited as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the other and the bank shall not be a necessary party. A subcontractor shall enforce a claim for direct payment or a right to require a deposit as provided in subparagraph (f) of paragraph 1 by a petition in equity in the superior court against the awarding authority and the general contractor shall not be a necessary party. Upon motion of any party the court shall advance for speedy trial any petition filed as provided in this paragraph. Sections fifty-nine and fifty-nine B of chapter two hundred thirty-one shall apply to such petitions. The court shall enter an interlocutory decree upon which execution shall issue for any part of a claim found due pursuant to sections fifty-nine and fifty-nine B and, upon motion of any party, shall advance for speedy trial the petition to collect the remainder of the claim. Any party aggrieved by such interlocutory decree shall have the right to appeal therefrom as from a final decree. The court shall not consolidate for trial the petition of any subcontractor with the petition of one or more subcontractors or the same general contract unless the court finds that a substantial portion of the evidence of the same events during the course of construction (other than the fact that the claims sought to be consolidated arise under the same general contract) is applicable to the petitions sought to be consolidated and that such consolidation will prevent unnecessary duplication of evidence. A decree in any such proceeding shall not include interest on the disputed amount deposited in excess of the interest earned for the period of any such deposit. No person except a subcontractor filing a demand for direct payment for which no funds due the general contractor are available for direct payment shall have a right to file a petition in court of equity against the awarding authority claiming a demand for direct payment is premature and such subcontractor must file the petition before the awarding authority has made a direct payment to the subcontractor and has made a deposit of the disputed portion as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1).

(5) In any petition to collect any claim for which a subcontractor has filed a demand for direct payment the court shall, upon motion of the general contractor, reduce by the amount of any deposit of a disputed amount by the awarding authority as provided in part (iii) of subparagraph (e) and in subparagraph (f) of paragraph (1) any amount held under a trustee writ or pursuant to a restraining order or injunction..

**M.G.L c.30 S 39I Deviation from Plans and Specifications**

**M.G.L c.30 s 39J No Arbitrary Decisions are Final**

**M.G.L c.30 s 39L Construction Work by Foreign Corporations**

**M.G.L c.30 s 39M(b) Substitution of Equal Products**

**M.G.L c.30 s 39N Differing Site Conditions**

Section 39N. Every contract subject to section forty-four A of chapter one hundred and forty-nine or subject to section thirty-nine M of chapter thirty shall contain the following paragraph in its entirety and an awarding authority may adopt reasonable rules or regulations in conformity with that paragraph concerning the filing, investigation and settlement of such claims:

If, during the progress of the work, the contractor or the awarding authority discovers that the actual subsurface or latent physical conditions encountered at the site differ substantially or materially from those shown on the plans or indicated in the contract documents either the contractor or the contracting authority may request an equitable adjustment in the contract price of the contract applying to work affected by the differing site conditions. A request for such an adjustment shall be in writing and shall be delivered by the party making such claim to the other party as soon as possible after such conditions are discovered. Upon receipt of such a claim from a contractor, or upon its own initiative, the contracting authority shall make an investigation of such physical conditions, and, if they differ substantially or materially from those shown on the plans or indicated in the contract documents or from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the plans and contract documents and are of such a nature as to cause an increase or decrease in the cost of performance of the work or a change in the construction methods required for the performance of the work which results in an increase or decrease in the cost of the work, the contracting authority shall make an equitable adjustment in the contract price and the contract shall be modified in writing accordingly.

**M.G.L c.30 s 39O Equitable Adjustments for Delays**

Section 39O. Every contract subject to the provisions of section thirty-nine M of this chapter or subject to section forty-four A of chapter one hundred forty-nine shall contain the following provisions (a) and (b) in their entirety and, in the event a suspension, delay, interruption or failure to act of the awarding authority increases the cost of performance to any subcontractor, that subcontractor shall have the same rights against the general contractor for payment for an increase in the cost of his performance as provisions (a) and (b) give the general contractor against the awarding authority, but nothing in provisions (a) and (b) shall in any way change, modify or alter any other rights which the general contractor or the subcontractor may have against each other.

(a) The awarding authority may order the general contractor in writing to suspend, delay, or interrupt all or any part of the work for such period of time as it may determine to be appropriate for the convenience of the awarding authority; provided however, that if there is a suspension, delay or interruption for fifteen days or more or due to a failure of the awarding authority to act within the time specified in this contract, the awarding authority shall make an adjustment in the contract price for any increase in the cost of performance of this contract but shall not include any profit to the general contractor on such increase; and provided further, that the awarding authority shall not make any adjustment in the contract price under this provision for any suspension, delay, interruption or failure to act to the extent that such is due to any cause for which this contract provides for an equitable adjustment of the contract price under any other contract provisions.

(b) The general contractor must submit the amount of a claim under provision (a) to the awarding authority in writing as soon as practicable after the end of the suspension, delay, interruption or failure to act and, in any event, not later than the date of final payment under this contract and, except for costs due to a suspension order, the awarding authority shall not approve any costs in the claim incurred more than twenty days before the general contractor notified the awarding authority in writing of the act or failure to act involved in the claim.

**M.G.L c.30 s 39P Decision on Interpretation of Specifications**

**M.G.L c.30 s 39R Contractor's Records**

**M.G.L c.149 s 44J Advertising Invitations to Bid**

**M.G.L c.82 s 40 Excavations; Notice; Penalties**

**M.G.L c.30 s 38A Price Adjustments for Certain Materials in Construction Projects**

## APPENDIX D

### Boring Logs and Geotechnical Reports

# TECHNICAL MEMORANDUM

**Date:** March 24, 2023

**To** Town of Sharon Department of Public Works

**From** Environmental Partners

**CC** File

**Subject** Wells 2, 3, and 4 Water Treatment Plant  
Town of Sharon, Massachusetts  
Geotechnical Technical Memorandum

This technical memorandum presents design information and details regarding the geotechnical investigation and construction considerations for the Wells 2, 3, and 4 Water Treatment Plant (WTP). This technical memorandum includes a description of the geotechnical drilling methods used, subsurface conditions observed, foundation design parameters, and construction considerations.

## SITE LOCATION AND DESCRIPTION

The project site is located on a property owned by the Town of Sharon (Town). The Sharon Water Department operates and manages the site at 15 Tree lane and 000 Upland Road (Town parcel IDs 101-10 and 101-11). The existing site hosts Well 4 and a small treatment building. The proposed design will include a water treatment plant (WTP) for treatment of raw water from Wells 2, 3, and 4 as well as an access road, parking area, below grade storage tanks, stormwater bioretention areas, retaining wall, and wrap around driveway. The current preliminary design for the 7,500 square-foot-building includes an administrative area; large process area for three iron and manganese removal vertical pressure filters, four per- and polyfluoroalkyl substances (PFAS) removal vertical pressure filters, chemical feed and storage areas, and an open space for future nitrate treatment; and a lower level area that includes a backwash waste storage tank, finished water wet well, and pipe gallery below the proposed process area. The administrative area will include a laboratory/control room, toilet room, electrical room, and mechanical room. Lastly, the proposed site will include a subsurface tight tank to collect wastewater. Backwash water from the iron and manganese removal and PFAS removal treatment systems will be piped to the backwash waste tank for recycle and residuals management where the settled recycle water will be pumped to the raw water inlet.

Personnel from Environmental Partners collected the ground surface elevations at the test boring locations using a hand-held GPS unit. A figure depicting the test boring locations is included as Appendix A. Site coordinates of the center of the proposed building are provided below.

*Table 1: Site Location*

Site Location	Site Coordinates in Latitude and Longitude
Well 4 (Tree Lane)	42° 07' 36.2" N 71° 11' 04.2" W

## Regional Geology

The site is in the Avalon Belt Geologic Province. The United States Geological Survey (USGS) defines the Avalon Belt Geologic Province as "Localized in eastern Massachusetts, Rhode Island, and coastal Connecticut. Principally Precambrian Z granite and granitic gneiss and metasedimentary rocks of Precambrian Z to Ordovician age. Intruded by Ordovician to Devonian granites. Cretaceous sediments and thick areas of Quaternary glacial sediments occur in southern coastal areas."

## Surface Conditions

The site topography has a local high point near Tree Lane at 240 feet North American Vertical Datum of 1988 (NAVD88) and then slopes to the west toward the existing access road and south to Well 4 and Beaver Brook, which is at an elevation of 205 feet NAVD88. It is anticipated that clearing and excavation will be required for site and subgrade preparation.

The proposed location of the WTP is wooded and abutted by Tree Lane, the existing treatment building, and the existing access road. The proposed 7,500 square foot WTP will be comprised of a pre-engineered metal building with a concrete base slab located on a parcel owned by the Town. The building will have below grade pipe gallery, backwash waste tank, and finished water wet well. A new access driveway is proposed on the east side of Tree Lane to provide access to the facility; the Town's existing private, gated road that provides access to the existing Well 4 infrastructure will remain.

The proposed WTP finished floor elevation is 226 feet NAVD88. The paved WTP access driveway shall slope up from Tree Lane to an elevation of 225 feet NAVD88, at a pitch of approximately 4%. The proposed WTP will be built partially into and on an existing hill, requiring both excavation and fill. The WTP lower level, which includes a finished water wet well, backwash waste tank, and pipe gallery, will be at approximately 214 feet or 12 feet below the FFE of the building. A wastewater tight tank will be installed outside the building footprint. The depth of the tight tank will be determined during final design based on the anticipated usage.

## SUBSURFACE EXPLORATION PROCEDURES

### Test Borings

On February 21, 22, 23, and 24, 2023, Environmental Partners retained the services of Northern Drilling Services of Northborough, MA to perform seven (7) standard penetration test (SPT) borings with an all-terrain vehicle (ATV) drilling rig. The borings were advanced via drive and wash method to predetermined depths to advance the boreholes. Wash borings consist of simultaneous drilling and jetting action. A casing is driven into the ground initially and a chopping bit attached at the end of a drilling rod is driven by a hammer and breaks up the soil in the casing. Jetting action is accomplished by pumping water downward through the drilling bit. Water emerges at the chopping bit and further serves to break up the soil. Returning water transports soil to the ground surface, where samples can be collected for further examination and classification. Such samples are disturbed samples as their water content has been increased. Soil samples were obtained at selected intervals in the soil test borings. Disturbed soil samples were obtained in general accordance with ASTM D-1587 (Thin-Walled Tube Sampling of Soils) using a standard split-spoon sampler. A split spoon sampler is a 2-inch O.D. tube that is driven into the soil to be sampled that can be split open lengthwise for easy removal and visual inspection of the soil obtained.

During the sampling procedures, standard penetration tests were performed in the borings in conjunction with the split-barrel sampling. The standard penetration value (N) is defined as the number of blows of a 140-pound hammer, falling thirty inches, is required to advance the split spoon sampler one foot into the soil (ASTM D-1585). The sampler is lowered to the bottom of the drill hole and the number of blows is recorded for each of the four successive increments of six-inch penetration. The "N" value is obtained by adding the second and third incremental numbers. The results of the standard penetration test indicate the relative density and comparative consistency of the soils, and thereby provide a basis for estimating relative strength and compressibility of the soil profile components.

Borings were advanced at each corner of the proposed WTP and in the vicinity of the proposed wet well and stormwater management basin. Approximate boring locations are indicated on Figure 1 in Appendix A of this report. These borings are identified as follows:

*Table 2: Boring Description*

Boring ID	Boring Location	Boring Depth	Boring Method	Notes
B-1	Southern Corner of Building	30 Feet	Drive & Wash	Terminated at a Predetermined Depth
B-2	Location of Wet Well / Center of Building	30 Feet		
B-3	Northern Corner of Building	41 Feet		

Boring ID	Boring Location	Boring Depth	Boring Method	Notes
B-4	Northeastern Corner of Building	41 Feet		
B-5	Southwestern Corner of Building	41 Feet		
B-6	Location of Proposed Stormwater Management Basin	21 Feet		
B-7	Northwestern Side of Building / Along Tree Lane	21 Feet		

## Soil Classification

Samples obtained during drilling operation were visually and manually classified in the field in accordance with ASTM D2488. Representative portions of the samples were collected in sample jars and selective samples were sent out to the laboratory for further examination and verification of field classifications such as gradation analysis and soil classification have been performed. Boring logs indicating depth of borings, N values, penetration and recovery depths, water levels, and soil description, can be found in Appendix B of this report.

## Loam

Topsoil and loam layers were encountered in all the borings and consisted of the upper approximately two to six inches. The loam layer was described as sandy dark brown organic layer. For planning purposes, stripping of loam and topsoil during excavation and subgrade preparation can be stockpiled and re-used as topsoil provided it meets the specifications for topsoil.

## Fill

The fill layer encountered during the subsurface program was a mix of coarse and fine sediment. The coarse sediment was characterized as brown poorly graded sand or gravel, and the fine sediment was characterized as light brown silt/sandy silt. Borings B-1 and B-5 (both southwest) were predominantly light brown silt. Boring B-3 (northeast) was predominantly poorly graded sand. The other borings located in the middle all had profiles of both coarse and fine material.

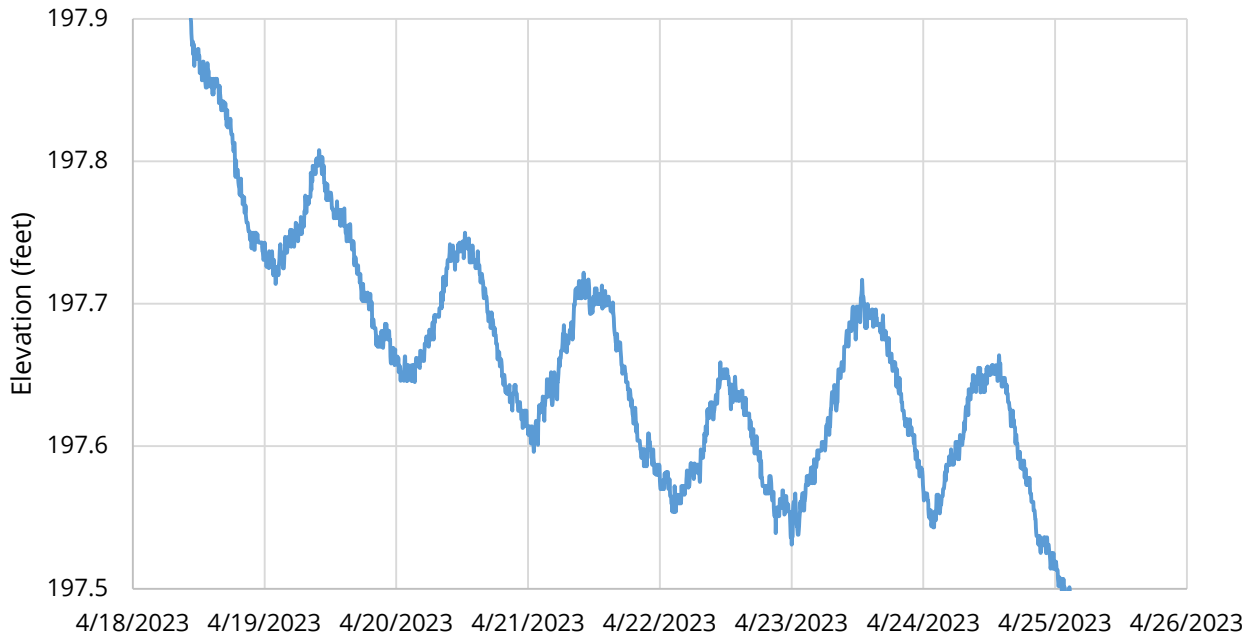

The depth of the fill layer extended from the bottom of loam (two to six inches below existing grade) to the depth of the borings. No refusal was encountered in any boring, and the pre-determined boring depths ranged from 21 to 41 feet below grade.

## Water Level Measurements

Ground water levels were measured in all borings at the completion of the boreholes. The borings encountered water at between approximately nine and 25 feet below grade (at borings B-1 and B-2, respectively). Following the completion of drilling, boring B-2 was converted into a two-inch

monitoring well for future observation and monitoring. The monitoring well was installed with a slotted screen between 25 and 30 feet below grade.

On February 24, 2023, field staff measured the depth to water at the B-2 monitoring well as 25.7 feet below grade, which corresponds to a groundwater elevation of approximately 200 feet. Environmental Partners returned to the monitoring well on April 18, 2023 and measured the depth to water at 27.2 feet below grade or 197.9 feet in elevation. Staff installed a pressure transducer to record water levels for one week. The information recorded is summarized in Figure 1, below. During the week, water levels dropped from 197.9 to 197.5 feet, or 0.4 feet.

*Figure 1: Water Table Elevation in Monitoring Well, B-2*

It should be noted however that subsurface groundwater levels can be expected to fluctuate with time, amount of precipitation, snowmelt and seasonal variations. It is a possibility that subsurface ground water levels could be significantly different than the time the borings were performed.

## Laboratory Analysis

During the subsurface investigation, EP collected soil samples at selective intervals throughout the borings for visual classifications. Laboratory tests were carried out for a number of selected soil samples to confirm the visual classification and to acquire necessary information with regards to the physical and mechanical properties of the soil layers and to evaluate and determine parameters required for soil calculations and foundation design recommendations. All phases of the laboratory-testing program were performed in general accordance with the applicable ASTM Specifications.

The following tests were conducted on the selected soil samples:

- Grain Size Distribution Tests (ASTM D6913)
- USCS Classification (ASTM D2487)

- Atterberg Limits (ASTM D4318)

Samples obtained during the field exploration were observed and visually classified in general accordance with ASTM D2488, which is based on the Unified Soil Classification System. Selective samples were sent out to Thielsch Engineering Laboratories in Cranston, Rhode Island for further testing to determine their engineering and physical properties in general accordance with ASTM standards and other approved procedures.

The laboratory testing program for this project consisted of 7 grain size distributions, and classification.

*Table 3: Laboratory Testing Program*

<b>Boring ID / Sample Depth</b>	<b>Test Type</b>	<b>ASTM Designation</b>
B-1 / 4-6'	Grain Size, Classification	D6913, D2487
B-2 / 9-11'		
B-2 / 14-16'		
B-4 / 4-6'		
B-5 / 14-16'		
B-6 / 9-11'		
B-6 / 19-21'		

A summary of the laboratory test results is presented in Appendix C. In general, the laboratory analysis confirmed the visual interpretation of the soil samples. The gravel percentage ranged from 0 to 49.7% and the fines ranges from 0.2 to 78.8%. All samples were determined to be non-plastic.

The samples collected will be stored for 30 days from the date of issue of this report, and then disposed of unless otherwise instructed in writing by the client. All phases of the laboratory testing were performed in general accordance with the applicable ASTM Standards.

## GEOTECHNICAL ANALYSIS

### Settlement Analysis

The borings advanced at the proposed building site encountered layers of medium dense soil (for predominantly coarse sediment) and stiff or very stiff soil (for predominantly fine sediment). Based on our estimates of the current site grades, excavation will be required to install the building and underground storage tank foundations. Settlements under the building are expected to be within the tolerable range for the proposed structure. Our settlement estimate indicates that settlements less than 1/2-inch should be anticipated by end of construction activities and post construction settlements should be negligible.

### Seismic Conditions

Seismic design conditions for this project should utilize a Site Class "D" according to 2009 International Building Code. The IBC Site Class determination is based on the top 100 feet of rock and soil profile. Although the borings performed at the site are much shallower than 100 feet, generalized information of the site and the site conditions suggest this Site Class. Generally, soils most susceptible to liquefaction are saturated, loose sandy soils including granular silts. Soils encountered at the site are not considered to be liquefiable given that the underlying soils are medium dense in nature combined with the non-presence of groundwater at shallow depths. Based on the USGS maps, there are no active faults in the general vicinity of the proposed project. Therefore, liquefaction potential is not anticipated to be an issue for the proposed site.

Based on the subsurface conditions encountered, and the assigned seismic Site Class, the mapped maximum considered earthquake spectral response acceleration parameter at short period and 1-second period for  $F_a$  and  $F_v$ , are 1.6 and 2.4 respectively. The recommended design spectral response acceleration at short periods (SDs) and at 1-second period (SD1), are 0.18g and 0.071g, respectively. The risk of seismically induced settlement or liquefaction for this site is relatively low. Additional seismic design parameters are summarized in the table below.

*Table 4: Seismic Design Parameters*

<b>Site Class: D</b>	
<b>Risk Category: III</b>	
$S_s$ - Acceleration Parameter	0.22 g
$S_1$ - Acceleration Parameter	0.051 g
$F_a$ - Site Coefficient	1.6
$F_v$ - Site Coefficient	2.4

$S_{MS}$ - Adjusted MCE* Spectral response Acceleration Parameter	0.27 g
$S_{M1}$ - Adjusted MCE* Spectral response Acceleration Parameter	0.11 g
$S_{DS}$ - Design Spectral Acceleration Parameter	0.18 g
$S_{D1}$ - Design Spectral Acceleration Parameter	0.071 g

\*Maximum Considered Earthquake

## Foundation Design Recommendations

It is our understanding that the proposed building will house process mechanical equipment including three vertical pressure filters, two PFAS treatment trains, chemical feed and storage areas, an open space for future nitrate treatment, and an underground storage tank below the proposed location of the pressure filters, a control room, an electrical room, a mechanical room, and a restroom. Initial discussions with the structural engineer indicate that the structural slab on grade supporting the pressure filters will be approximately 12 to 18 inches thick, and the underground storage tank will be supported on a mat foundation approximately 24 inches thick. The exterior foundation walls will be 18 inches thick.

For the conventional building foundation, it is our opinion that the proposed pre-engineered metal building may be supported on conventional shallow foundation with slab on grade construction. Based on the standard penetration tests conducted at the site during the subsurface exploration and the estimated bearing capacity, the underlying soils are suitable to carry applied bearing pressures of 2.5 tons per square foot (tsf) for the anticipated footing size without experiencing potential differential settlement in the order of 1/2-inch. The recommended bearing pressure should provide a factor of safety of 3.0 against shear failure.

The foundation of the proposed building should be placed at a minimum depth of 4 feet below the lowest adjacent grade.

The proposed mat foundation for the support of the underground storage tank is expected to be placed on a granular leveling base to promote even distribution. We recommend that the thickness of this layer be 8 inches and be composed of free draining, well graded, non-cohesive fill. Use of fine sand, masonry sand, or recycled concrete is not allowed.

The on-site soil may be reused as fill material across the site and as backfill against foundations. Some reconditioning and moisture adjustment of the excavated soils may become required to achieve the desired degree of compaction. It is our recommendation to excavate and remove any loose fill from existing grade and replace with structural fill to the proposed bottom of foundation elevation. The structural fill should be compacted in thin lifts (6 to 8 inches) such that the entire lifts can achieve a minimum compaction of 95% of the maximum dry density as determined by ASTM D1557. Moisture conditioning within +/- 3% of the optimum moisture content of the soils may be required.

*Table 5: Foundation Design Parameters*

<b>Parameter</b>	<b>Value</b>
Allowable Bearing Capacity	2.5 tsf
Friction Angle	32 °
Unit Weight	115 pounds per cubic foot (pcf)

## CONSTRUCTION CONSIDERATIONS

The foundation areas should be prepared first by removing topsoil, and other unsuitable materials to expose the naturally deposited inorganic sand and gravel. The outer limit of the excavation should be at least 5 feet beyond the outer perimeter of the footing, where possible, without disturbing the foundations of adjacent structures.

Construction of the access road, parking area, and WTP driveway should be able to withstand the loading of chemical delivery trucks and heavy machinery. Access road, parking, and driveway pavement should be constructed with a base layer comprised of 12 inches of compacted processed gravel; 2 inches of hot mix asphalt (HMA) base course; 2 inches of HMA binder course; and 1.5 inches of HMA top course. The base, binder, and top courses for the pavement shall conform to the Massachusetts Highway Department Standard Specifications.

We anticipate that following construction, the underground storage tank be filled and tested for liquid tightness by filling and measuring the loss of water in the tank. ACI 350 and the American Water Works Association recommends maintaining the water level in the tank for a period of 3 days before measuring the water surface for indications of leakage. Horizontal and vertical movement of the tank foundation should be monitored daily during the first filling of the tank.

Temporary construction slopes should be designed and excavated in strict compliance with the rules and regulations of the Occupational Safety and Health Administration (OSHA), 29 CFR, Part 1926.

Groundwater may be encountered in the excavation for the underground wastewater tank. It is anticipated that groundwater and surface water entering the building foundation excavations can be managed to prevent foundation subgrade disturbance using normal diversion trenching and sump pumping.

Foundation bearing soils should not be allowed to freeze before, during, or after foundation construction. In addition, the exposed foundation subgrade should be compacted with a heavy vibratory roller until firm and stable.

All fill placed below foundation bearing levels, as well as over footings, against foundation, and in areas that are designated to be paved, should be structural fill. Structural fill is defined as well graded natural sand and gravel with a maximum particle size of four inches and no more than 10% passing the No. 200 sieve. Structural fill should be placed in 6 to 8-inch loose lifts and compacted to 95% if the Modified Proctor Maximum Dry Density (ASTM D1557) for the specific material being used.

It is recommended that structural fills be constructed as controlled, well-compacted engineered fills. Structural engineered fill should be inorganic, low plastic clay, sand, or gravel. It is recommended that only granular fill be used within the building footprint and within 5 feet of the foundation footprint, where possible. The intent of these recommendations is to reduce the potential for consolidation and settlement of new fills.

Laboratory testing should be performed on the fill materials to determine the appropriate moisture-density relationship of the fill being placed. Adjustments to the soil moisture by wetting or drying should be made as needed during fill placement. During grading operations, representative samples of the proposed imported structural fill materials should be periodically checked via laboratory

testing. A full-time representative from the testing agency should be on site to monitor excavation and grading operation as well as the suitability of fill materials. All finished and disturbed ground surfaces should be adequately prepared to reduce erosion.

*Table 6: Structural Fill Placement Guidelines*

<b>Area</b>	<b>Degree of Compaction Based on ASTM D1557</b>
Below Footings and Slab	95%
Access Road, Parking, and Driveway	95%
Utility Trenches within Building and Pavement Area	95%
Grade-raise Fill Placed within 1 foot of the Base of the Pavement	95%
Granular Cushion Beneath Floor Slab and over Footings	95%
Structural Fill Supporting Footing	95%
Other Landscape Areas	92%

Crushed stone shall consist of durable crushed rock or durable crushed gravel stone, free from ice and snow, sand, clay, loam, or other deleterious or organic material. The crushed stone shall be uniformly blended and shall conform to the following requirements.

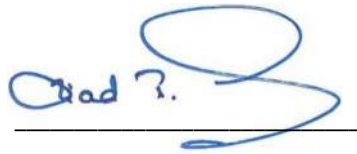

Table 7: Crushed Stone Guidelines

Percent Passing by Weight		
Sieve Size	¾ inch Stone*	½ inch Stone
1 inch	75 – 100	-
¾ Inch	0-5	-
5/8 Inch	-	100
½ Inch	-	85-100

No. 8	-	0-15

## LIMITATIONS

This report has been prepared in accordance with generally accepted geotechnical engineering practices and it is intended to be used to assist in the design of the new water treatment plant. The findings and recommendations contained in this report are based on site conditions encountered during the subsurface exploration in February 2023. These opinions were arrived at in accordance with accepted engineering procedures at this time. Conclusions and additions made from these data by others are their responsibilities. Should the location of the proposed building change, or if the soil conditions become notably different during construction from those described herein, Environmental Partners should be notified immediately. Should potentially hazardous materials be encountered at the site during excavation, an environmental investigation should be performed immediately.

Facility to Treat > 1MGD  
Record #24-WS24-0001-APP

Dear Mr. Hooper:

The Southeast Regional Office of the Massachusetts Department of Environmental Protection (MassDEP), Drinking Water Program, is in receipt of plans and specifications for the installation of a Greensandplus™ filtration system and a per- and polyfluoroalkyl substances (PFAS) removal system at the proposed Water Treatment Facility at 15 Tree Lane in the Town Sharon, Massachusetts.

Please find attached MassDEP approval of the proposed Water Treatment Facility in the Town of Sharon, MA.

Please note that the signature on this cover letter indicates formal issuance of the attached document. If you have any questions regarding this document, please contact Giliane Tardieu at (508) 946-2789 or [Giliane.tardieu@mass.gov](mailto:Giliane.tardieu@mass.gov).

Sincerely,

Jim McLaughlin, Chief  
Drinking Water Program  
Bureau of Water Resources

BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

The Southeast Regional Office of the Department of Environmental Protection, Drinking Water Program (“the Department”), is in receipt of plans and specifications for the Construction of a new Water Treatment Plant in the Town of Sharon, Massachusetts. The plans and specifications, submitted on behalf of the Sharon Water Department (“the PWS”) by Environmental Partners of Quincy, Massachusetts, were received by the Department on February 29, 2024, and bear the seal and signature of Alston Potts, a Massachusetts Registered Professional Engineer, P.E. No.56074 (“the Engineer”).

Specific documents relative to this proposal received and reviewed by the Department for conformance with the Department’s Water Supply Regulations, 310 CMR 22.00 (Regulations) and “Guidelines and Policies for Public Water Systems” (Guidelines) are as follows:

- Water Supply Certification Form.
- Cover Letter, Checklists for KOH, NaOH, NaOCl, and NaF.
- Project Specifications, Volume 1 and 2.
- Project Plans, Volume 1 and 2.

**BACKGROUND:** The work includes the construction of the Wells 2, 3, and 4 Water Treatment Plant, and modifications to the existing Well Stations. Well 2 (Department Source ID 4266000-01G) is a 9-well wellfield, while Well 3 (4266000-02G) and Well 4 (4266000-03G) are individual wells. Currently, water from each well is treated at its respective pumping station. Treatment consists of sodium hypochlorite for disinfection, potassium hydroxide for pH adjustment and sodium fluoride for dental health. On June 25, 2021, the Department approved the activation of temporary, portable, ion exchange treatment of Well 4 to remove per- and polyfluoroalkyl substances (PFAS). Well 2 also has had PFAS levels exceeding the Massachusetts Maximum Contaminant Level (MMCL), and Well 3 PFAS levels are significant. The PWS made the decision to build a single treatment plant to treat the flows from all three wells. Two pilot studies were performed in parallel to evaluate the use of pressure filtration technology for the removal of iron and manganese from Well 2. The first pilot study evaluated the oxidation and subsequent filtration of iron and manganese using two different adsorptive media: GreensandPlus™ (Greensand) and Pureflow© PM-200 pyrolusite media. The second pilot study evaluated the filtration of iron and manganese using biologically activated media. On September 15, 2023, the Department approved the pilot study report for the use of GreensandPlus™ filtration (Record No. 23-WS22-0024-APP).

The proposed Water Treatment Plant will include a pre-fabricated metal building system; chemical storage tanks; chemical feed systems; bag filtration; iron and manganese filtration system; PFAS treatment system; air scour blower; backwash waste tank with supernatant recycling equipment; finished water wet well; recycle, backwash waste, sludge, and finished water pumps; associated structural, architectural, process piping, instrumentation and controls, plumbing, fire protection, HVAC, and electrical work. Modifications to Well Stations 2, 3, and 4 include selective demolition of chemical feed systems; instrumentation and controls; and replacement of process mechanical equipment, pumps, piping, and appurtenances. There will no longer be chemical addition at the individual well stations following project completion.

The discharge lines from Wells 2 and 3 will be manifolded and sodium hypochlorite injected into a common line as an oxidant to feed three parallel greensand pressure filtration vessels for iron and manganese removal. Sodium bisulfite for dechlorination is injected in the common line effluent from the greensand filters. The effluent from the greensand filters and the discharge from Well 4 will be manifolded, flow through three (3) parallel bag filters, and feed the PFAS removal system. Potassium

Sharon Water Department  
 Sharon, Massachusetts  
 PWS ID#4266000  
 BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
 Record #24-WS24-0001-APP

hydroxide for pH adjustment shall be injected ahead of the PFAS filtration system in the common line of Well 4 raw water and the effluent line from the greensand filters. The effluent from the PFAS treatment system is treated with sodium hypochlorite before entering the finished water wet well located in the lower level of the Treatment Plant. Three finished water pumps convey the water to the distribution system. The finished water also supplies backwash water to the greensand filter system and the PFAS removal system.

WELLS 2 AND 3 REDEVELOPMENT

The wells will be redeveloped using chemical and mechanical cleaning. The maximum withdrawal rates of the wells shall be determined. Drawdown measurements shall be taken and recorded during the well capacity evaluation and redevelopment. A vertical turbine pump will be installed at Well Station 3. Well 2 raw water pumps shall be multi-stage in-line vertical pumps. A vacuum priming system shall be provided for the Well Station 2 Raw Water Pumps. Variable frequency drives will be installed for the pumps.

Feed System	Number of Pumps	Pump Type	Capacity (gpm)	Motor Size (HP)
Well Station 2	2	Multi- Stage in-line Vertical	326 gpm @ 306 ft TDH	50
Well Station 3	1	Vertical Turbine	264 gpm @ 311 ft TDH	40

IRON AND MANGANESE REMOVAL SYSTEM

The vertical Greensandplus™ filtration system will have the following characteristics:

Maximum Design Flow Rate	590 gpm
Average System Design Flow Rate (typical operation)	500 gpm
Unit design flow rate with all units in service (typical operations)	167 gpm
Unit design flow rate with one unit out of service	250 gpm
Filter loading rate with all units in service (typical operations)	4.33 gpm/ft <sup>2</sup>
Filter loading rate with one unit out of service	6.5 gpm/ft <sup>2</sup>
Maximum allowable filter loading rate	8 gpm/ft <sup>2</sup>
Normal maximum operating pressure:	100 psi
Influent water quality (Historic Worst)	Iron :1.78 mg/L; Manganese: 0.240 mg/L

The filter backwash water source shall be finished water from the distribution system. The vertical pressure filters will measure 7-foot O.D. by 63- inch straight shell height. The filter tanks shall be of welded steel construction using SA-516 Grade 70 steel and shall be tested to withstand a hydrostatic pressure thirty (30) percent more than the designed working pressure of 100 psi. Each tank shall include the following features:

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

- One (1) 18-inch diameter manway with davit and a spare gasket.
- One (1) 14-inch x 18-inch manway with spare gasket.
- Flange pad or nozzle type connections as shown on the Contract Drawings.
- Four (4) lifting lugs.
- Four (4) structural steel I-beam type support legs.

Each filter shall have a hub-lateral type inlet distributor/backwash collector system furnished and installed. The hub shall extend down from the tank top head and include two (2) lateral arms, each ending with two (2) upturned elbows. Filter inlet distribution system shall be designed to allow 40% expansion of the filter bed.

Each filter tank shall be furnished and installed with an air scour distributor of stainless-steel construction. Each distributor shall consist of a 2-inch stainless steel manifold with 3/8-inch slotted stainless steel threaded and capped laterals on 7.5-inch maximum centers. The air scour distributor shall be firmly supported from the gravel retaining screen using a 1-inch stainless steel support pipe and stainless-steel U-bolts. Each lateral shall have a series slotted openings by first milling a longitudinal slot every 3.5 inches, approximately one (1) inch long and 1/50th of an inch in width, two thirds (2/3) of the way through the side wall of the 1/2-inch lateral. An orifice 1/8 inch long and slightly less than 1/50th of an inch in width shall be punched through the remainder of the side wall. The end of each lateral shall receive one 1/16" diameter hole as low as possible in the cap.

The gravel retaining screen assembly prevents the possibility of gravel bed upset and must be included. Each filter tank shall have a gravel retaining screen assembly consisting of all necessary 2-inch Type 304 stainless steel angles.

Each filter tank shall be furnished and installed with a nonferrous underdrain system designed to uniformly distribute backwash water and for collection of filtered water. The distributor shall be of polypropylene construction.

A gravel support bed shall be incorporated in the bottom of each filter tank, consisting of five (5) layers of graded gravel, with the largest size gravel loaded into the filter first and the succeeding smaller sizes placed on top.

Each filter shall be provided with GreensandPlus™ filter media manufactured by Inversand Company to form an 18-inch bed depth. In addition to the GreensandPlus™ filter media, the Filter Manufacturer shall provide specially graded anthracite to form an 18-inch bed depth. The GreensandPlus™ media and anthracite bed depth shall total 36-inches. All filter media shall be accepted under NSF Standard 61.

A differential pressure transmitter shall be installed for each filter. A pressure gauge shall be installed for each filter inlet and outlet.

Each filter shall be equipped with an electromagnetic flow meter suitable for fixed-site measurement of bi-directional flow in a full pipe. The filtration system shall be controlled via the Main Control Panel.

#### PFAS Removal System

The PFAS removal system shall be a vertical pressure-type PFAS removal system for operation in series. The removal system shall be specifically designed to provide filtration and treatment for PFAS removal

Sharon Water Department  
 Sharon, Massachusetts  
 PWS ID#4266000  
 BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
 Record #24-WS24-0001-APP

and shall operate in a lead-lag configuration. The vessel media shall consist of granular activated carbon in the lead vessel and ion exchange resin in the lag vessel. Potassium hydroxide for pH adjustment and sodium bisulfite for dechlorination shall be fed ahead of the filtration system.

There will be three (3) identical systems operating in parallel. Each system shall include two (2) identical pressure vessels, (1) piping and valve manifold, and interconnecting piping. Each system shall meet the following requirements:

- Vessel Diameter: 10-feet.
- Maximum System Flow Rate: 520 gpm.
- Minimum System Flow Rate: 390 gpm.
- Lead Vessel Media: GAC
  - o GAC Minimum EBCT: 10 minutes.
- Lag Vessel Media: ion exchange.
  - o Ion Exchange Minimum EBCT: 3 minutes.

The pressure vessel systems shall be designed to treat the raw water with the following typical characteristics:

Parameter	Influent
pH	8.0-8.2
Temperature	50-55°F
PFAS6 (ppt)	43.2-81.4

Effluent Water Quality Requirements:

Parameter	Effluent
PFAS6	ND
GAC Minimum Bed Volumes Treated*	40,000
IX Minimum Bed Volumes Treated*	120,000
pH	8.0-8.2

\*Minimum bed volumes treated per vessel, per batch of media

The PFAS removal system will have the following design characteristics:

Maximum clean bed headloss at maximum system flow rate through the pressure vessel system	20psi
Maximum system operating pressure	75 psi
Maximum height of pressure vessel and influent piping	22'-6"
Maximum footprint of pressure vessel system	31'-4" long by 12'-9" wide

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

The pressure vessels shall be fabricated of carbon steel, conforming to ASTM A516 grade 70, approximately 10' diameter with elliptical top and bottom heads. The straight side height of each vessel shall be sized to contain:

- Approximately 700 cubic feet of GAC (as specified in Section 11203) and to accommodate approximately 30% bed expansion at 50°F with one foot of freeboard within the straight side of the vessel using GAC.
- and approximately 240 cubic feet of IX resin.

Each vessel shall be designed and furnished with an underdrain system that provides uniform distribution of the treated water, facilitates GAC removal without the need to open a manway, and allows the replacement of the underdrain without the need to remove external piping. The underdrain system shall be designed to contain the media within the vessel and be constructed of stainless steel. The underdrain system provided shall be compatible with both GAC media and ion exchange resin.

Each vessel shall include the following features:

- Two (2) 14" x 18" elliptical diameter manways with a spare gasket.
- One (1) 20" diameter manway with a spare gasket (with a davit).
- Flange pad or nozzle type connections.
- Four (4) lifting lugs.
- Four (4) structural steel I-beam type support legs.
- Four (4) sample ports.

The sample ports shall be located above the underdrain system to provide water level indication during initial water fill before media loading and to provide tracking of PFAS6 breakthrough through the vessel bed during normal operations. Each of the sample ports shall be connected to a ½" diameter vertical stainless-steel pipe with the stainless-steel ball valve at the end, installed approximately five (5) feet above ground level. The sample ports locations shall correspond with the following GAC media depths (applies to both GAC and IX treatment vessels):

- 100% bed depth (top of bed).
- 75% bed depth.
- 50% bed depth.
- 25% bed depth.

Media fill and discharge lines shall be fitted with hose connections, such that media transfer to and from the vessels can be facilitated using media transfer hoses. These connectors shall be 4" Quick Disconnect Adapters constructed of aluminum. Two (2) flush connections shall be provided on each media fill line, one upstream and one downstream of the fill valve. One (1) flush connection shall be provided on each media discharge line, downstream of the discharge valve.

The influent and effluent pipe for each vessel shall be provided with an NSF-61 approved reinforced rubber expansion joint that allows 4-way movement and 30° angular misalignment.

#### GRANULAR ACTIVATED CARBON (GAC) MEDIA

The GAC shall be made from selected grades of bituminous or sub-bituminous coal capable of withstanding repeated backwash procedures without significant change in physical sizes and shall be suitable for reactivation and re-use. Only coal-based GAC with MassDEP New Technology Approval for PFAS removal will be acceptable.

Sharon Water Department  
 Sharon, Massachusetts  
 PWS ID#4266000  
 BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
 Record #24-WS24-0001-APP

The PFAS Filter Manufacturer shall conduct a small-scale pilot study at Well Station 4 using shortened GAC media beds to confirm it can meet or exceed the bed life (number of treated water bed volumes) required herein.

A minimum 700 cubic feet of GAC media shall be provided per pressure vessel. The final volume per vessel shall depend on the results of the small-scale pilot study. The GAC media will be chosen from the following list:

- Calgon Carbon, Filtrasorb 400 AR+ PH, approved on 5/6/2022.
- Evoqua Water Technologies, 1240 AWLD, approved 3/16/2021.
- Carbon Activation Corporation, Norit GAC 400, approved 5/17/2022.

ION EXCHANGE (IX) RESIN

The IX shall be styrene-based polymer resin capable of removing per- and polyfluoroalkyl (PFAS) compounds in water treatment processes. Only buffered type IX with MassDEP New Technology Approval for PFAS removal will be acceptable.

The PFAS Filter Manufacturer shall conduct a small-scale pilot study at Well Station 4 using shortened IX media beds to confirm it can meet or exceed the bed life (number of treated water bed volumes) required herein.

A minimum 240 cubic feet of IX media shall be provided per pressure vessel. The final volume per vessel shall depend on the results of the small-scale pilot study. The ion exchange media will be chosen from the following list:

- Purolite, Purofine PFA694EBF, approved 11/4/2021.
- Calgon, CALRES 2301(buffered option), approved 10/15/2019.
- Dow Chemical Company, DOWEX PSR-2 Plus, approved 3/26/2019.

CHEMICAL FEED SYSTEMS

Four chemical feed systems are included in the treatment process: potassium hydroxide, sodium hypochlorite (pre-filtration and post filtration), sodium bisulfite, and sodium fluoride. Each chemical feed system includes redundant chemical feed pumps, day tank, bulk storage tank and transfer pumps for filling day tanks. Potential chemical spillage is contained within the chemical feed area. Each chemical feed system has its own containment area.

The electric solenoid diaphragm chemical metering pumps shall be positive displacement type metering pumps. The pumps shall be fully compatible with the chemicals being pumped. Metering pump shall be capable of dividing or multiplying pulse inputs from 1 to 999 or responding directly or inversely to a 4-20mA input signal. Design criteria for the pumps are listed in the following table:

Feed System	Number of Pumps	Max. Feed Rate (GPH)	Min. Feed Rate (GPH)	Max. Injection Pressure (PSI)	Liquid End Construction
KOH	2	5.37	1.67	65	316 SS
Pre-filtration NaOCl	2	1.32	0.30	75	PVC

Sharon Water Department  
 Sharon, Massachusetts  
 PWS ID#4266000  
 BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
 Record #24-WS24-0001-APP

Feed System	Number of Pumps	Max. Feed Rate (GPH)	Min. Feed Rate (GPH)	Max. Injection Pressure (PSI)	Liquid End Construction
Post-filtration NaOCl	2	1.23	0.40	25	PVC
NaHSO3	2	0.38	0.008	65	PVC
NaF	1	3.72	1.16	64	PVC

Metering pumps shall be supplied with a four-function valve capable of providing positive anti-siphon, back pressure, priming aid – line pressure release, and pressure relief. Sodium Hypochlorite metering pumps shall be supplied with a four-function valve with automatic priming to allow for constant removal of gas and vapors in the line.

Each metering pump shall be supplied with external cables for start/stop control and 4- 20 mA control. If required, an analog to digital converter shall be provided.

Sodium Fluoride (NaF) is added for fluoridation. The chemical solution is prepared on a continuous basis by potable water flowing through a bed of fluoride and dissolving the fluoride to saturation concentration within a fluoride saturator. NAF shall be stored in a 55-gallon saturator tank and shall include an overflow assembly. The saturator and overflow assembly shall be provided with a solenoid valve, float switch, and mechanical float shutoff valve to facilitate automatic operation of the fluoride saturator. The float switch shall be located within the saturator and shall be connected to the solenoid valve, which controls potable water flow into the saturator. Flow into the saturator is initiated when the tank level drops and the float switch signals for the solenoid valve to open. Flow into the saturator shall continue until the float switch returns to the manufacturer-specified level, at which point the float switch shall signal for the solenoid valve to close. A disc water meter indicates the process water flow rate locally.

Pressure Gauges: Each chemical feed system shall be supplied with a pressure gauge for reading discharge pressure.

Metering pumps shall be provided with a freestanding mounting system consisting of a FRP framing system and mounting board. The freestanding mounting system shall have a minimum of four support legs.

The chemical transfer pumps shall be magnetic drive centrifugal transfer pumps. The pumps shall be fully compatible with the chemicals being pumped. One (1) magnetic drive centrifugal transfer pump shall be supplied for the following chemical feed systems: potassium hydroxide, pre-filtration sodium hypochlorite, post filtration sodium hypochlorite, sodium bisulfite. The plastic body chemical pumps 3 HP or less shall have horizontal, heavy-duty, TEFC electric motor, suitable for 460-volt, 3-phase, 60-Hz AC power supply. Motors shall be chemical mill duty rated with corrosion resistance.

Feed System	Number of Pumps	Design Capacity (gpm)	Pump Design Head (ft)	Min. Motor Size (hp)	Max. Motor Speed (rpm)	Shut-Off Head (ft)
KOH	1	50	25	1	3450	33
Pre-filtration NaOCl	1	27	13.8	1/2	3450	21
Post-filtration NaOCl	1	23	11	1/2	3450	21
NaHSO3	1	23	11	1/2	3450	21

 BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
 Record #24-WS24-0001-APP

A spring-loaded switch will be provided for chemical transfer pump operation. When switch is turned clockwise, the pump shall energize and shall return left to the OFF position once the switch is released. The transfer pump control switch shall be installed on the metering pump table backer board, within sight of the transfer pump and the day tank.

**CHEMICAL STORAGE TANK SCHEDULE**

Equipment	Capacity (gal)	Material
Potassium Hydroxide Bulk Storage Tank	3,000	HDXLPE
Sodium Hypochlorite Bulk Storage Tank	905	HDXLPE
Sodium Bisulfite Bulk Storage Tank	1,150	HDXLPE
Potassium Hydroxide Day Tank	230	HDXLPE
Sodium Hypochlorite Day Tank ( Pre-filtration)	70	HDXLPE
Sodium Hypochlorite Day Tank ( Post-filtration)	30	HDXLPE
Sodium Bisulfite Day Tank	30	HDXLPE
Fluoride Saturator	55	PE

**PROCESS PUMPS**

Feed System	Number of Pumps	Pump Type	Capacity (gpm)	Motor Size (HP)
Sludge Pumps	2	Multi- Stage in-line Vertical	50 gpm @ 24 ft TDH	1.5
Recycle Pumps	2	Multi- Stage in-line Vertical	30 gpm @ 254 ft TDH	5
Finished Water Pumps	3	Multi- Stage in-line Vertical	660 gpm @ 232 psi	50

## PROCESS CONTROL AND INSTRUMENTATION

The Town of Sharon has standardized their PLC system on Allen-Bradley CompactLogix™ 5380 Programmable Logic Controllers. The PLC shall be capable of stand-alone operation in the event of SCADA network or SCADA computer failure. Operator interface terminals (OIT) shall be Allen-Bradley Panel View Plus 7 Performance.

Electromagnetic flow meters and flow switches shall be installed. All electromagnetic flow meters shall be Badger, the Town of Sharon has standardized on this electromagnetic flow meter. No exceptions shall be allowed. One flow switch shall be installed on the feed line to each emergency shower, which shall be used to indicate emergency shower usage.

Pressure indicating transmitters and differential pressure indicating transmitters shall be installed.

Ultrasonic Level Transducers and Transmitters, Flood/Float Switches, Level Transducers shall be installed.

Each sample stream shall have a single analyzer assembly, pH, temperature, chlorine residuals will be monitored.

### Chemical Feed Metering Pumps

The KOH, NaOCl, NaHSO<sub>3</sub>, and NaF metering pumps shall be supplied with a pre-designed chemical feed interlock receptacle which shall include an HOA switch, emergency stop pushbutton, twist lock plug receptacle, integral lock-out timer, and local indicator light during Hand Operation. Any WTP equipment de-energized by an interlock shall be reset at the WTP MCP. Remote resetting of interlock conditions shall not be permitted.

**PRE-FILTRATION NaOCl FEED PUMP:** Pre-filtration NaOCl feed shall be paced based on the treatment plant water flow rate as measured by the Wells 2 & 3 raw and recycle flow meter. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the pre-filtration pump shall be selected by an H-O-A selector switch located on the pre-filtration NaOCl Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the Wells 2 & 3 raw and recycle flow meter shall shut down the pre-filtration chemical feed pump.

**POST-FILTRATION NaOCl FEED PUMP:** Post-filtration NaOCl feed shall be paced based on the combined PFAS filters effluent flow rate. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the post-filtration pump shall be selected by an H-O-A selector switch for disinfection located on the post-filtration NaOCl Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition at the filtered water flow meter shall shut down the post-filtration chemical feed pump. When operating the

Sharon Water Department

Record #24-WS24-0001-APP

pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panels. Selection of “HAND” can only be performed at the Metering Pump Control Panel via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

**KOH FEED PUMP:** KOH feed shall be paced based on the Wells 2, 3, and 4 combined flow rate as measured by the PFAS Treatment Influent flow meter. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the metering pump shall be selected by an H-O-A selector switch for pH control located on the KOH Metering Pumps Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the PFAS Treatment Influent flow meter shall shut down the chemical feed metering pumps. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of “HAND” can only be performed at the KOH Metering Pump Control Panel via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

**SODIUM BISULFITE METERING PUMPS:** Sodium bisulfite feed shall be paced based on the Fe/Mn filter effluent flow rate. The chemical feed pumps are equipped with integral mode start/stop controls. Automatic or Manual control of the metering pump shall be selected by an H-O-A selector switch for pH control located on the sodium bisulfite Metering Pump Control Panels. The pumps can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panels H-O-A switch. The pump motor speed can be set manually by integral pump controls or remotely by the SCADA system. A no-flow condition as measured by the Fe/Mn filter effluent flow meter shall shut down the chemical feed metering pumps. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select “HAND” position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. “Pump in Hand” shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of “HAND” can only be performed at the KOH Metering Pump Control Panel via the selector switch, and “HAND” operation of the metering pumps cannot be completed in the SCADA system. In the “OFF” position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

**SODIUM FLUORIDE (NaF) CHEMICAL METERING PUMP:** NAF feed shall be paced based on the treatment plant water flow rate as measured by the combined PFAS filters effluent water flow meter. The chemical feed pump is equipped with integral mode start/stop controls. Automatic or Manual control of

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

the metering pump shall be selected by an H-O-A selector switch located on the NAF Metering Pump Control Panel. The pump can be operated via the SCADA system (direct 4-20 mA signal) or manually using the integral pump controls and the Metering Pump Control Panel H-O-A switch. A no-flow condition as measured by the combined PFAS filtered water flow meter shall shut down the chemical feed metering pump. When the metering pump is in "AUTO" mode, it is controlled and operated via the SCADA system. When operating the pump in the manual mode (maintenance/service, calibration, etc.), the operator shall select "HAND" position on the Metering Pump Control Panel, which shall begin a timer in the Metering Pump Control Panel. The timer duration is operator selectable up to a maximum of 10 minutes, after which time the metering pump shall be de-energized. "Pump in Hand" shall be an alarm condition in SCADA and at the Metering Pump Control Panel. Selection of "HAND" can only be performed at the NAF Metering Pump Control Panel via the selector switch, and "HAND" operation of the metering pump cannot be completed in the SCADA system. In the "OFF" position the metering pump shall not run. A metering pump fault shall be reported in the SCADA system.

### Analyzers

**WELLS 2 & 3 RAW & RECYCLE WATER:** A combined pH and temperature analyzer shall measure pH and temperature of the Wells 2 & 3 raw & recycle water. High and low pH alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable.

**OXIDIZED WATER:** A combined chlorine residual, pH, and temperature analyzer shall measure chlorine residual, pH, and temperature of the oxidized water. High, high-high, low, and low-low chlorine residual alarm conditions shall be reported in the SCADA system. High and low pH alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. In the event of a high-high or low-low oxidized chlorine residual, the SCADA system shall de-energize the Well 2 Pumps and Well 3 Pump.

**FE/MN FILTERED WATER:** A combined chlorine residual, pH, and temperature analyzer shall measure chlorine residual, pH, and temperature of the Fe/Mn filtered water. High and low pH and chlorine alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable.

**PFAS FILTER INFLUENT WATER:** A combined chlorine residual, pH, and temperature analyzer shall measure chlorine residual, pH, and temperature of the PFAS influent water. Alarm conditions for pH and chlorine shall be reported in the SCADA system. Low-low or high-high pH alarm conditions (operator selectable setpoint) shall turn off Well 2 Pumps, Well 3 Pump and Well 4 Pump, and an alarm shall be reported in the SCADA system. A high-high chlorine alarm condition (operator selectable setpoint) shall turn-off Well 2 Pumps and Well 3 Pump, and alarm shall be reported in the SCADA system. The alarm set points shall be operator selectable.

**FINISHED WATER:** A combined chlorine residual, pH, and temperature analyzer shall measure chlorine residual, pH, and temperature of the finished water. Alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. Low-low or high-high finished water pH shall turn-off Well 2 Pumps, Well 3 Pump, Well 4 Pump and Finished Water Pumps, and an alarm shall be reported in the SCADA system. Low-low or high-high finished water chlorine reading shall turn off Well

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

2 Pumps, Well 3 Pump, Well 4 Pump and Finished Water Pumps, and an alarm shall be reported in the SCADA system.

FINISHED WATER (100-ft sample Tap): A combined chlorine residual, pH, and temperature analyzer shall be used to measure chlorine residual, pH, and temperature of the 100-ft sample tap water. Alarm conditions shall be reported in the SCADA system. The alarm set points shall be operator selectable. Low-low or high-high 100-ft sample tap water pH shall turn off Well 2 Pumps, Well 3 Pump, Well 4 Pump and Finished Water Pumps, and an alarm shall be reported in the SCADA system. Low-low or high-high 100-ft sample tap water chlorine reading shall turn off Well 2 Pumps, Well 3 Pump, Well 4 Pump, and Finished Water Pumps, and an alarm shall be reported in the SCADA system.

Any well station equipment de-energized by an interlock shall be reset at the respective well station control panel. Remote resetting of interlock conditions shall not be permitted.

The SCADA software to be furnished and installed for the WTP shall be integrated with and work in harmony with the Town's existing SCADA systems associated with existing site facilities and off-site or remote facilities.

FINISHED WATER WET WELL; Sodium hypochlorite and sodium fluoride feed systems shall provide chemical treatment for finished water chlorine residual and dental health, respectively, to meet finished water quality goals. Finished water shall flow through one of two redundant pressure sustaining valves before entering the finished water wet well, which is approximately 23 feet wide by 47 feet long. Two of three 60-horsepower vertical in-line pumps shall pump finished water from the FWW through a 12-inch ductile iron main on Tree Lane. A level indicating transmitter shall measure water level in the FWW. High- and low-level float switches shall provide interlock controls of the well pumps and finished water pumps. The finished water pumps shall operate based on the water level in the Upland Road Storage Tank. A 12-inch ductile iron overflow pipe shall convey finished water to a bioretention basin southwest of the WTP. The overflow shall include a duckbill check valve for backflow prevention. The finished water wet well shall act as a break tank to reduce pressures through WTP. The finished water wet well shall not provide 4-log inactivation of viruses.

BACKWASH WASTE TANK: Filter backwash waste (backwash waste and filter to waste) from backwashed Fe/Mn filters and PFAS filters is directed to the Backwash Waste Tank (BWWT) located in the WTP lower floor. The WTP water quality analyzer flows shall also discharge by gravity into the BWWT. Each Compartment shall have a dedicated inlet pipe with a manual isolation butterfly valve to allow the Town to select the compartment that backwash waste shall enter. The tank floor shall slope towards a sump adjacent to the Water Treatment Plant access driveway for sludge collection. A 12-inch ductile iron overflow pipe shall convey backwash waste to a bioretention basin northeast of the Water Treatment Plant. The overflow shall include a duckbill check valve for backflow prevention. The operator shall select the "ONLINE" BWWT compartment for automatic operation in the SCADA system via the MCP OIT or the SCADA Server. Each backwash compartment shall be equipped with an ultrasonic transmitter (LIT-811A, LIT-811B, LIT-811C) to monitor the liquid level in the tank, which shall report a high and low alarm (operator selectable) in the SCADA system. Each backwash waste tank compartment shall be outfitted with a floating decanter. The decanters shall be manifolded and convey

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

settled backwash water to the recycle pump suction header in the pipe gallery. One of two recycle pumps shall deliver recycle water to the Well 2 and 3 raw water pipe where an electromagnetic flow meter measures the recycle water flow rate. The recycle flow shall not exceed 5% of the Wells 2 and 3 raw water flow. The sludge will be removed through a truck connection. The overflow from the backwash waste tank will flow to the stormwater infiltration basin.

Security alarm system and fire alarm system will be installed.

A natural gas fired engine driven generator with sound attenuated weatherproof enclosures will be installed at the site. The alternating current generator will be 350 kW, three (3) Phase, 60 Hertz, 277/480 Volts, 4 wire. The generator engine shall have a unit mounted radiator water cooled.

Ductile iron pipes shall be installed as part of the project. All ductile iron pipes shall conform to ANSI A21.50 (1976) (AWWA C150) and ANSI A21.51 (AWWA C151). The ductile iron pipe shall be Class 52 and furnished in nominal 18-foot lengths, with Push-on or Mechanical Joints. The ductile iron pipe shall be double cement-mortar lined inside coating in accordance with AWWA C104 ANSI A21.4, latest edition. All ductile iron pipe shall have a bituminous outside coating in accordance with AWWA C151, latest edition. Prior to pressure and leakage tests, the piping shall be thoroughly flushed clean of all dirt, dust, oil, grease and other foreign materials in accordance with AWWA C651. A service shall be brought to each developed parcel of property along the water main route. Corporation cocks shall be installed for connecting all service to the new water mains. All existing services shall be maintained until the new service connections have been fully installed, chlorinated and tested. Unless otherwise specified, all pipe for services up to 2-inch diameter shall be copper tubing Type K, conforming to ASTM B88.

## APPROVAL CONDITIONS

Pursuant to the Department's authority under 310 CMR 22.04(7) to require that each supplier of water operate and maintain its system in a manner that ensures the delivery of safe drinking water to consumers, this approval is made subject to the following conditions:

1. All submittals required by this approval shall be directed to the Department's Southeast Regional Office Drinking Water Program unless otherwise specified. All submittals required by this approval shall reference the date of this approval letter and Record #24-WS24-0001-APP.
2. The PWS shall notify the Department, in writing, thirty (30) days prior to the completion of the facility modifications so that a final inspection can be conducted. The PWS shall not place the subject facility into service until such time as the Department conducts its final inspection of the completed treatment works and approves the use of the described facility in writing.
3. Construction shall be completed in strict accordance with the submitted plans. Any changes made to the submitted plans or specifications affecting the capacity, hydraulic conditions, operating units, functioning of water treatment processes or quality of water to be delivered, shall receive prior written approval of the Department's Southeast Regional Office Drinking Water Program.
4. The media used in the PFAS removal vessels shall be GAC in the lead vessel and an anionic resin in the lag vessel. The PWS shall adhere to the Manufacturer's requirements and the requirements contained in the Department's New Technology Approval.

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

5. All sample taps within the treatment facility shall be a smooth-nosed style. No threads shall be on any sample tap.
6. The PWS shall update its Emergency Response Plan to incorporate the new facilities.
7. The PWS shall update its asset management plan, inventory, maintenance plan, and budget to include the new facilities.
8. The PWS shall, minimally, complete the EPA's "10 Questions for a Cybersecurity Dialogue with a Utility." The results shall not be submitted to the Department. The engineer shall certify that the work was done and the completed work shall be shown during the final inspection.
9. No later than sixty (60) days following the date of the Department's written approval to activate the modified facility, the PWS shall engage a third party to conduct a cybersecurity assessment. Free cybersecurity assessments are available from EPA. The PWS will receive an assessment report following completion of the assessment. Do not email or share the report with anyone. Contact the Department upon receipt of the assessment report and the Department will arrange to conduct an onsite review of the report.
10. All chemical tanks, carry pipes, and chemical injection locations shall be labeled in accordance with the Department's Guidelines And Policies for Public Water Systems ("*Guidelines*"). The bulk fill station shall be labeled with the chemical name, chemical formula, and 4-digit UN number.
11. Bulk and day chemical storage tank vents shall vent individually to the exterior of the facility. Bulk tanks shall not feed directly to a chemical feed pump, and no connection from a bulk tank shall bypass the day tank.
12. The PWS shall post an emergency contingency planning sheet in a readily visible part of the treatment facility as required and specified at *Guidelines* sections 7.2.9 and 12.1.1.
13. The PWS shall maintain the pH of the finished water (point of distribution system entry) at a level consistent with their corrosion control strategy. The Department will require full rounds of semiannual monitoring under the Lead and Copper Rule after granting final approval of the modified treatment facilities to go online. Please submit a new LCR sampling plan for approval at least thirty (30) days prior to anticipated activation of the water treatment plant.
14. The PWS shall, at a minimum, monitor and record the pH levels and chlorine residual levels of water entering the distribution system from the treatment facilities daily. The results shall be entered on the required water treatment reporting forms. Daily readings are being required in order to validate the accuracy of the continuous pH and chlorine residual monitoring equipment.
15. The PWS must establish its applicable Optimum Water Quality Parameters (OWQP) to comply with the Lead and Copper Rule (LCR) (310 CMR 22.06B). To accomplish this, the PWS will need to collect water quality samples from the finished water sample line, all other entry points (i.e., sample the source water; post-treatment if treatment is used), and from sites in the distribution system which represent water quality throughout the distribution system (e.g., coliform sampling sites). Water quality data shall be reported to the Department on Form LCR-WQA. Please contact

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

Nicholas Shuler of the Southeast Regional Office at 617-418-0444 to verify the OWQP sampling protocol.

16. Instrumentation, monitoring equipment, and alarm systems must be properly maintained and calibrated at all times. Separate calibration logs for each instrument/monitor must be maintained.
17. Water Treatment Chemicals:
  - a) The PWS shall ensure that chemicals which may come in contact with the water or affect the quality of the water, are certified to be in conformance with ANSI/NSF Standard 60 or meet the food grade standards of the United States Pharmacopeia. Each chemical barrel delivered from the manufacturer must bear the NSF seal.
  - b) A properly certified operator shall be present when any deliveries of chemicals are made. Handling and storage of any chemical shall conform to the *Guidelines*. Chemical delivery procedures shall be posted at the facility.
  - c) The facility shall be equipped with appropriate quantities of personal protection equipment as directed by Safety Data Sheets (SDS) for the chemicals used on site. Such equipment shall include, but not be limited to, safety goggles, face shields, chemical aprons, chemical resistant gloves, hearing protection, fire extinguishers, litmus paper, first aid kit, etc. All staff working at the facility shall be trained in the use and proper application of the safety equipment. A copy of the SDS for each chemical used or stored shall be available at all times at the treatment facility.
  - d) The PWS shall have available appropriate laboratory equipment to monitor chlorine and pH. The equipment shall be on hand at the time of the final inspection.
  - e) The PWS shall report to the Department the amount of all chemicals introduced to the subject water supply in accordance with 310 CMR 22.15(4) of the Drinking Water Regulations of Massachusetts on a form approved by the Department.
18. The PWS shall implement best management practices regarding sodium hypochlorite to minimize the formation of chlorate.
19. In accordance with the submitted specifications, the Department's Guidelines And Policies for Public Water Systems, and AWWA Standard C-655, thorough consideration should be given to the impact of discharge of highly chlorinated water to the environment. If there is any possibility that chlorinated discharge will cause damage to the environment, a neutralizing chemical, as listed in AWWA standard C-655, shall be applied to the water to be wasted to thoroughly neutralize the chlorine residual remaining in the water. Where necessary, federal, state, and local regulatory agencies should be contacted to determine special provisions for the disposal of heavily chlorinated water.
20. A cross connection survey of the new treatment plant and renovated pumping stations shall be performed by a Massachusetts certified cross connection control surveyor prior to final inspection. Completed and signed standard cross connection control survey forms shall be provided to the Department at the time of final inspection. The PWS shall maintain copies of all cross-connection control documents.
21. The PWS shall maintain communication with its customers regarding any potential water service disruption during the project.

Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

22. The Operation and Maintenance (O&M) manual for each water treatment plant, including a spare parts list and parts order form, shall be updated to include the new chemical feed systems. This O&M manual shall contain information necessary for the operator of the water supply system to properly operate and maintain said system in accordance with the Department's Regulations, *Guidelines* and Policy 93-02 "Operation and Maintenance Manuals."
23. The following shall be prepared and available on site prior to the Department's final inspection of the completed facility: O&M manual; emergency contact sheet; chemical receiving procedure; alarm testing procedure; and quarterly alarm testing logs.
24. The PWS shall not place the treatment facility in service until such time as satisfactory post-treatment results for the following contaminants are provided to the Department from a Massachusetts-certified testing laboratory: bacteria, VOC's, secondary contaminants including iron and manganese, and PFAS. All sample results shall be submitted on standard Department reporting forms with the "SS" (Special Sample) boxes checked.
25. The PWS shall, prior to the construction of the facility, secure any and all approvals necessary for the ultimate disposal of the accumulated water treatment plant residuals in accordance with applicable rules and regulations. In addition, in accordance with the Department's *Guidelines* Chapter 5, Section 10, the PWS shall prepare and provide the Department with a written (electronic pdf document) Waste Disposal Plan including a detailed Residuals Management Plan prior to placing the facility on-line.
26. The PWS shall register its drywells with the Department's Underground Injection Control (UIC) Program using the application found online at: <https://www.mass.gov/underground-injection-control-uic> . Contact Joe Cerutti at 781-465-4123 for guidance.
27. The PWS shall provide the Department with a facility-staffing plan. The plan should detail staff coverage of the new facilities in accordance with the requirements of 310 CMR 22.11B of the Massachusetts Drinking Water Regulations. For this purpose, please be advised the Department has rated the Wells 2, 3, 4 treatment facility at a Grade II-T level.
28. Prior to the Department's final inspection, a Massachusetts Registered Professional Engineer shall submit a stamped certification of the completed works. The certification shall be accompanied by the following:
  - a. A statement certifying that the facilities have been constructed in accordance with the plans and specifications, and are in compliance with the Department's regulations, guidance, policies, and this approval.
  - b. A statement that the facilities are fully operational, tested and ready to be put on-line.
  - c. A statement certifying that the piping and facilities have been disinfected in accordance with the applicable ANSI/AWWA standards.
  - d. A statement certifying that pressure testing of the water mains has occurred, as applicable. A copy of the test results shall be submitted to this office. If a pressure test has not been performed then this office will require one according to the manufacturer's specifications. (See *Guidelines*, Section 9.7.6).
  - e. A form summarizing the critical chemical alarm testing results and other requirements as provided by the Department.

Sharon Water Department  
Sharon, Massachusetts  
PWS ID#4266000  
BRP WS24, Approval to Construct a Facility to Treat > 1MGD.  
Record #24-WS24-0001-APP

29. During the final inspection, the applicant shall demonstrate the operation of the treatment processes, interlocking, alarms and the instrumentation and control system.
30. This permit approval does not grant water withdrawal to exceed those limits authorized by the PWS's Water Management Act Registration and Permit.
31. The Department recommends the PWS assess the vulnerability of the treatment plant and equipment and include the results of the assessment in any security planning.
32. The PWS shall submit a certification to the Department's Air Quality Program within 60 days of installing the emergency power generator. Instructions for the certification can be found at: <https://www.mass.gov/how-to/submit-a-compliance-certification-stationary-engine-or-turbine>.
33. All equipment installations, including horizontal and vertical pumps, shall be guarded in accordance with OSHA standard 1910.219 (rotating equipment) and OSHA standard 1910.212 (all moving equipment.) The PWS is responsible for ensuring compliance with all applicable safety regulations in addition to these specific citations. The review of this permit does not constitute a review of safety requirements under the purview of OSHA or the Massachusetts Department of Labor.

Both the Administrative and Technical Reviews of the following application has been completed: BRP WS24, Treatment Facility Construction > 1 MGD, #24-WS24-0001-APP. This approval pertains only to the water supply aspects of the proposal and therefore does not negate the responsibility of the owners or operators to comply with other applicable laws, and/or regulations.

**B. Findings**

See Attached.

1. Findings pursuant to the Massachusetts Wetlands Protection Act:  
 Following the review of the above-referenced Notice of Intent and based on the information provided in this application and presented at the public hearing, this Commission finds that the areas in which work is proposed is significant to the following interests of the Wetlands Protection Act (the Act). Check all that apply:  
 a.  Public Water Supply b.  Land Containing Shellfish c.  Prevention of Pollution  
 d.  Private Water Supply e.  Fisheries f.  Protection of Wildlife Habitat  
 g.  Groundwater Supply h.  Storm Damage Prevention i.  Flood Control  
 2. This Commission hereby finds the project, as proposed, is: (check one of the following boxes)

**Approved subject to:**

- a.  the following conditions which are necessary in accordance with the performance standards set forth in the wetlands regulations. This Commission orders that all work shall be performed in accordance with the Notice of Intent referenced above, the following General Conditions, and any other special conditions attached to this Order. To the extent that the following conditions modify or differ from the plans, specifications, or other proposals submitted with the Notice of Intent, these conditions shall control.

**B. Findings (cont.)**

Denied because:

- b.  the proposed work cannot be conditioned to meet the performance standards set forth in the wetland regulations. Therefore, work on this project may not go forward unless and until a new Notice of Intent is submitted which provides measures which are adequate to protect the interests of the Act, and a final Order of Conditions is issued. **A description of the performance standards which the proposed work cannot meet is attached to this Order.**
- c.  the information submitted by the applicant is not sufficient to describe the site, the work, or the effect of the work on the interests identified in the Wetlands Protection Act. Therefore, work on this project may not go forward unless and until a revised Notice of Intent is submitted which provides sufficient information and includes measures which are adequate to protect the Act's interests, and a final Order of Conditions is issued. **A description of the specific information which is lacking and why it is necessary is attached to this Order as per 310 CMR 10.05(6)(c).**
- 3.  Buffer Zone Impacts: Shortest distance between limit of project disturbance and the wetland resource area specified in 310 CMR 10.02(1)(a) 0  
 a. linear feet

b. square feet of salt marsh

24.  Stream Crossing(s):

a. number of new stream crossings

b. number of replacement stream crossings

**C. General Conditions Under Massachusetts Wetlands Protection Act**

The following conditions are only applicable to Approved projects.

1. Failure to comply with all conditions stated herein, and with all related statutes and other regulatory measures, shall be deemed cause to revoke or modify this Order.
2. The Order does not grant any property rights or any exclusive privileges; it does not authorize any injury to private property or invasion of private rights.
3. This Order does not relieve the permittee or any other person of the necessity of complying with all other applicable federal, state, or local statutes, ordinances, bylaws, or regulations.
4. The work authorized hereunder shall be completed within three years from the date of this Order unless either of the following apply:
  - a. The work is a maintenance dredging project as provided for in the Act; or
  - b. The time for completion has been extended to a specified date more than three years, but less than five years, from the date of issuance. If this Order is intended to be valid for more than three years, the extension date and the special circumstances warranting the extended time period are set forth as a special condition in this Order.
  - c. If the work is for a Test Project, this Order of Conditions shall be valid for no more than one year.
5. This Order may be extended by the issuing authority for one or more periods of up to three years each upon application to the issuing authority at least 30 days prior to the expiration date of the Order. An Order of Conditions for a Test Project may be extended for one additional year only upon written application by the applicant, subject to the provisions of 310 CMR 10.05(11)(f).
6. If this Order constitutes an Amended Order of Conditions, this Amended Order of Conditions does not extend the issuance date of the original Final Order of Conditions and the Order will expire on 1/26/2027 unless extended in writing by the Department.
7. Any fill used in connection with this project shall be clean fill. Any fill shall contain no trash, refuse, rubbish, or debris, including but not limited to lumber, bricks, plaster, wire, lath, paper, cardboard, pipe, tires, ashes, refrigerators, motor vehicles, or parts of any of the foregoing.

### C. General Conditions Under Massachusetts Wetlands Protection Act

8. This Order is not final until all administrative appeal periods from this Order have elapsed, or if such an appeal has been taken, until all proceedings before the Department have been completed.
9. No work shall be undertaken until the Order has become final and then has been recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land upon which the proposed work is to be done. In the case of the registered land, the Final Order shall also be noted on the Land Court Certificate of Title of the owner of the land upon which the proposed work is done. The recording information shall be submitted to the Conservation Commission on the form at the end of this Order, which form must be stamped by the Registry of Deeds, prior to the commencement of work.
10. A sign shall be displayed at the site not less than two square feet or more than three square feet in size bearing the words,
 

"Massachusetts Department of Environmental Protection" [or, "MassDEP"]  
"File Number                    SE280-0653 "
11. Where the Department of Environmental Protection is requested to issue a Superseding Order, the Conservation Commission shall be a party to all agency proceedings and hearings before MassDEP.
12. Upon completion of the work described herein, the applicant shall submit a Request for Certificate of Compliance (WPA Form 8A) to the Conservation Commission.
13. The work shall conform to the plans and special conditions referenced in this order.
14. Any change to the plans identified in Condition #13 above shall require the applicant to inquire of the Conservation Commission in writing whether the change is significant enough to require the filing of a new Notice of Intent.
15. The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.
16. This Order of Conditions shall apply to any successor in interest or successor in control of the property subject to this Order and to any contractor or other person performing work conditioned by this Order.

### C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

17. Prior to the start of work, and if the project involves work adjacent to a Bordering Vegetated Wetland, the boundary of the wetland in the vicinity of the proposed work area shall be marked by wooden stakes or flagging. Once in place, the wetland boundary markers shall be maintained until a Certificate of Compliance has been issued by the Conservation Commission.
18. All sedimentation barriers shall be maintained in good repair until all disturbed areas have been fully stabilized with vegetation or other means. At no time shall sediments be deposited in a wetland or water body. During construction, the applicant or his/her designee shall inspect the erosion controls on a daily basis and shall remove accumulated sediments as needed. The applicant shall immediately control any erosion problems that occur at the site and shall also immediately notify the Conservation Commission, which reserves the right to require additional erosion and/or damage prevention controls it may deem necessary. Sedimentation barriers shall serve as the limit of work unless another limit of work line has been approved by this Order.
19. The work associated with this Order (the "Project")
  - (1)  is subject to the Massachusetts Stormwater Standards
  - (2)  is NOT subject to the Massachusetts Stormwater Standards

**If the work is subject to the Stormwater Standards, then the project is subject to the following conditions:**

- a) All work, including site preparation, land disturbance, construction and redevelopment, shall be implemented in accordance with the construction period pollution prevention and erosion and sedimentation control plan and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Construction General Permit as required by Stormwater Condition 8. Construction period erosion, sedimentation and pollution control measures and best management practices (BMPs) shall remain in place until the site is fully stabilized.
- b) No stormwater runoff may be discharged to the post-construction stormwater BMPs unless and until a Registered Professional Engineer provides a Certification that:
  - i.* all construction period BMPs have been removed or will be removed by a date certain specified in the Certification. For any construction period BMPs intended to be converted to post construction operation for stormwater attenuation, recharge, and/or treatment, the conversion is allowed by the MassDEP Stormwater Handbook BMP specifications and that the BMP has been properly cleaned or prepared for post construction operation, including removal of all construction period sediment trapped in inlet and outlet control structures;
  - ii.* as-built final construction BMP plans are included, signed and stamped by a Registered Professional Engineer, certifying the site is fully stabilized;
  - iii.* any illicit discharges to the stormwater management system have been removed, as per the requirements of Stormwater Standard 10;

### C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

iv. all post-construction stormwater BMPs are installed in accordance with the plans (including all planting plans) approved by the issuing authority, and have been inspected to ensure that they are not damaged and that they are in proper working condition;

v. any vegetation associated with post-construction BMPs is suitably established to withstand erosion.

c) The landowner is responsible for BMP maintenance until the issuing authority is notified that another party has legally assumed responsibility for BMP maintenance. Prior to requesting a Certificate of Compliance, or Partial Certificate of Compliance, the responsible party (defined in General Condition 18(e)) shall execute and submit to the issuing authority an Operation and Maintenance Compliance Statement ("O&M Statement") for the Stormwater BMPs identifying the party responsible for implementing the stormwater BMP Operation and Maintenance Plan ("O&M Plan") and certifying the following:

i.) the O&M Plan is complete and will be implemented upon receipt of the Certificate of Compliance, and

ii.) the future responsible parties shall be notified in writing of their ongoing legal responsibility to operate and maintain the stormwater management BMPs and implement the Stormwater Pollution Prevention Plan.

d) Post-construction pollution prevention and source control shall be implemented in accordance with the long-term pollution prevention plan section of the approved Stormwater Report and, if applicable, the Stormwater Pollution Prevention Plan required by the National Pollution Discharge Elimination System Multi-Sector General Permit.

e) Unless and until another party accepts responsibility, the landowner, or owner of any drainage easement, assumes responsibility for maintaining each BMP. To overcome this presumption, the landowner of the property must submit to the issuing authority a legally binding agreement of record, acceptable to the issuing authority, evidencing that another entity has accepted responsibility for maintaining the BMP, and that the proposed responsible party shall be treated as a permittee for purposes of implementing the requirements of Conditions 19(f) through 19(k) with respect to that BMP. Any failure of the proposed responsible party to implement the requirements of Conditions 19(f) through 19(k) with respect to that BMP shall be a violation of the Order of Conditions or Certificate of Compliance. In the case of stormwater BMPs that are serving more than one lot, the legally binding agreement shall also identify the lots that will be serviced by the stormwater BMPs. A plan and easement deed that grants the responsible party access to perform the required operation and maintenance must be submitted along with the legally binding agreement.

f) The responsible party shall operate and maintain all stormwater BMPs in accordance with the design plans, the O&M Plan, and the requirements of the Massachusetts Stormwater Handbook.

### C. General Conditions Under Massachusetts Wetlands Protection Act (cont.)

- g) The responsible party shall:
1. Maintain an operation and maintenance log for the last three (3) consecutive calendar years of inspections, repairs, maintenance and/or replacement of the stormwater management system or any part thereof, and disposal (for disposal the log shall indicate the type of material and the disposal location);
  2. Make the maintenance log available to MassDEP and the Conservation Commission ("Commission") upon request; and
  3. Allow members and agents of the MassDEP and the Commission to enter and inspect the site to evaluate and ensure that the responsible party is in compliance with the requirements for each BMP established in the O&M Plan approved by the issuing authority.
- h) All sediment or other contaminants removed from stormwater BMPs shall be disposed of in accordance with all applicable federal, state, and local laws and regulations.
- i) Illicit discharges to the stormwater management system as defined in 310 CMR 10.04 are prohibited.
- j) The stormwater management system approved in the Order of Conditions shall not be changed without the prior written approval of the issuing authority.
- k) Areas designated as qualifying pervious areas for the purpose of the Low Impact Site Design Credit (as defined in the MassDEP Stormwater Handbook, Volume 3, Chapter 1, Low Impact Development Site Design Credits) shall not be altered without the prior written approval of the issuing authority.
- l) Access for maintenance, repair, and/or replacement of BMPs shall not be withheld. Any fencing constructed around stormwater BMPs shall include access gates and shall be at least six inches above grade to allow for wildlife passage.

Special Conditions (if you need more space for additional conditions, please attach a text document):

Please see attached

20. For Test Projects subject to 310 CMR 10.05(11), the applicant shall also implement the monitoring plan and the restoration plan submitted with the Notice of Intent. If the conservation commission or Department determines that the Test Project threatens the public health, safety or the environment, the applicant shall implement the removal plan submitted with the Notice of Intent or modify the project as directed by the conservation commission or the Department.

## WETLANDS PROTECTION ACT REGULATIONS

The following WPA regulations were referred to and used in arriving at the findings of and decision made by the Commission:

10.53 (1), (3), (3)(d)1, 2, 3, (7);

10.58 (1), (3), (4), (4)(d)(1), (5), (5)(c), (5)(g).

## FINDINGS

The Commission found that while there were treatment plant alternatives presented at the Well 2 and Well 3 sites, they were not practicable nor substantially equivalent, economically or environmentally, due to what the Commission believed were greater adverse impacts to interests protected under the Wetlands Protection Act from construction at those sites.

Two treatment plant options at Well 2 were dropped from consideration due to constraints related to the floodplain elevation, required earthwork, and the steepness of the access road once the facility was moved high enough out of the floodplain.

The Well 3 alternative that was considered would require three separate lengths of water main to be horizontally bored for 1,690 feet under the Beaver Brook resource area, including below the stream channel, bordering wetland, and floodplain. Important to consider is the fact that this Well 3 alternative would place the town's entire water supply within one 12-inch 1,690-foot-long main below the resource area as it is pumped back from Well 3 to the distribution system near Well 4. One of the other two 8-inch mains below the resource area, carrying raw water from Well 4 to Well 3 for treatment, would also be critical to the water supply. The third 8-inch main would carry raw water from Well 2 for treatment at Well 3. The Commission agrees with the third-party review anticipating the potential for serious impacts within the Beaver Brook resource area due to construction, future maintenance, or in the event of a failure.

The Well 4 option includes one 8-inch raw-water main horizontally bored from near Well 3 through the Beaver Brook resource area. This main is the same length and in the same location as the three mains associated with the Well 3 alternative. Loss of this raw water main for maintenance or to address a failure would not disrupt the town's ability to supply water nor would it require an expedient response. With additional time to engineer a solution, the potential for impacts to the resource area could be minimized.

The area of construction impact to the riverway at Well 4 (23,203 sq. ft.) is less than the allowable 10% of the total riverfront area on the site (7.25 acres (315,870 sq. ft.) (10.58 4(d)1). Changes have been incorporated into the design in response to abutter concerns raised during the hearing process to help decrease that impact.

A suitable parcel exists to serve as mitigation under 310 CMR 10.58(5)(g) for the riverfront impacts of this project.

Therefore, after careful consideration of evidence presented during the hearing process by the applicants, consultants, and concerned abutters, the Commission issues the following Order of Conditions:

ORDER- in addition to “boiler plate” conditions, the following special conditions shall apply.

1. The Final Order of Conditions for DEP# SE280-0653 must be recorded with the Norfolk County Registry of Deeds, 649 High Street, Dedham, MA 02026.
2. After recording the original order with the Norfolk County Registry of Deeds, the applicant/owner must provide proof of recording with recording information to the Conservation Department before any site work begins.
3. No work is to commence until a DEP number sign is displayed at the site.
4. Work performed shall be per approved NOI site plans. Any changes or deviations within the Conservation Commission’s regulatory jurisdiction will require additional review and approval.
5. Erosion control measures shall be installed and inspected by the Conservation Administrator prior to the start of work.
6. The Conservation office shall be notified at least two business days prior to the start of the horizontal directional drilling.
7. Plantings done per the Planting Plan dated 1/16/2024 shall be 80% successful at the end of two full growing seasons. The growing season shall be defined as May 1<sup>st</sup> through September 30<sup>th</sup>. The first full growing season for plants put in after May 1<sup>st</sup> shall be the following year.
8. As mitigation for the riverfront impacts of this project, a Conservation Restriction (CR) shall be placed on a portion of Beaver Brook riverfront area on a parcel of land owned by the Water Department to the north of the subject parcel. The CR shall be consistent with the requirements of 310 CMR 10.58(5)(g). Recording of the CR at the Registry of Deeds shall occur prior to the issuance of a Certificate of Compliance for the project.

**F. Appeals**

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate MassDEP Regional Office to issue a Superseding Order of Conditions. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant.

Any appellants seeking to appeal the Department’s Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order, or providing written information to the Department prior to issuance of a Superseding Order.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal ordinance or bylaw, and not on the Massachusetts Wetlands Protection Act or regulations, the Department has no appellate jurisdiction.

## APPENDIX G

Zoning Board of Appeals Special Permit Decision

DECISION ON APPLICATION FOR RENEWAL OF SPECIAL PERMIT

APPLICANT: Town of Sharon Department of Public Works by its consultant, Environmental Partners Group, LLC - Case No. 1927

PROPERTY LOCATION: 15 Tree Lane, Sharon, MA

By application (“Application”) filed with the Sharon Town Clerk on January 16, 2024, Town of Sharon Department of Public Works by its consultant, Environmental Partners Group, LLC. (“Applicant”), petitioned the Town of Sharon Zoning Board of Appeals for Minor Site Plan Review for the construction of a new water treatment plant and water mains for Wells 2, 3, and 4 at 15 Tree Lane, Sharon, MA (the “Property”), in order to come into compliance with current and proposed drinking water regulations for PFAS and for the removal of source water iron and manganese. These are as follows:

1. Applicant seeks approval under Section 10.6.4 , Minor Site Plan Review, as set forth in the Town of Sharon, MA Zoning Code, Division 1, Part 2, Chapter 275 of the Sharon Massachusetts By-Laws. Site plan review is required for the projects listed below:
  - a. Construction, exterior alteration, exterior expansion, or change of use within a municipal, institutional, commercial, or industrial project.
  - b. Residential projects involving three or more dwelling units; or
  - c. Construction or expansion of a parking lot for a municipal, institutional, commercial, industrial, or residential structure with 20 or more parking spaces.
2. Applicant also requests the granting of such other Special Permits, Variances, Findings, or any other relief which the Zoning Board determines requisite for the proposed use.

A hearing, duly noticed under the applicable statutes and Bylaw provisions was opened via Zoom Meeting on February 28, 2024, and continued on March 13, 2024, and closed as requested by the applicant. The voting members were Garber, Mehta & Wallenstein.

At the opening hearing, the Zoning Board of Appeals and the Applicant reviewed the following correspondence, a memo from the Kevin Davis, Agent of the Board of Health, dated February 22, 2024, and a memo from Conservation Administrator, Josh Philibert, dated January 30, 2024.

DECISION:

Having considered the Application, the evidence presented at the public hearing and all of the public records, the Zoning Board of Appeals voted 3-0-0 (Garber, Mehta, Wallenstein) to grant the Applicant a Minor Site Plan Review pursuant to Section 10.6.4 of the Zoning By-Law.

In rendering this Decision, the Zoning Board of Appeals notes that the Minor Site Plan review issued hereunder shall expire within twenty-four (24) months (exclusive of the time required to pursue or await the determination of an appeal referred to in M.G.L., Chapter 40A, Section 17) from the grant hereof if a substantial use thereof has not sooner commenced, except for good cause, or in the case of a permit for construction, if construction has not begun by such date, except for good cause.

Appeals, if any, shall be made pursuant to M.G.L. Chapter 40A, Section 17 and shall be filed within twenty days after the date of the filing of this Decision in the Office of the Sharon Town Clerk.

This Decision shall not take effect until a copy of the Decision bearing the certification of the Sharon Town Clerk that twenty (20) days have elapsed after the Decision has been filed in the Office of the Sharon Town Clerk and no appeal has been filed or that if such appeal has been filed, that it has been dismissed or denied, is recorded with the Registry of Deeds for the county and district in which the land is located and indexed, in the grantor index under the name of the owner of record or is recorded and noted on the owner's certificate of title.

IN WITNESS WHEREOF, the undersigned has executed this instrument under seal as of the date set forth below.

By: \_\_\_\_\_  
Joe Garber, Chair  
Town of Sharon Zoning Board of Appeals

Dated: \_\_\_\_\_, 2024

I, Joe Garber, Chairman of the Town of Sharon Zoning Board of Appeals, hereby certify on behalf of the Town of Sharon Zoning Board of Appeals that the foregoing is a true copy of the Decision of the Sharon Zoning Board of Appeals and that certified copies of the Decision referred to herein have been filed with the Planning Board and the Town Clerk.

By: \_\_\_\_\_  
Joe Garber, Chair  
Town of Sharon Zoning Board of Appeals

\*\*\*\*\*

Filed in the Office of the Town Clerk on the \_\_\_\_\_ day of \_\_\_\_\_, 2024.

\_\_\_\_\_  
Mark F. Hogan, Town Clerk

I, Mark F. Hogan, Town Clerk of the Town of Sharon, hereby certify that the foregoing is a true copy of the Decision of the Town of Sharon Zoning Board of Appeals dated \_\_\_\_\_ and filed with the Office of the Town Clerk on \_\_\_\_\_ and those twenty (20) days have elapsed after the date of such filing without the filing of any appeal on such Decision.

Dated: \_\_\_\_\_

\_\_\_\_\_  
Mark F. Hogan, Town Clerk

## EXHIBIT A

This Decision is subject to the following standard conditions:

### **Standard Conditions:**

- 1) The proposed structural expansion use shall be as shown on the Plans approved, as submitted by the Applicant dated November 20, 2023.
- 2) Any construction area shall be returned to the condition it was in prior to the commencement of construction.
- 3) The Premises shall be equipped with water conserving showerheads, water conserving faucets and water conserving flush toilets.
- 4) All fertilizers, pesticides and herbicides used at the Premises shall be organic and of the low nitrogen content variety.
- 5) The property will require further evaluation by the Sharon Board of Health to ensure that the septic system shall meet all current requirements. The septic system shall be maintained in accordance with the requirements of the Sharon Board of Health.
- 6) There shall be no garbage disposers or disposals at the Premises.
- 7) No sodium chloride (road salt) shall be used on any driveways or walkways at the Premises.
- 8) Only laundry detergents with no phosphorous shall be used at the Premises, and only dishwashing detergents with low phosphorous shall be used at the Premises.
- 9) Leaders for roof gutters must be directed into drywells.

This Decision is subject to the following special conditions:

### **Special Conditions:**

- 1) Neighbors to be included in discussion and review of planting plans within 12 months prior to installation.
- 2) Install public safety construction signage on Pine Grove Ave, Norwood Street, Tree Lane and Upland Road.
- 3) Traffic Mitigation – control and limit construction traffic on Tree Lane
- 4) Install 6-foot chain linked construction fencing with windscreen blockage.
- 5) Potential jersey barrier or gated road for pedestrian and children safety for entry at Pine Grove Ave and Tree Lane towards Upland Road.

MassDEP Facility ID# (if known) \_\_\_\_\_

**A. Facility Information**

**Important:** When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.

1. Facility Location:

Facility Name \_\_\_\_\_

Street Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip Code \_\_\_\_\_

Federal Employer ID # (FEIN) \_\_\_\_\_

2. Mailing Address and Contact Information:

Street/PO Box: \_\_\_\_\_ Email Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip Code \_\_\_\_\_

Telephone Number \_\_\_\_\_ Fax Number \_\_\_\_\_

Contact Person Name \_\_\_\_\_ Contact Person Title \_\_\_\_\_

**B. Compliance Information**

Complete and submit an Initial Compliance Certification form for *each* new emergency engine and emergency turbine that is subject to the Environmental Results Program (ERP) for Emergency Engines and Emergency Turbines. Answer all questions. **IMPORTANT NOTE:** Answering "No" to certain questions requires completion of the Return to Compliance form. In these cases, the notation "RTC" appears next to "No."

	Engine or Turbine	Genset
Manufacturer of Unit	_____	_____
Model #	_____	_____
Serial #	_____	_____
Rated Power Output (Engine or Turbine)	_____	N/A
Electrical Output (Kilowatts)	N/A	_____
Date Installed (MM/DD/YYYY)	_____	_____
EPA Certificate # for Unit (Oil-Fired Engines Only)	_____	_____
Date Operation Commenced (MM/DD/YYYY)	_____	_____

**Installation Compliance Certification**  
**For New Emergency Engines and Emergency Turbines**

Facility Name \_\_\_\_\_

MassDEP Facility ID# (if known) \_\_\_\_\_

**B. Compliance Information** (continued)

1. Is the new unit an emergency engine?  Yes – Go to Question 3  No
2. Is the new unit an emergency turbine?  Yes  No
3. Is the primary fuel to be burned natural gas?  Yes  No
- 4a. Is the primary fuel to be burned fuel oil?  Yes  No
- 4b. Are you only accepting delivery of fuel that meets the sulfur content limits pursuant to 310 CMR 7.05 (i.e., less than 15 ppm sulfur)?  Yes  No  
*Workbook Section 2.2.*
- 5a. For emergency engines burning fuel oil, have you attached to this certification a statement from the supplier that the engine has been issued, by the Administrator of the U.S. Environmental Protection Agency (EPA), a certificate of conformity stating that it meets the applicable emission standards?  Yes  No – RTC  
*Workbook Section 2.1.*
- 5b. For emergency engines burning natural gas, have you attached a letter or other documentation from your supplier that the engine meets the applicable non-road emission limitations that will satisfy the certificate of conformity requirement at the time of installation and is capable of compliance with the emission limitations for the first three years of operation?  Yes  No – RTC  
*Workbook Section 2.1.*
6. Is the unit equipped with a non-turn back hour counter?  Yes  No – RTC  
*Workbook Section 2.3.*
7. Will the emergency engine only operate during emergencies, and for up to 100 hours/year for maintenance checks and readiness testing (or as otherwise approved by EPA) including up to 50 hours/year for non-emergency use, as allowed by 40 CFR 63 part ZZZZ?  Yes  No – RTC
- 8a. Is the exhaust stack configured to discharge combustion gases vertically, and not equipped with any part or device that restricts the vertical exhaust flow of the emitted combustion gases?  Yes  No – RTC  
*Workbook Section 2.4.*

**Massachusetts Department of Environmental Protection**  
**Environmental Results Program**  
**Installation Compliance Certification**  
**For New Emergency Engines and Emergency Turbines**

\_\_\_\_\_  
 Facility Name

\_\_\_\_\_  
 MassDEP Facility ID# (if known)

**B. Compliance Information** (continued)

- 8b. Have you located the unit to minimize emission impacts on sensitive receptors, including but not limited to, people, windows and doors that open, and building fresh air intakes, by employing good air pollution control engineering practices? Such practices include avoiding locations that may be subject to downwash of the exhaust and providing sufficient stack height to minimize flue gas impacts upon sensitive receptors.
- Yes  No – RTC

*Workbook Section 2.4*

**For questions 8c and 8d, answer only the questions that apply to your unit's power output rating. If your unit is rated at less than 300 kilowatts, skip to Question 12.**

- 8c. If the unit has a power output rating of 300 kilowatts or greater, is the height of the stack a minimum of ten feet above the facility rooftop or unit enclosure, whichever is lower?
- Yes – If Unit is Below 1 Megawatt Go to Question 11; otherwise Go to Question 8d  No – RTC

*Workbook Section 2.4*

- 8d. If the unit has a power output rating of one megawatt or greater, is the height of the stack at least ten feet above and greater than 1.5 times above the height of the building, and higher than the height of any structure that is within 5L of the stack (5L being five times the lesser of the height or maximum projected width of the structure)?
- Yes – Go to Question 11  No – Go to Question 9

*Workbook Section 2.4*

9. If you answered No to Question 8d, have you performed an analysis using an EPA dispersion model to determine that emissions will not cause a violation of the National Ambient Air Quality Standards?
- Yes  No – RTC

*Workbook Section 2.4.*  
*See Appendix 1 for data needs*

10. Did the analysis demonstrate that the stack emissions will not cause a violation of the National Ambient Air Quality Standards? (Attach a copy of the analysis to this certification form)
- Yes  No – RTC

11. Is the unit designed, and have you located the unit, so that when operated sound impacts upon sensitive receptors will be minimized and will be in compliance with 310 CMR 7.10 Noise?
- Yes  No – RTC

*Workbook Section 2.5.*

**Massachusetts Department of Environmental Protection**  
**Environmental Results Program**  
**Installation Compliance Certification**

 MassDEP Facility ID# (if known)

12. Have you put in place procedures to maintain records as listed in Section 2.6 of the workbook?  Yes  No – RTC

**C. Certification Statement**

Note: Complete all required forms before signing this statement

I attest under the pains and penalties of perjury:

- I. That I have personally examined and am familiar with the information contained in this submittal, including any and all documents accompanying this certification statement;
- II. That, based on my inquiry of those individuals responsible for obtaining the information, the information contained in this submittal is, to the best of my knowledge, true, accurate, and complete;
- III. That systems to maintain compliance are in place at the facility and will be maintained even if processes or operating procedures are changed; and
- IV. That I am fully authorized to make this attestation on behalf of this facility.

I am aware that there are significant penalties, including, but not limited to, possible fines and imprisonment, for willfully submitting false, inaccurate, or incomplete information.

APPENDIX A2

Certification Statements wording required in the BID PROPOSAL of contracts bid under the provisions of c.149 s 44A – 44J (Building Contract with filed Sub-bids)

Pursuant to M.G.L. Ch. 62C, s 49A, I certify under the penalties of perjury that I, to my best knowledge and belief, have filed all state tax returns and paid all State Taxes Required under law.

The undersigned bidder hereby certifies he/she will comply with the specific affirmative action steps contained in the Equal Employment Opportunity/Affirmative Action (EEO/AA) provisions of this Contract, including compliance with the Disadvantaged Business Enterprise provisions as required under these contract provisions. The contractor receiving the award of the contract shall incorporate the EEO/AA provisions of this contract into all subcontracts and purchase orders so that such provisions will be binding upon each subcontractor or vendor.

The undersigned certifies under penalties of perjury that there have been no substantial changes in his financial position or business organization other than those changes noted within the application since the applicant's most recent pre-qualification statement and that the bid is in all respects bonafide, fair and made without collusion or fraud with any other person.

c149 s44D (1)(b) "Person" shall mean any natural person, joint venture, partnership, corporation or other business or legal entity which sells materials, equipment or supplies used in or for, or engages in the performance of, the same or similar construction, reconstruction, installation, demolition, maintenance or repair work or any part thereof.

c149 s44E (2) The undersigned hereby certifies that he is able to furnish labor that can work in harmony with all other elements of labor employed or to be employed on the work and that he will comply fully with all laws and regulations applicable to awards made subject to section forty-four A.

c149 s44E (3) The undersigned further certifies under penalty of perjury that the said undersigned is not presently debarred from doing public construction work in the Commonwealth of Massachusetts under the provision of Section Twenty-Nine F of Chapter Twenty-Nine, or any other applicable debarment provisions of any other Chapter of the General Laws or any rule or regulation promulgated thereunder; and is not presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from covered transactions by any Federal department or agency.

## APPENDIX B DIESEL RETROFIT PROGRAM

The Department of Environmental Protection (“DEP”) has developed the Diesel Retrofit Program in response to increasing public health concerns with the emissions from diesel engines and vehicles.

### **Diesel Construction Equipment Standard**

All diesel powered non-road construction equipment and vehicles greater than 50 brake horsepower which will be used in the performance of the work under the Contract (hereinafter “Diesel Construction Equipment”) must have the following pollution control device installed unless exempt as provided below:

1. Emission control technology verified by U.S. Environmental Protection Agency (“EPA”) or the California Air Resources Board (“CARB”) for use with non-road engines;
2. Emission control technology verified by EPA or CARB for use with on-road engines provided that such equipment is operated with diesel fuel that has no more than 15 parts per million sulfur content (i.e. Ultra Low Sulfur Diesel fuel); or
3. Emission control technology certified by the manufacturer that such technology meets or exceeds the emission reductions provided by on-road or off-road emission control technology verified by EPA or CARB, i.e. that a Diesel Oxidation Catalyst is achieving the following minimum emission reductions: particulate matter 20%; carbon monoxide 40%; volatile organic compounds 50%; or a Diesel Particulate Filter is achieving a minimum of 85% emission reductions for particulate matter.

Emission control devices, such as oxidation catalysts or particulate filters, shall be installed on the exhaust system side of the Diesel Construction Equipment. The Contractor shall be responsible to insure that the emissions control technology is operated, maintained, and serviced as recommended by the manufacturer.

For the latest up-to-date list of EPA verified-technologies, see:

<https://www.epa.gov/verified-diesel-tech>

For the latest up-to-date list of CARB verified technologies, see:

<http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm>

### **Exemptions**

The following Diesel Construction Equipment shall be exempt from the standard above. The Contractor shall include such Diesel Construction Equipment in the required recordkeeping:

1. Diesel Construction Equipment not owned by the Contractor and used in the performance of the work under this Contract for 30 calendar days (cumulative days but not necessarily consecutive) or less;
2. Unless otherwise exempt, additional Diesel Construction Equipment originally not anticipated to be used under the Contract or used as permanent replacement after the work under the Contract has commenced, for 15 calendar days from the date such Diesel Construction Equipment is brought on site;

**APPENDIX B (cont.)  
DIESEL RETROFIT PROGRAM**

3. Diesel Construction Equipment with an engine that meets the EPA particulate matter (PM) Tier emission standards in effect at the start of the Contract for non-road diesel engines for the applicable engine power group (e.g., as of January 1, 2009, a piece of Diesel Construction Equipment with a Tier 3 engine is exempt from meeting the standard until the piece of Diesel Construction Equipment is available with a Tier 4 engine) provided that if such emissions standards are superseded during the Contract then such Diesel Construction Equipment must be retrofitted in accordance with the standards above prior to the end of the Contract;
4. A large crane (e.g. a sky crane or link belt crane which is responsible for critical lift operations) if such device would adversely affect the operation of the crane provided the Contractor submits to the municipality's project engineer written technical justification documenting the adverse impact on operation; and
5. Diesel Construction Equipment that the project engineer has determined is necessary to control a compelling emergency including but not limited to, the need for rescue vehicles or other equipment to prevent harm to human beings or additional equipment required to address a catastrophic emergency such as structure collapse or imminent collapse. After the compelling emergency is controlled, such non-compliant equipment must be removed from the Contract site and may not be used in further performance of the work under this Contract. Meeting Contract deadlines is not a compelling emergency.

**Contractor Certification**

Each bidder shall submit as part of its bid, the Statement of Intent to Comply. Within 10 days of being notified that it has been awarded a contract, the bidder and each of its Contractors and Subcontractors shall submit a Diesel Retrofit Program Contractor Certification. Each such Certification shall contain the following information for each piece of Diesel Construction Equipment:

1. Contractor or Subcontractor name;
2. Equipment type, make, model;
3. Vehicle Identification Number or VIN;
4. Engine model and year of manufacture;
5. Engine HP rating;
6. Emission Control Device (ECD) type (Diesel Oxidation Catalyst or Diesel Particulate Filter);
7. ECD make, model, and manufacturer;
8. ECD EPA or CARB Verification Number or manufacturer's certification that the DOC or DPF meets or exceeds emission reductions provided by similar emission control technology verified by EPA or CARB;
9. ECD installation date;
10. Type of fuel to be used; and
11. Whether the equipment is owned or rented.

**Recordkeeping**

Each Contractor and Subcontractor shall maintain detailed records of all Diesel Construction Equipment used under the Contract, including the dates and duration times the Diesel Construction Equipment is

**APPENDIX B (cont.)**  
**DIESEL RETROFIT PROGRAM**

used at the Contract site. Records shall be available for inspection by DEP. Each Contractor and Subcontractor shall notify DEP within 48 hours of any new Diesel Construction Equipment brought onto the Contract site.

For Diesel Construction Equipment that has an emissions control device with a manufacturer's certification, the Contractor shall maintain records of all supporting emissions test data and test procedures. If upon review the emissions reductions are not supported by the test data and test procedures, then the emissions control device may need to be replaced with a compliant retrofit device.

**Project Regulatory Agreement**

The following language shall be included section 4 (Covenants of the Borrower) of the municipality's Project Regulatory Agreement if it receives funds from the State Revolving Fund:

The Borrower shall require each Contractor and Subcontractor to submit the Diesel Retrofit Program Contractor Certification to DEP and the Borrower prior to commencing work on the Project. The Borrower shall not allow any Contractor or Subcontractor to commence work at the Project site prior to submitting such Certification.

**APPENDIX B (cont.)  
DIESEL RETROFIT PROGRAM**

**STATEMENT OF INTENT TO COMPLY**

*This form must be signed and submitted by the bidder as part of the bid.*

**Local Governmental Unit** \_\_\_\_\_ **SRF Project No.** \_\_\_\_\_

**Contract No.** \_\_\_\_\_ **Contact Title** \_\_\_\_\_

**Bidder** \_\_\_\_\_

**The undersigned, on behalf of the above-named Bidder, agrees that, if awarded the Contract:**

- 1. the Bidder shall comply with the Massachusetts Department of Environmental Protection's ("MassDEP") Diesel Retrofit Program by ensuring that all diesel powered non-road construction equipment and vehicles greater than 50 brake horsepower which will be used in the performance of the work under the Contract are equipped or retrofitted with a pollution control device in accordance with the Diesel Retrofit Program Standard;**
- 2. the Bidder shall require all Subcontractors to comply with MassDEP's Diesel Retrofit Program by ensuring all diesel powered non-road construction equipment and vehicles greater than 50 brake horsepower which will be used in the performance of the work under the Contract are equipped or retrofitted with a pollution control device in accordance with the Diesel Retrofit Program Standard; and**
- 3. The Bidder shall submit and shall require each Subcontractor to submit a Diesel Retrofit Program Contractor Certification (form attached) with a Diesel Retrofit List to MassDEP Municipal Services and the Bidder within 10 days of the bidder being notified that it has been awarded the Contract. The Bidder shall require each Subcontractor to update such Certification and List within 2 days of using additional Diesel Construction Equipment on the project under the Contract.**

\_\_\_\_\_  
**(Signature of Bidder's Authorized Representative)** **(Date)**

**APPENDIX B (cont.)**  
**DIESEL RETROFIT PROGRAM CONTRACTOR CERTIFICATION**

*Each Contractor and its Subcontractor(s) must sign and email this form to the DEP DMS project engineer, within 10 days after the contractor is awarded.*

**Local Governmental Unit** \_\_\_\_\_ **SRF Project No.** \_\_\_\_\_

**Contract No.** \_\_\_\_\_ **Contact Title** \_\_\_\_\_

**Contractor** \_\_\_\_\_

I, \_\_\_\_\_, an authorized signatory for \_\_\_\_\_, whose principal place of business is at \_\_\_\_\_ do hereby certify that any and all diesel powered non-road construction equipment and vehicles greater than 50 brake horsepower which will be used in the performance of the work under the Contract (hereinafter "Diesel Construction Equipment") have pollution control devices, such as oxidation catalysts or particulate filters, installed on the exhaust system side of the diesel combustion engine equipment in accordance with the Diesel Retrofit Program Standard.

I am submitting on behalf of \_\_\_\_\_ a list of all said Diesel Construction Equipment, labeled "Diesel Retrofit List," that will be used in connection with this Contract by \_\_\_\_\_. I hereby certify that the information on the attached Diesel Retrofit List is correct and accurate as of the date of signature. The List includes the following information for each piece of Diesel Construction Equipment:

1. Equipment type, make, model;
2. Vehicle Identification Number or VIN;
3. Engine model and year of manufacture;
4. Engine HP rating;
5. Emission Control Device ("ECD") type (Diesel Oxidation Catalyst or Diesel Particulate Filter);
6. ECD make, model, and manufacturer;
7. ECD EPA or CARB Verification Number or manufacturer's certification that the DOC or DPF meets or exceeds emission reductions provided by similar emission control technology verified by EPA or CARB;
8. ECD installation date;
9. Type of fuel to be used; and
10. Whether the equipment is owned or rented.

**APPENDIX B (cont.)**

**DIESEL RETROFIT PROGRAM CONTRACTOR CERTIFICATION**

\_\_\_\_\_ shall notify DEP within 48 hours of any new Diesel Construction Equipment brought onto the Contract site. \_\_\_\_\_ shall maintain detailed records of all Diesel Construction Equipment used at the Contract site, including the dates and duration times the Diesel Construction Equipment is used at the Contract site. \_\_\_\_\_ shall make such records available for inspection by DEP. \_\_\_\_\_ shall ensure that the emissions control technology for each piece of Diesel Construction Equipment is operated, maintained, and serviced as recommended by the manufacturer. \_\_\_\_\_ shall retrofit prior to the end of the Contract any Diesel Construction Equipment no longer exempt from meeting the Diesel Construction Equipment Standard under exemption 3 (because it had an engine that met the EPA particulate matter (PM) Tier emission standards currently in effect at the start of the Contract for non-road diesel engines for the applicable engine power group and such emissions standards were superseded during the Contract).

I acknowledge that this certificate is being furnished as a requirement under this Contract and is subject to applicable State and federal laws, both criminal and civil. Signed under pains and penalty of perjury on this date \_\_\_\_\_.

**APPENDIX E  
CONSTRUCTION BID SPECIFICATIONS  
SPECIAL PROVISIONS FOR DISADVANTAGED BUSINESS ENTERPRISES  
MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION  
DIVISION OF MUNICIPAL SERVICES**

DISADVANTAGED BUSINESS ENTERPRISE PROGRAM BACKGROUND

In May 2008 a United States Environmental Protection Agency (EPA) rule became effective that changed the Minority Business Enterprise (MBE) and Women Business Enterprise (WBE) Program to a Disadvantaged Business Enterprise (DBE) Program.

For firms to qualify under the old MBE/WBE program they needed to be socially disadvantaged and had to be certified by the Supplier Diversity Office (SDO). Under the new DBE rule, the firms must be both **socially** and **economically** disadvantaged, **citizens of the United States**, and certified as a DBE. Women and certain minorities are presumed to be socially disadvantaged. The economic disadvantage is measured by the owner's initial and continuing personal net worth of less than \$1,320,000.

Because the Clean Water Act requires the use of MBEs and WBEs, these firms will still be utilized in the State Revolving Fund (SRF) Loan Program, but they must also be certified as DBEs.

SDO will continue to be the certifying agency for the SRF program. SDO certifies firms under the federal Department of Transportation program, which is acceptable for use in the SRF program. An additional form has been added to the DBE package to verify that DBEs are owned or controlled by United States citizens.

**BID SPECIFICATIONS**

**I.** In this contract, the percentage of business activity to be performed by disadvantaged business enterprise(s) (DBE) shall not be less than the following percentages of the total contract price or the percentage submitted by the contractor in the Schedule of Participation, whichever is greater:

Disadvantaged MBE (D/MBE) 4.2%

Disadvantaged WBE (D/WBE) 4.5%

## II. DEFINITIONS

For the purpose of these provisions, the following terms are defined as follows:

- A. Awarding Authority – Entity that awards a prime contract under a State Revolving Fund loan.
- B. Bidder - Any individual, partnership, joint venture, corporation, or firm submitting a price, directly or through an authorized representative, for the purpose of performing construction or construction related activities under a Contract.
- C. Certified DBE – A DBE certified by the United States Small Business Administration, under its 8(a) Business Development Program (13 CFR part 124, subpart A) or its Small Disadvantaged Business Program (13 CFR part 124, subpart B); The United States Department of Transportation (DOT), under its regulations for Participation by DBSs in DOT programs (49 CFR parts 23 and 26); or SDO in accordance with 40 CFR part 33; provided that the certification meets the U.S. citizenship requirement under 40 CFR §33.202 or §33.203.
- D. Compliance Unit - A subdivision of MassDEP’s Affirmative Action Office designated to ensure compliance under these provisions.
- E. Contractor - Any business that contracts or subcontracts for construction, demolition, renovation, survey, or maintenance work in the various classifications customarily used in work and that is acting in this capacity under the subject contract.
- F. Construction Related Services - Those services performed at the work site ancillary to, and/or in support of, the construction work, such as hauling, trucking, equipment operation, surveying or other technical services, etc. For the purposes hereof, supply and delivery of materials (e.g. pre-cast concrete elements) to the site by a supplier who has manufactured those goods, or substantially altered them before re-sales shall be considered as “construction related services
- G. Construction Work - The activities at the work site, or labor and use of materials in the performance of constructing, reconstructing, erecting, demolishing, altering, installing, disassembling, excavating, etc, all or part of the work required by the Contract Documents.
- H. Disadvantaged Business Enterprise (DBE) - An entity owned or controlled by a socially and economically disadvantaged individual as described by Public Law 102-389 (42 U.S.C. 4370d) or an entity owned and controlled by a socially and economically disadvantaged individual as described by Title X of the Clean Air Act Amendments of 1990 (42 U.S.C. 7601 note); a Small Business Enterprise (SBE); a Small Business in a Rural Area (SBRA); or a Labor Surplus Area Firm (LAF), a Historically Underutilized Business (HUB) Zone Small Business Concern, or a concern under a successor program.

- I. Equipment Rental Firm - A firm that owns equipment and assumes actual and contractual responsibility for renting said equipment to perform a useful function of the work of the contract consistent with normal industry practice
- J. Good Faith Efforts – The race and/or gender neutral measures described in 40 CFR 33, subpart C.
- K. HUBZone - A historically underutilized business zone, which is an area located within one or more qualified census tracts, qualified metropolitan counties, or lands within the external boundaries of an Indian reservation.
- L. HUBZone small business concern - A small business concern that appears on the List of Qualified HUBZone Small Business Concerns maintained by the Small Business Administration.
- M. Joint Venture - An agreement between SDO certified DBE and a non-DBE or non-DBE controlled enterprise.
  - 1. A pairing of companies will be considered a DBE joint venture if the SDO certified DBE which is part of the relationship has more than 51% of the profits that are derived from that project.
  - 2. A joint venture between a certified DBE subcontractor and a non DBE subcontractor, in which the DBE for that proportion of the joint venture’s contract equal to the DBE participation in the joint venture.
  - 3. Whenever a general bid is filed by a joint venture with a certified DBE participant in the joint venture that does not exercise more than 51% control over management and profits, that joint venture shall be entitled to credit as a DBE for that portion of the joint venture’s contract equal to the DBE participation in the joint venture. Minority As deemed by SDO.
- N. Labor surplus area firm (LSAF) - A concern that together with its first-tier subcontractors will perform substantially in labor surplus areas (as identified by the Department of Labor in accordance with 20 CFR part 654). Performance is substantially in labor surplus areas if the costs incurred under the contract on account of manufacturing, production or performance of appropriate services in labor surplus areas exceed 50 percent of the contract price.
- O. Letter of Intent – Certified document signed by the principal(s) of the DBE with respect to the work to be performed under contract.
- P. Local Government Unit (LGU) – A city, town, or municipal district which applies for a loan under the Clean Water Trust Program.
- Q. Material Supplier – A vendor certified by SDO as a DBE in sales to supply industry from an established place of business or source of supply, and that vendor.

1. Manufactures goods from raw materials, or substantially utilizes them in the work, or substantially alters them before resale, entitling the general contractor to DBE credit for 100% of the purchase order.
  2. Provides and maintains a storage facility for materials utilized in the work, entitling the general contractor to DBE credit for 10% of the purchase order
- R. Minority and Women Business Enterprise (M/WBE) – Any business concern certified by the SDO as a bona-fide M/WBE. A bona-fide M/WBE is a business whose minority group/women ownership interests are real, which have at least 51% ownership and control over management and operation.
- S. Percent of Total Price – Is the percentage to be paid to the DBE, work they perform, as compared to the total bid price
- T. Recipient - An agency, person or political subdivision which has been awarded or received financial assistance by the Trust or MassDEP.
- U. Small business, small business concern or small business enterprise (SBE) - A concern, including its affiliates, that is independently owned and operated, not dominant in the field of operation in which it is bidding, and qualified as a small business under the criteria and size standards in 13 CFR part 121.
- V. Small business in a rural area (SBRA) - A small business operating in an area identified as a rural county with a code 6-9 in the Rural-Urban continuum Classification Code developed by the United States Department of Agriculture in 1980.
- W. SDO – The Supplier Diversity Office.
- X. Subcontractor – A company, firm, joint venture, or individual who enters into an agreement with a contractor to provide services pursuant to an award of financial assistance.
- Y. Total Contract Price – The total amount of compensation to be paid for all materials, work or services rendered in the performance of the contract
- Z. Trust – The Massachusetts Clean Water Trust established by M.G.L. c.29.

### **III. REQUIREMENTS FOR CONTRACT AWARD**

DBE packages must be submitted by the two lowest bidders on the project. Following bid opening, the LGU shall notify the two lowest bidders to submit DBE packages to the LGU or the LGUs consultant, as directed. By the close of business on the third business day after notification, the two lowest bidders, including a bidder who is a MBE, WBE or DBE, shall submit the following information:

- A. A Schedule of Participation (Form EEO-DEP-190). The Schedule of Participation shall list those certified DBEs the bidder intends to use in fulfilling the contract obligations, the nature of the work to be performed by each certified DBE subcontractor and the total price they are to be paid.
  - 1. A listing of bona-fide services such as a professional, technical, consultant or managerial services, assistance in the procurement of essential personnel, facilities, equipment, materials, or supplies required for performance of the contract, and reasonable fees or commissions charged.
  - 2. A listing of haulers, truckers, or delivery services, not the contractors, including reasonable fees for delivery of said materials or supplies to be included on the project.
- B. A Letter of Intent (Form EEO-DEP-191) for each DBE the bidder intends to use on the project. The Letter of Intent shall include, among other things, a reasonable description of the work the certified DBE is proposing to perform and the prices the certified DBE proposes to charge for the work. A Letter of Intent shall be jointly signed by the certified DBE and the General Contractor who proposes to use them in the performance of the Contract.
- C. Each DBE must also sign and return the DBE Certification of United States Citizenship form to verify that the firm is owned or controlled by a United States citizen.
- D. The SDO “DBE Certification” as prepared by each certified DBE.
- E. A completed Request for Waiver form and backup documentation should the goals not be achieved (See IV below).

### **IV. REQUIREMENTS FOR MODIFICATION OR WAIVERS.**

The bidder shall make every possible effort to meet the minimum requirements of certified DBE participation. If the percentage of DBE participation submitted by the bidder on its Schedule of Participation (EEO-DEP-190) does not meet the minimum requirements, the bid may be rejected by the Awarding Authority and found not to be eligible for award of the contract.

In the event that the bidder is unable to meet the minimum requirements of DBE participation, the bidder shall submit with his/her submittal required in Section III. Requirement of Contract Award a Request for Waiver form (EEO-DEP-490). The Awarding Authority shall review the waiver request to determine if the request should proceed. If approved by the Awarding Authority, the Awarding Authority shall submit the waiver request and supporting documentation, with a recommendation to MassDEP within five days of receipt of the Request for Waiver. MassDEP in conjunction with the project manager, Compliance Unit, will determine whether the waiver will be granted.

The waiver request shall include detailed information as specified below to establish that the bidder has made a good faith effort to comply with the minimum requirements of DBE participation specified in Part I. In addition, the bidder must show that such efforts were undertaken well in advance of the time set for opening of bids to allow adequate response. A waiver request shall include the following:

- A. A detailed record of the effort made to contact and negotiate with the certified DBE, including, but not limited to:
  - 1. names, addresses and telephone numbers of all such companies contacted;
  - 2. copies of written notices(s) which were sent to certified DBE potential subcontractors, prior to bid opening;
  - 3. a detailed statement as to why each subcontractor contacted (i) was not willing to do the job or (ii) was not qualified to perform the work as solicited; and
  - 4. in the case(s) where a negotiated price could not be reached the bidder should detail what efforts were made to reach an agreement on a competitive price;
  - 5. copies of advertisements, dated not less than ten (10) days prior to bid opening, as appearing in general publications, trade-oriented publications, and applicable minority/ women-focused media detailing the opportunities for participation.
- B. MassDEP may require the bidder to produce such additional information as it deems appropriate.
- C. No later than fifteen (15) days after MassDEP receives all required information and documentation, it shall make a decision in writing, whether the waiver is granted and shall provide that determination to the bidder and Awarding Authority. If the waiver request is denied, the facts upon which a denial is based will be set forth in writing. If the waiver request is denied, the bid shall be rejected by the Awarding Authority, or the contract will be determined ineligible for SRF funding.

If a Request for Waiver is denied by MassDEP and the bid is rejected by the Awarding Authority, the Awarding Authority may then move to the second bidder on the project. At the Awarding Authority's discretion, it may collect a DBE package from the third bidder on the project.

## **V. DISADVANTAGED BUSINESS ENTERPRISES PARTICIPATION**

### **A. Reporting Requirements**

1. The Contractor's utilization of certified DBEs will be documented based upon submittal of the LGU's monthly Payment Requisitions as reported on Form-2000. The Form-2000 form will show all certified DBEs performing work on the project regardless of any billing activity for that month. For auditing and accounting purposes, the Contractor periodically may be required to submit copies of canceled checks verifying that payments have been made to the certified DBE as listed on the schedule. The Contractor may also be required to submit current schedules on utilization of all DBEs to indicate when their services will commence and be billed for.
2. During the life of the Contract, the Contractor's fulfillment of the percentage requirements in Part I shall be determined with reference to the Contract price as follows:
  - A. If the price in the Contract executed exceeds the base bid price (e.g., because an alternate was selected or because unit prices were used in awarding the Contract), the Contractor shall submit for approval by MassDEP a revised Schedule of Participation by certified DBEs satisfying the percentage requirements and such other information concerning additional DBE participation as may be requested by MassDEP.
  - B. If the Contract price increases after execution due to change orders or other adjustments, MassDEP may require the Contractor to subcontract additional work or to purchase additional goods and services from certified DBEs up to the percentages stated in Part I.

## **VI. COMPLIANCE**

- A. If the Schedule or any of the Letters of Intent are materially incomplete or not submitted in a timely manner, the LGU may rescind its vote of award; treat the bid informal as to substance and reject the bid. If the bid is incomplete in any other respect than the Schedule the LGU with the approval of MassDEP may waive the informalities upon satisfactory completion of the required information by the Contractor and the certified DBE as applicable.
- B. If the LGU finds that the percentage of certified DBE participation submitted by the contractor on its Schedule does not meet the percentage requirement in Part I, it shall rescind its vote of award and find such contractor not to be eligible for award of the contract.

- C. The Contractor shall not perform with its own organization, or subcontract to any other primary or subcontractor any work designated for the named certified DBEs on the schedule submitted by the Contractor under Part III without the approval of MassDEP.
- D. A Contractor's compliance with the percentage requirement in Part I shall continue to be determined by reference to the required percentage of the total contract price as stated in Section I even though the total of actual contract payments may be greater or less than the bid price.
- E. If the Contractor for reasons beyond its control cannot comply with Part III in accordance with the Schedule submitted under Part III, Section B, the contractor must submit to MassDEP as soon as they are aware of the deficiency, the reason for its inability to comply. Proposed revisions to the Schedule stating how the contractor intends to meet its obligations under these conditions must be submitted within ten (10) working days of notification.
- F. If the Contractor becomes aware by any means that that DBE is no longer certified, the Contractor shall immediately notify MassDEP. The Contractor shall use good faith efforts to retain a substitute certified DBE.
- G. If a certified DBE listed by the bidder in its Schedule of M/WBE contractors fails to obtain a performance or payment bond requested by the bidder, said failure shall not entitle the bidder to avoid the requirements of Part III (A). After a bidder has been awarded the contract, he shall not change the certified DBE listed in its Schedule at the time of the award or make any other such substitutions without the written approval of MassDEP.

## **VII. SANCTIONS**

- A. If the Contractor does not comply with the terms of these Special Provisions, the Awarding Authority may (1) suspend any payment for the work that should have been performed by a certified DBE pursuant to the schedule, or (2) require specific performance of the Contractor's obligation by requiring the Contractor to subcontract with a DBE for any contract or specialty item at the contract price established for that item in the proposal submitted by the Contractor.
- B. To the extent that the Contractor has not complied with the terms of these Special Provisions, the Awarding Authority may retain in connection with Estimates and Payments an amount determined by multiplying the bid price of this contract by the percentage in Section I, less the amount paid to DBE's for work performed under the contract and any payments already suspended under VII A.
- C. The Awarding Authority may suspend, terminate or cancel this contract, in whole or in part, or may call upon the Contractor's surety to perform all terms and conditions in the contract, unless the contractor is able to demonstrate his compliance with the terms

of these Special Provisions, and further deny to the Contractor, the right to participate in any future contracts awarded by the Awarding Authority for a period of up to three years.

- D. In any proceeding involving the imposition of sanctions by the Awarding Authority, no sanctions shall be imposed if the Awarding Authority finds that the contractor has taken every possible measure to comply with these Special Provisions or that some other justifiable reason exists for waiving these Special Provisions in whole or in part.
- E. The contract shall provide such information as is necessary in the judgment of the Awarding Authority to ascertain its compliance with the terms of these Special Provisions.
- F. A contractor shall have the right to request suspension of any sanctions imposed under this section upon demonstrating that he is in compliance with these Special Provisions.

DISADVANTAGED BUSINESS ENTERPRISE PARTICIPATION  
 MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION  
 DIVISION OF MUNICIPAL SERVICES

**SCHEDULE OF PARTICIPATION FOR SRF CONSTRUCTION**

**Project Title:** \_\_\_\_\_ **Project Location:** \_\_\_\_\_

**Disadvantaged Minority Business Enterprise Participation in the SRF Loan Work**

Name & Address of D/MBE	Nature of Participation	Dollar Value of Participation
1.		
2.		
3.		
<b>Total D/MBE Commitment:</b>		<b>\$</b> _____
<b>Percentage D/MBE Participation = (Total D/MBE Commitment) / (Bid Price) =</b>		<b>%</b> _____

**Disadvantaged Women Business Enterprise Participation in the SRF Loan Work**

Name & Address of D/WBE	Nature of Participation	Dollar Value of Participation
1.		
2.		
3.		
<b>Total D/WBE Commitment:</b>		<b>\$</b> _____
<b>Percentage D/WBE Participation = (Total D/WBE Commitment) / ( Bid Price) =</b>		<b>%</b> _____

The Bidder agrees to furnish implementation reports as required by MassDEP to indicate the D/MBEs and D/WBE(s) which it has used or intends to use. Breach of this commitment constitutes a breach of the contract.

Name of Bidder: \_\_\_\_\_

Date: \_\_\_\_\_ By: \_\_\_\_\_  
Signature

NOTE: Participation of a DBE may be counted in only their certified category; the same dollar participation cannot be used in computing the percentage of D/MBE participation and again of D/WBE participation.

**DBE CERTIFICATION OF UNITED STATES CITIZENSHIP**

For the SRF program, under the EPA Disadvantage Business Enterprise (DBE) Rule, a DBE must be owned or controlled by a socially and economically disadvantaged person that is also a **citizen of the United States** (See 40 CFR 33.202). “Ownership” is defined at 13 CFR 124.105 and “control” is defined at 13 CFR 124.106.

DBEs are certified for the SRF program through the Supplier Diversity Office using the federal Department of Transportation (DOT) DBE rules. EPA allows the use of DBEs certified under the DOT rules as long as they are also United States citizens. To ensure compliance with the EPA rule, MassDEP must verify United States citizenship through the completion of the following form for each DBE used on the project.

SRF Project Number \_\_\_\_\_

Contract Number \_\_\_\_\_

Contract Title \_\_\_\_\_

DBE Subcontractor \_\_\_\_\_

The undersigned, on behalf of the above named DBE subcontractor, hereby certifies that the DBE firm is either owned or controlled by a person or persons that are citizens of the United States.

---

CONTRACT ITEM NO.	ITEM OF WORK OR DESCRIPTION OF SERVICES RECEIVED FROM THE PRIME CONTRACTOR	AMOUNT SUBCONTRACTOR WAS PAID BY PRIME CONTRACTOR
<div style="display: flex; justify-content: space-between; align-items: flex-end;"> <div style="width: 45%; border-top: 1px solid black; padding-top: 5px;">Subcontractor Signature</div> <div style="width: 45%; border-top: 1px solid black; padding-top: 5px;">Title/Date</div> </div>		

**REQUEST FOR WAIVER FOR SRF CONSTRUCTION**

Upon exhausting all known sources and making every possible effort to meet the minimum requirements for DBE participation, the Bidder may seek relief either partially or entirely from these requirements by submitting a completed waiver package by the close of business on the third business day after notification by the LGU. Failure to comply with this process shall be cause to reject the bid thereby rendering the Bidder not eligible for award of the contract.

**General Information**

Project Title: \_\_\_\_\_ Project Location: \_\_\_\_\_  
Bid Opening (time/date) \_\_\_\_\_  
Bidder: \_\_\_\_\_  
Mailing Address: \_\_\_\_\_  
Contact Person: \_\_\_\_\_ Telephone No. \_\_\_\_\_

**Minimum Requirements**

The bidder must demonstrate that good faith efforts were undertaken to comply with the percentage goals as specified. The firm seeking relief must show that such efforts were taken appropriately in advance of the time set for opening bid proposals to allow adequate time for response(s) by submitting the following:

- A. A detailed record of the effort made to contact and negotiate with disadvantaged minority and/or woman owned businesses, including:
  - 1. names, addresses, telephone numbers and contact dates of all such companies contacted;
  - 2. copies of written notice(s) which were sent to DBE potential subcontractors prior to bid opening;
  - 3. a detailed statement as to why each subcontractor contacted (i) was not willing to do the job or (ii) was not qualified to perform the work as solicited; and
  - 4. in the case(s) where a negotiated price could not be reached the bidder should detail what efforts were made to reach an agreement on a competitive price.
  - 5. copies of advertisements, dated not less than ten (10) days prior to bid opening, as appearing in general publications, trade-oriented publications, and applicable minority/women-focused media detailing the opportunities for participation;

- B. MassDEP may require the bidder to produce such additional information as it deems appropriate.
- C. No later than fifteen (15) days after submission of all required information and documentation, MassDEP shall make a determination, in writing, whether the waiver request is granted and shall provide that determination to the bidder and Awarding Authority. If the waiver request is denied, the facts upon which a denial is based will be set forth in writing.

CERTIFICATION

The undersigned herewith certifies that the above information and appropriate attachments are true and accurate to the best of my knowledge and that I have been authorized to act on behalf of the bidder in this matter.

DATE

## APPENDIX F

### DEPARTMENT OF ENVIRONMENTAL PROTECTION BUREAU OF WATER RESOURCES DIVISION OF MUNICIPAL SERVICES POLICIES

The Division of Municipal Services (DMS) has established the following policies for all Division financially-assisted projects.

#### **POLICY MEMORANDUM NO. PM-1**

#### **EASEMENTS AND RIGHTS OF WAY**

Prior to the approval of financial assistance for construction, the owner shall obtain and shall thereafter retain, a fee simple or such estate or interest in the site of construction and rights of access as will assure undisturbed use and possession for the purpose of construction and operation for the estimated life of the project. The Division may refuse to approve financial assistance until it has received from the owner sufficient assurances that such interests have been obtained. Unless the Division otherwise notifies the owner, the certificate (under pains and penalties of perjury) of the owner's legal representative shall constitute such sufficient assurance.

Additional cost which result from interruptions of construction or extensions of contract time caused by the owner's failure to obtain the necessary interests in land shall be ineligible for financial assistance, and all such additional costs shall be borne by the owner.

#### **POLICY MEMORANDUM NO. PM-2**

#### **PERMITS**

The owner shall be responsible for identifying and obtaining all federal, state, local and railroad permits required by the nature and location of construction, including but not limited to building construction permits and permits for street and highway cuts and openings, and all such permits shall be listed in a separate permits section of the contract documents. To the extent possible, such permits shall be obtained by the owner prior to the solicitation of bids for construction, and copies of all permits so obtained shall be included in the said permits section. The status of the application for each permit, including the permit conditions, and costs, not obtained prior to the solicitation of bids shall also be indicated in the contract documents permits section. The Division may refuse to approve financial assistance for construction unless and until it has received from the owner sufficient assurances that all necessary permits have been or will be obtained prior to the commencement of construction.

Policy Memorandum No. PM-2 – Permits (Con't)

The contractor shall be responsible for obtaining all permits required of his equipment, work force, or particular operations (such as blasting) in the performance of the contract and not otherwise specified in the two preceding paragraphs as to be obtained by the owner. These permit fees shall be paid by the contractor.

The owner shall be responsible for the payment of all other permit fees required by the construction.

The following permits shall not be eligible for financial participation by the Department of Environmental Protection (DEP).

- Permits and insurance for construction in railroads' rights of way;
- Building permits;
- Permits for opening public streets and other public or municipal rights of way;
- Permits for the use of explosives;
- Permits for the disposal of waste materials;
- Permits and fees for connecting to municipal utilities.

Permits required by extraordinary circumstances and not specifically excluded from eligibility above may be eligible for DEP participation. For such permits to be so eligible, the owner or his representative must notify the DEP project engineer in advance of obtaining such permit and receive from the engineer specific agreement that such permit will be eligible for DEP participation. Eligibility for such participation will not be made retroactively.

Additional costs which result from interruptions of construction or extensions of contract time resulting from the owner's or the contractor's failure to obtain the necessary permits may be ineligible for participation.

**POLICY MEMORANDUM NO. PM-3**

**FIELD CONTROLS**

The Owner shall be responsible for indicating on the contract drawings all easement limits and all property and other control lines for locating the principal component parts of the work together with those elevations and bench marks used in the design of the work, all hereinafter referred to as "field controls". Where easement and property limits have not previously been established in the field, the owner shall be responsible for establishment of such limits. From the information provided by the Owner, unless otherwise specified, the Contractor shall develop and make all layouts required for construction, such as slope stakes, batter boards, stakes for pipe locations and other working points, lines, elevations and cut sheets.

Whenever he has reason to believe that an error exists or whenever he is otherwise unable to locate the field controls, the contractor shall promptly notify the owner and the owner's engineer of such error with appropriate documentation.

**POLICY MEMORANDUM NO. PM-4****RECORD DRAWINGS**

The Owner shall be responsible for the preparation of all record drawings required by this contract. This responsibility may be delegated to the Owner's representative. The responsibility for preparation of record drawings shall not be delegated or transferred to the contractor. They may use the contractor's and sub-contractor's certified AS BUILT drawings along with their own marked up set in the preparation of the Record Drawings.

Division approved contract drawings shall be revised upon completion of the contract to reflect any changes made and/or final quantities, as appropriate.

**POLICY MEMORANDUM NO. PM-5****PLAN SCALE**

Unless otherwise approved in advance by the Division, the horizontal scale for construction plans for non-structural facilities shall be 1" = 40'. A larger horizontal scale shall be used where appropriate to show sufficient detail to construct the project. The vertical scale for construction plans for non-structural facilities shall be 1" = 4'. Based on the best information available at the time of their preparation, the location of underground utilities and support structures for overhead utilities shall be shown on the plans.

Unless otherwise exempted in advance by the Division, construction plans shall be updated whenever the date of the advertisement for bids for the construction of such facilities is more than one year after the date of approval by the Division or EPA; and in the case of approval by both such agencies, the later approval date shall be used in determining the need for update.

The consulting engineer shall receive adequate compensation for updating plans and specifications, and such additional cost shall be eligible for assistance to the extent not otherwise prohibited by USEPA and Division regulations and program guidance.

All revision, or review without need for revision, shall be noted and dated on the plans prior to advertisement of the project for bid.

**POLICY MEMORANDUM NO. PM-6****BORINGS LOGS**

All soil borings shall be taken as close as practicable to the construction line, and the location of all such borings shall be clearly indicated on the contract drawings. The plan view shall show the location and boring number of each boring. The profile view shall show the location, elevation, and depth of each soil boring, the location of each change in soil stratum, the groundwater level, and the average of blow counts at each five foot interval. As a minimum, boring logs to be submitted with the plans and specifications shall show the name of the company taking the borings, the soil classification, the number of blows per foot of penetration, the groundwater elevation, and the date on which the borings were taken.

As part of the submission of plans and specification for approval, the owner's representative shall include written justification for the lesser frequency and depth of borings where their interval is more than approximately 300' or their depth is less than 50% below depth of pipe invert.

**POLICY MEMORANDUM NO. PM-7**

**BREAKDOWN OF BID ITEMS**

The following items shall, where applicable, be listed separately in the bid documents.

- 1. Mobilization
- 2. Pavement
  - a. Municipal
    - i. temporary
    - ii. permanent
  - b. State
    - i. temporary
    - ii. permanent
- 3. Concrete cradle or encasement  
(to be identified where applicable)
- 4. Rock-Excavation
- 5. Wood or steel sheeting left in place
- 6. Excavation of unsuitable materials below grade.
- 7. Select and/or borrow material
- 8. Dewatering
- 9. Special Dewatering (coffer dam)

Mobilization costs are the costs of initiating the contract, exclusive of the cost of materials. Payment for mobilization shall be a lump sum at the price bid for this item in the proposal and shall be payable when the contractor is operational on the site. For purposes of this policy, “operational” shall mean the substantial commencement of work on site.

The lump sum price bid for mobilization shall not exceed five per centum (5%) of the total amount of the bid.

**POLICY MEMORANDUM NO. PM-8**

**PAVEMENT**

All roads and trenches therein shall be refilled and repaved in accordance with specifications provided by the owner in the contract documents. Please note that this policy may be excludable on federally assisted projects where bid alternative items may be required (i.e. trench width vs. full width pavement). You are advised to seek project specific clarification.

Loan eligibility shall be limited to the following:

- A. Where the depth of the pipe invert is 0 to 8’, the maximum pavement widths which shall be eligible for financial assistance are as follows:

<u>Nominal Pipe Diameter</u>	<u>Maximum Eligible Widths</u>	
	<u>Initial Pavement</u>	<u>Permanent Trench</u>
0-24”	6’-6”	8’-6”

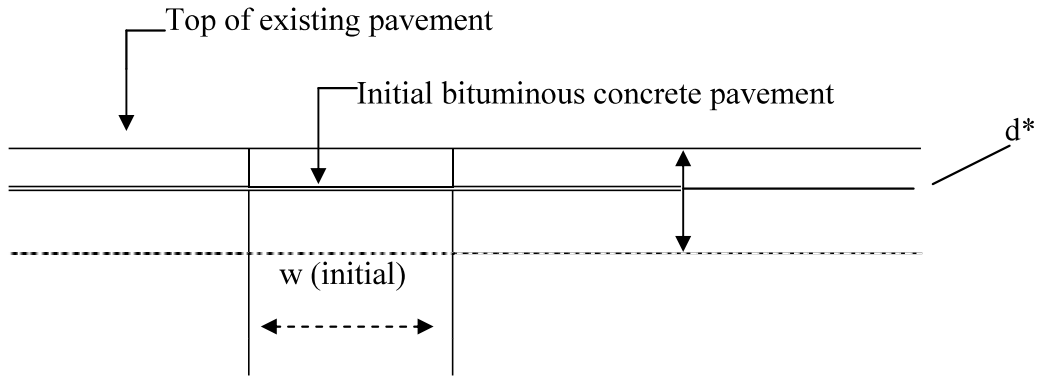

Where the nominal pipe diameter is greater than 24” the maximum eligible width for initial re-paving shall be the nominal diameter of the pipe plus four (4) feet, and for permanent trench re-paving the maximum eligible width shall be the nominal pipe diameter plus six (6) feet.

- B. For each additional four (4) feet (or fraction thereof) of pipe invert depth, add three feet to the eligible width limits stated in paragraph A.

Policy Memorandum No. PM-8 – Pavement (Con't)

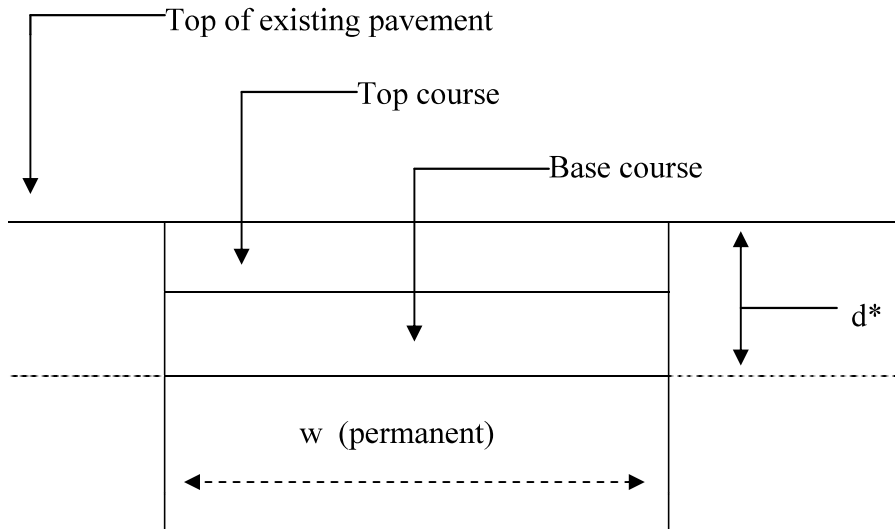

At the design phase of a project the owner has the option to elect either Initial Pavement with Option I (Permanent Trench replacement) or Initial with Option II (curb to curb over initial)

Initial Pavement

d\* = depth of existing pavement to a maximum of 3 inches (see general notes #3)  
w = maximum eligible Initial pavement width as described in paragraphs “A” & “B” on page DEP-DMS-CG’s-P4.

OPTION I Permanent Trench Pavement

d\* = depth of existing pavement trench to a maximum of 3 inches (see general notes #3)  
w = maximum eligible permanent pavement width as described in paragraphs “A” & “B”.  
equals initial width plus 2 feet and includes:

- Cutting edges for the permanent trench
- Removal of initial patch plus two feet of existing pavement
- Fine grading/compacting gravel
- Placement of Permanent Trench pavement in two courses.

OPTION II Curb to Curb Pavement (overlay pavement for roadways up to 28 feet)

E.R.= edge of existing paved roadway

t = one and one half inch (1 1/2") overlay of bituminous concrete pavement

GENERAL NOTES:

1. Repavement of settled areas and crown restoration within the trench limits shall be the responsibility of the contractor.
2. Leveling outside the trench limits shall be the responsibility of the owner.
3. Sewer trench re-fill and pavement re-paving on public ways under the jurisdiction of the Massachusetts Department of Public Works, the Metropolitan District Commission, or other such agency shall be in accordance with permit(s) issued therefore by that Department or Commission, as the case may be.
4. The Division will consider requests for increase in the participating pay limits defined in paragraphs A and B, when such increases are, in the Division's opinion, reasonable. Such requests should be documented in writing and submitted to the Division in a timely manner.
5. Projects which deviate from the above options are required to seek Division review and approval.

**POLICY MEMORANDUM NO. PM-9**

**PIPE TESTING**

Monthly payment estimates shall be prepared in accordance with contract documents. All pipe shall be tested in accordance with the contract documents and sound engineering practice. If, after 60 days following submission of a monthly payment estimate for pipe items, the pipe for which payment is requested has not been successfully tested, the owner may withhold up to 10% of the amount requested for such pipe items until the pipe has been so tested. However, in the case of a major (pipe diameter 24 inches or greater) interceptor pipe installation, sums retained by the owner pursuant to this policy memorandum shall not exceed two per centum (2%) of the costs of such pipe items.

**POLICY MEMORANDUM NO. PM-10**

**CHANGE ORDERS**

Executed change orders submitted to the Division for review and processing for financial assistance must be prepared on the attached Change Order Forms (PM-10, Attachment 1, pages A-1 & A-2) with a duplicate copy, calculation sheet(s) (PM-10, Attachment 2), and all other supporting documentation necessary for evaluation. Failure to comply with these instructions will result in delays in processing the change order and/or limited financial assistance.

M.G.L. c.44, s.31C requires that the auditor, accountant, or other municipal officer having similar duties must certify that adequate funding in an amount sufficient to cover the total cost of the change order has been made. Change orders will not be processed or approved until this certification is made on the face of the Change Order Form (PM-10 Attachment 1).

Payment of Change Orders:

Payment of all change orders shall be in accordance with the relevant provisions of Massachusetts General laws, Chapter 30, Section 39G for non-building construction and Section 39K for building construction.

Payment of change orders shall be made in accordance with one of the following three methods:

- A. Existing unit prices as set forth in the contract; or
  - B. Agreed upon lump sum or unit prices; or
  - C. Time and materials
- A. Payment for work for which there is a unit price in the contract:

Where the contract contains a unit price for work and the Engineer orders a change for work of the same kind as other work contained in the contract and is performed under similar physical conditions, the contractor may accept full and final payment at the contract unit price(s) for the acceptable quantities.

Policy Memorandum No. PM-10 – Change Orders (Con't)

B. Payment for work or materials for which no price is contained in the contract:

If the Engineer directs, the contractor shall submit promptly in writing to the Engineer and offer to do the required work on a lump sum or unit price basis, as specified by the Engineer. The stated price, either lump sum or unit price, shall be divided so as to show that it is the sum of:

- (1) The estimated cost of labor, plus
- (2) Direct Labor Cost, plus
- (3) Material and Freight Costs, plus
- (4) Equipment Costs, plus
- (5) An amount not to exceed 20% of the sum of items (1) through (4) for overhead and profit, plus (if applicable),
- (6) In the case of work done by a subcontractor an amount not to exceed 7 ½ %, for the general contractor of the sum of items (1) through (4) for his overhead and profit, less, if applicable,
- (7) Credits for work deleted from the contract.

C. Payment for work on a time and materials basis:

Unless an agreed lump sum and/or unit price is obtained from above and is so stated in the change price, the contractor shall accept as full payment for which no other agreement is contained in contract, and amount equal to:

- (1) The estimated cost of Labor, plus
- (2) Direct Labor Cost, plus
- (3) Material and Freight Costs, plus
- (4) Equipment Costs, plus
- (5) An amount not to exceed 20% of the sum of items (1) through (4) for overhead and profit, plus (if applicable),
- (6) In the case of work done by a subcontractor an amount not to exceed 7 ½ %, for the general contractor of the sum of items (1) through (4) for his overhead and profit, less, if applicable,
- (7) Credits for work deleted from the contract.

Explanation of items (1) through (7) as outlined in “B” and “C”:

- (1) Labor – Only those workers employed on the project who are doing the extra work, including the foreman in charge, are allowable. General foremen, superintendents, or other supervisory personnel are considered to be included in the overhead markup as provided in items (5) and/or (6). Hourly labor rates in excess of those as listed in the contract wage rates (Federal or State, whichever applies) require documentation. As a minimum, an explanation and the appropriate copy of the certified payroll are required.

Policy Memorandum No. PM-10 – Change Orders (Con't)

- (4) Equipment – Only the equipment required as a result of the change order is allowable. Equipment rental rates shall be governed by the current Nielson/Dataquest Rental Rate bluebook for Construction Equipment (the “Bluebook”). In determining the rental rate the following shall apply:
- (a) For equipment already on the project – the monthly prorated rental rate by the hourly use shall be applicable;
  - (b) For equipment not on the project the daily rate, the weekly rate, or monthly rate will prevail, whichever will prove to be most cost effective. Small tools and manual equipment are examples of costs not allowable under this item. These costs are considered to be included in the overhead markup as provided in items (5) and/or (6) (1 month (normal use) = 176 hours)
- (5) & (6) Overhead and Profit – All other costs not previously mentioned are considered to be included in this item, be it for the general contractor or subcontractor(s).
- (7) Credits – Work deleted, material and equipment removed from the contractor, stored and/or returned shall be credited to the cost of the change order, less costs.

The Contractor shall furnish itemized statements of the cost of the work ordered and shall give the Engineer access to all accounts, bills and vouchers relating thereto; and unless the Contractor shall furnish such itemized statements, and access to all accounts, bills and vouchers, he shall not be entitled to payment for any items of extra work for which such information is sought by the Engineer. Deviations from any of the above will be reviewed for financial assistance on a case-by-case basis.

The change order will be prepared in such manner as to clearly separate Eligible and Ineligible Costs.

-----------------

Total Cost      \$ 5,296.00

Reminder:      Provide support documentation as necessary i.e. vouchers, correspondence,  
Calculation, photographs, reports .....

**POLICY MEMORANDUM NO. PM-11**

**UTILITY RELOCATION**

The construction of treatment facilities, sewers, pumping stations, force mains and appurtenant work can cause the relocation of utilities. Costly relocation can sometimes be minimized by early communication and cooperation of the representatives of the municipality (owner) and the utilities.

Every possible effort should be made by the owner and each utility to establish the location of existing utilities in the vicinity of the proposed construction. The owner or its consulting engineer should make every reasonable effort to design the proposed construction so that relocation of existing utilities is minimized whenever possible. If the proposed construction is in an area of many existing utilities or in an otherwise critical area, the utilities are encouraged to mark the location of their existing utilities at the site during the design phase of the project.

During the design phase of the project, the municipality should provide timely notice to all utilities known or thought to have facilities in or proximate to the site of such future construction.

**POLICY MEMORANDUM NO. PM-12**

**REFUNDABLE DEPOSITS FOR PLANS AND SPECIFICATIONS**

For each set of project plans and specifications provided, the owner may require a deposit in form of cash or other appropriate security, in an amount sufficient to cover the costs of production of such plans and specifications.

Upon return of the plans and specifications to the owner within a reasonable time and in good condition, such deposit shall be refunded.

Actual mailing costs, if any, shall be borne by the party requesting such plans and specifications.

**POLICY MEMORANDUM NO. PM-13**

**BID OPENING PROCEDURES**

As a minimum, bid documents shall be reviewed/inspected for conformance to the following bid opening procedure in the order presented below. Failure to comply with any of these steps shall render the bid non-responsive and upon determination of such non-responsiveness, such bid shall be rejected immediately, set aside, and shall receive no further consideration.

**Bid Opening Procedure**

Step #1. Timeliness – The bid must be filed at the place and within the time specified therefore in the invitation to bid, and no bid shall be accepted after such time. The time at which a bid is filed should be time/date stamped or otherwise prominently noted on the bid;

Policy Memorandum No. PM-13 – Bid Opening Procedures (Con't)

Step #2. Bid Security – Properly executed bid security, in the amount and terms specified in the invitation to bid (equal to 5% of Base Bid or Highest Possible Amount considering all alternatives) shall be placed in a seal envelope and attached to the outside of the envelope containing the bid at the time of its submission;

A. Bid Bond

The Bid bond must be dated On or Before the Bid Date;  
Issued by a Bonding Company Licensed in Massachusetts;  
Accompanied by a Current Power of Attorney;  
Signed by Surety;

B. Check

The Check must be a Certified, Cashiers or Bank Treasurer's;  
Dated On or Before the Bid Date;

Step #3. Bid Signature – The bid and all accompanying documents so required shall be signed by the bidder or its authorized representative before submission;

Step #4. Addenda – All addenda shall be sent certified mail, return receipt requested, by the owner to all individuals and organizations which have received plans and specifications and shall be mailed not later than five days prior to the date established for submission of bids. All bidders shall include with their bids written acknowledgement of receipt of all addenda, which acknowledgement may be on a form provided therefore by the owner.

Alternates – Any Alternates shall be acknowledged.

Step #5. Written Dollar Amounts – The total dollar amount of each bid shall be read, and the three lowest bids shall be selected for further consideration. The remaining bids shall then be set aside. The three apparent low bids shall be read to determine whether the unit price for each line item of each bid has been written therein in words. If it has not, such bid shall be rejected and shall receive no further consideration. ***Bid amounts shall be consistent (words vs. numbers) and if words and numbers differ, the words govern.*** This procedure shall then be repeated with the next apparent low bid until three are acceptable which have all the unit prices written in words, at which time the lowest bid shall be announced as the apparent low bidder, and the bid opening procedure shall be closed.

The Division recommends that this policy memorandum be included in all contract specifications and that the owner's evaluator(s) use the attached form (PM-13 Attachment 1) for bid opening procedures.

The Contractor's Bid Opening Checklist also attached hereto, is for use by each contractor to assure that his bid conforms with this policy memorandum. It is recommended that the checklist (PM-13 Attachment 2) be included in information for bidders, or at the end of the bid proposal, or in some other prominent part of the bid specifications

**FORM FOR BID OPENING PROCEDURES**

CONTRACTORS CHECKLIST**

CONTRACT NO.: \_\_\_\_\_ BIDDER: \_\_\_\_\_ DATE: \_\_\_\_\_

All non-responsive bids shall be rejected forthwith by the awarding authority upon determination of such bids' non-responsiveness at the time bids are opened and read. Failure to comply with one or more of the following requirements shall render the bid non-responsive, and upon determination of such non-responsiveness such bid shall be rejected and receive no further consideration.

ITEM	REQUIREMENTS	COMPLIANCE (CIRCLE 1)		REASONS FOR REJECTION
		Yes	No; Rejected	
1. Timeliness	Bid filed w/in time specified	Yes	No; Rejected	
2. Bid Security	Appropriate and properly Executed security w/bid.	Yes	No; Rejected	
3. Signature	Bid signed by authorized Representative	Yes	No; Rejected	
4. Addenda	All addenda acknowledge Any alternative	Yes	No; Rejected	
5. Dollar Amount	Dollar amount in words Specified for each line item in bid	Yes	No; Rejected	

There shall be in the contract documents a separate pay item for rock excavation. For such purposes, “rock” shall mean igneous, sedimentary, metamorphic, and conglomerate rock, which for excavation must be drilled, blasted, broken, or ripped by power tools. Boulders and concrete structures one cubic yard or greater, however removed, are included within this definition of rock for payment purposes. At the option of the owner or his representative a separate pay item for boulders, concrete structures, or concrete road base may be used.

<u>Depth From Ground Surface</u> <u>To Invert Pipe</u>	<u>Pay Width</u> <u>(Nominal Pipe Diameter)</u>	
* 0 – 12’	<u>0-24”</u>	<u>Over 24”</u>
* Over 12’ – 20’	5’0”	D+3’0”
	7’0”	D+5’

Engineer’s plans and specifications shall establish pay limits below pipe and structures.

- See PM-14 Attachment 1 (typical cross section)

Payment width for depths over twenty feet (20’) shall be determined on a case-by-case basis consistent with the foregoing chart.

The pay limit for rock removal outside proposed manholes shall commence one foot (1’) outside the widest dimension of the structure of shall be the maximum connecting trench width, whichever is greater.

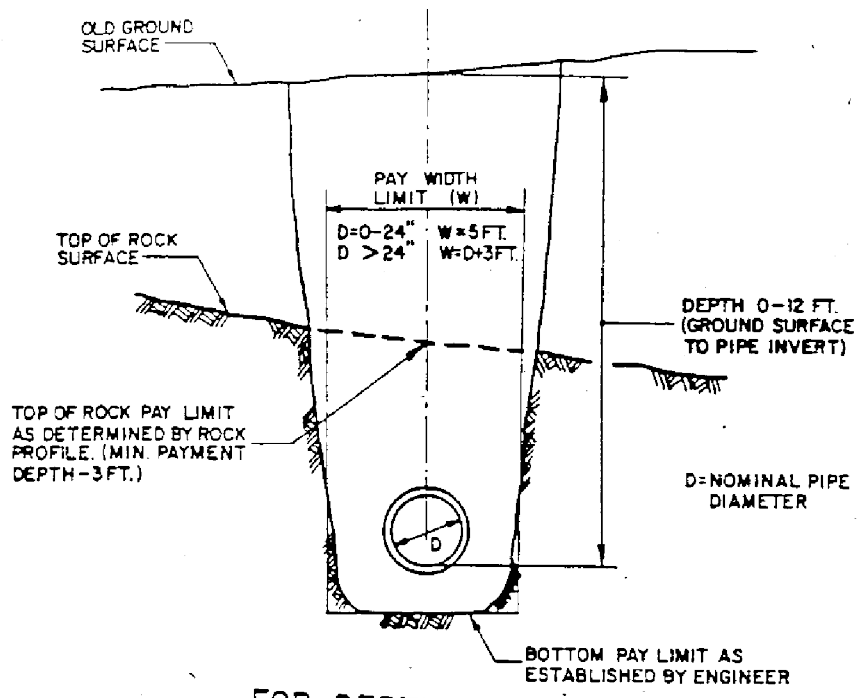

Payment depth for rock which is encountered in a trench shall be no less than three feet (3’) when removal can be accomplished only by drilling and blasting or by use of jack (air or hydraulic) hammers.

Payment for rock removed, using the same or equal equipment as utilized for normal trench excavation, shall be limited to the actual depth removed within the limits established by the contract documents.

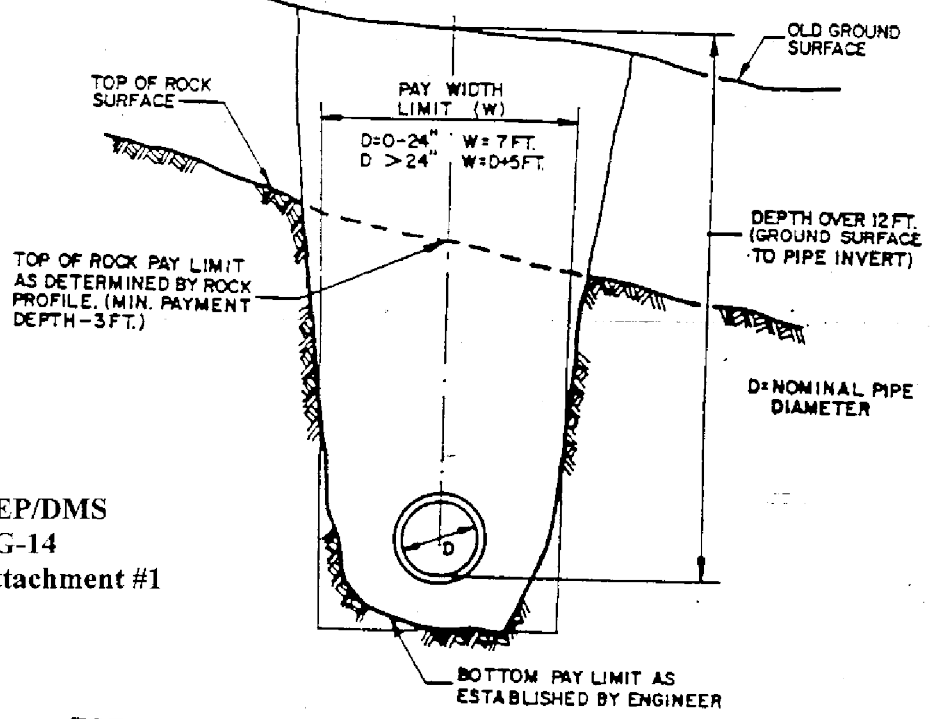

Boulders encountered within the pay limits of excavation, whose volume is one cubic yard or greater, part of which extends outside said limits shall be paid in accordance with the actual volume excavated.

# CG-14 ROCK EXCAVATION

FOR DEPTH 0 TO 12 FEET

FOR DEPTH OVER 12 FEET AND UP TO 20 FEET

DEP/DMS  
CG-14  
Attachment #1

**POLICY MEMORANDUM NO. PM-15**

**TRAFFIC POLICE**

The reasonable costs for police details required for traffic control on a construction project which receives financial assistance shall be considered as an eligible administrative cost. A police detail item shall not be included as a bid item in the contract documents.

“Police” as used in this memorandum includes local, county, capital, state, regular and auxiliary police.

Owner’s Responsibility

It shall be the owner’s responsibility to submit in writing the hourly rate of pay to be established for detailed traffic police and each change in rate during the course of the project. It is the owner’s responsibility to arrange, document and pay for such police details. The owner or its representative shall meet with the police chief or other officer in charge of police detail duty to review contract needs. The owner shall maintain a daily record of the following:

- a. Officer’s name
- b. Hours worked
- c. Location of assignment
- d. Hourly rate

**POLICY MEMORANDUM NO. PM-16      DOCUMENTATION REQUIRED TO  
SUBSTANTIATE CONTRACT QUANTITIES**

<u>Unit</u>	<u>Documentation required</u>
Acres (A)	Location, station, offset and calculations. Location = Street right-of-way, etc; Station = Point on Baseline; Offset = Distance left or right of Baseline
Cubic Yard (C.Y.)	Location, stations, widths, depths, calculations and Cross sections as necessary
Each (Ea.)	Location, station, and offset.
Gallon (Gal.)	Location, stations, calculations (if appropriate) and delivery slips.
Hour (Hr.)	Hours and location.
Linear Feet (L.F.)	Location, stations, and offsets.
Month (Mo.)	Location, period of time and calculations if applicable.

1000 Foot Board Measure (MFBM)	Location, stations, offset, elevations, grade, and calculations.  Attach invoices where applicable.
Pound (Lb.)	Locations, stations, and calculations (if applicable). Attach Delivery weight slips.
Square Feet (S.F.)	Locations, stations and calculations
Square Yard (S.Y.)	Locations, stations and calculations
Ton	Locations, stations and calculations (if applicable). Attach Delivery weight slips.
Vertical Feet (V.F.)	Locations, stations, elevations, and offsets.

Note:

1. All of the above, that apply must be submitted with a final payment request or change order as applicable.
2. Where in place measurement is not possible or practical, delivery slips may be used to substantiate quantities.
3. Change orders – See PM-10 in which some of the above may be applicable in justifying materials, equipment and labor.
4. When necessary, itemized quantities must be separated into eligible and non-eligible units with separate calculations to justify eligible costs.
5. Overruns and underruns of any specific item shall be explained with an appropriate sentence or paragraph.
6. On all quantities, units of payment shall be maintained at the project site and shall be updated daily so that upon field inspection by the C.O.E., EPA or DMS, the quantities paid to date can be substantiated.
7. In the case of unforeseen conditions, photos should be submitted with the applicable item in addition to the recommended documentation.
8. Documentation of units of payment shall be clearly legible and cross referenced to the applicable sheets of the record drawings.
9. For record drawings policy, please see PM-4.

---

DMS Policies 1 through 16 Approved By:

Steven J. McCurdy  
Division of Municipal Services

**DWS POLICY 88-02**  
**DEPARTMENT OF ENVIRONMENTAL PROTECTION**  
**POLICY FOR REVIEW OF SEWER LINE/WATER SUPPLY PROTECTION**

The Department of Environmental Protection seeks to protect existing and potential water supplies from the potentially negative effects of leaking sewer lines through the adoption of a Department policy on this subject.

The following restrictions will apply to new sewer construction statewide:

Gravel Packed Wells

- ~ Within the 400 foot radius protective distance around gravel packed wells, all sewer lines and appurtenances are prohibited, unless they are necessary to eliminate existing and/or potential sources of pollution to the well.

Tubular Wells

- ~ Within the 250 foot radius protective distance around tubular wells, all sewer lines and appurtenances are prohibited, unless they are necessary to eliminate existing and/or potential sources of pollution to the well.

Gravel Packed and Tubular Wells

- ~ Within a minimum radius of 2,640 feet or unless otherwise documented by an appropriate study specifically defining the area of influence and approved by the Division of Water Supply, all sewer lines and appurtenances will be designed and constructed for maximum water tightness.
- Force Mains or Pressure Sewers: shall be tested at 150% above maximum operating pressure or 150 p.s.i. whichever is greater. Testing shall conform to the requirements of the American Water works Association (AWWA) standard c 600.
- Gravity Sewers: shall be tested by approved methods which will achieve test results for infiltration or exfiltration of less than 100 gallons/inch diameter/mile/24 hours.
- Manholes: shall be installed with watertight covers with locking or bolted and gasketed assemblies. Testing for infiltration/exfiltration shall conform to the same standards as the maximum allowed for pipes in the manhole as required for gravity sewers, indicated above.
- Satisfactory test results for Force Mains, Manholes and Gravity Sewers shall be performed prior to the expiration of the contractor's one year guarantee period.
- All pumping stations within this zone shall have standby power high water alarms telemetered to an appropriated location that is manned at all times. An emergency contingency plan must be developed by the owner and approved by the BWR.
- A minimum of Class B bedding as defined by WPCF-MOP9 must be used for all piping.
- Service connections (laterals and house connections) shall be rigidly inspected by the appropriate municipal official. Certified inspection reports shall be submitted to the BWR.

### Bedrock Wells

The above requirements are the same for bedrock wells, with the Department reserving the right to require more stringent controls on a case-by-case basis.

### Surface Water Supplies

- ~ Within 100 feet of all surface water supplies and tributaries all sewer lines and appurtenances are prohibited except as required to cross tributaries or to eliminate existing or potential pollution to the water supply. In the latter case, watertight construction methods shall be use.
- ~ Tributary stream crossings shall employ watertight construction methods of sewer lines and manholes. Watertight construction must extend 100 feet to either side of the stream.
- ~ Within 1,000 feet of surface water supplies and tributaries, all pumping stations shall have standby power and high water alarms telemetered to an appropriate location that is manned at all times. An emergency contingency plan must be developed by the owner of the wastewater treatment facility and submitted to the BWR for approval.
- ~ Beyond 1,000 feet and within the watershed of surface water supplies the Department may in specific circumstances after review, require additional controls.

### Potential Public Water Supplies

The above requirements also apply to potential public water supplies.

### Baseline Date Requirements

Two (2) copies of an appropriately scaled map(s) shall be submitted to the Department which details the proposed sewers and/or appurtenances and also includes the following:

- (1) the location of all nearby existing or potential surface water supplies, tributaries thereto, and watershed boundaries;
- (2) the location of existing and potential public and municipal potable groundwater supply wells.

The Department reserves the right to impose more restrictive measures than those contained in this policy as deemed appropriate.

### Definitions

- Appurtenances – all attachments to sewer lines necessary for the transport and operation and maintenance of sewer lines, including manholes, pumping station, siphons, etc.
- Area of influence – that area of an aquifer which contributes water to a well under the most severe recharge and pumping condition that can be realistically anticipated (i.e. pumping at the safe yield of the well for 180 days without any natural recharge occurring). It is bounded by the groundwater divides which result from pumping the well and by the contact of the edge of the aquifer with less permeable materials such as till and bedrock. At some locations, streams and lakes may form recharge boundaries.
- Potential public water supply – areas designated by communities for water supply purposes where land has been set aside and Department approved pump tests conducted and surface water supplies as defined below.
- Surface Water Supply – Waters classified as Class A by the DWPC.
- Public Water Supply Systems – as defined in 310 CMR 22.02 (DEP Drinking Water Regulations).
- Class B Bedding – as defined in WPCF Manual of Practice No. 9.

APPROVED: (Signature on File)

Shaped bottom with tamped backfill,  
load factor 1.9

Compacted granular bedding,  
load factor 1.9

**Class B---First-Class Bedding** – Class B bedding may be achieved by either of two construction methods:

- a. **Shaped Bottom with Tamped Backfill.** The bottom of the trench excavation shall be shaped to conform to a cylindrical surface with a radius at least 2 in. (5 cm) greater than the radius to the outside of the pipe and with a width sufficient to allow six-tenths of the width of the pipe barrel to be bedded in fine granular fill placed in the shaped excavation. Carefully compacted backfill shall be placed at the sides of the pipe to a thickness of at least 12 in. (30 cm) above the top of the pipe. Shaped trench bottoms are difficult to achieve under current construction conditions.
- b. **Compacted Granular Bedding with Tamped Backfill.** The pipe shall be bedded in compacted granular material placed on a flat trench bottom. The granular bedding shall have a minimum thickness of one-fourth the outside pipe diameter and shall extend halfway up the pipe barrel at the sides. The remainder of the side fills and a minimum depth of 12 in. (30 cm) over the top of the pipe shall be filled with carefully compacted material.

## Investing In America Signage Guidelines

The Bipartisan Infrastructure Law

The CHIPS and Science Act

The Inflation Reduction Act

The American Rescue Plan

## Guidelines for Logo Applications

The purpose of this document is to provide general guidelines for signs displayed at project sites for projects funded under the Bipartisan Infrastructure Law (also known as the Infrastructure Investment and Jobs Act), the CHIPS and Science Act, the Inflation Reduction Act, the American Rescue Plan, and other Federally-funded projects as appropriate. The first part of this document pertains to signs for Federally-funded projects that are not installed in the highway right-of-way. For highway signage guidance that is MUTCD compliant please see pages 13 and 14. For all other signs please start here. This document provides information about the Investing In America logo mark as well as how logos, marks and seals of states, cities, and counties can be incorporated into signage. Logos of contractors are not permitted on the signage. When logos are included in signage, the placement should conform to these brand guidelines.

## Variations and Usage

There is one approved mark associated with the Investing In America logo. To preserve the integrity of the Investing In America logo mark, make sure to apply them correctly. Altering, distorting, or recreating the 'marks' in any way weakens the power of the image and what it represents. Layout and design of signs and communication materials will vary, so care must be taken when applying the logo mark.

## Primary Logo Mark

## Build America, Buy America (BABA) Requirements

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY  
WASHINGTON, D.C. 20460

OFFICE OF WATER

November 3, 2022

### MEMORANDUM

**SUBJECT:** Build America, Buy America Act Implementation Procedures for EPA Office of Water Federal Financial Assistance Programs

**FROM:** RadhikaFox  
Assistant Administrator 

**TO:** EPA Regional Water Division Directors, Regions I - X  
EPA Office of Water Office Directors

### OVERVIEW

The Biden-Harris Administration recognized the Nation's critical need for infrastructure investment, championing the Bipartisan Infrastructure Law (BIL), which Congress passed on November 15, 2021 (also known as the Infrastructure Investment and Jobs Act (IIJA)). The BIL will provide an unprecedented level of federal investment in water and wastewater infrastructure in communities across America.

In Title IX of the IIJA, Congress passed the Build America, Buy America (BABA) Act, which establishes strong and permanent domestic sourcing requirements across all Federal financial assistance programs for infrastructure. The U.S. Environmental Protection Agency (EPA) Office of Water is honored to help lead the implementation of these provisions and is proud of its near decade of successful implementation of the American Iron and Steel (AIS) provisions for its flagship water infrastructure programs.

This is a transformational opportunity to build a resilient supply chain and manufacturing base for critical products here in the United States that will spur investment in good-paying American manufacturing jobs and businesses. EPA's efforts to implement BABA will help cultivate the domestic manufacturing base for a wide range of products commonly used across the water sector but not currently made domestically. This will take time, and flexibility will be important to ensure that EPA can leverage critical water investments on time and on budget to protect public health and improve water quality.

## IMPLEMENTATION

Recognizing the opportunity and need for BABA implementation guidance, the Made in America Office (MIAO) of the Office of Management and Budget (OMB) published [Initial Implementation Guidance on Application of Buy America Preference in Federal Financial Assistance Programs for Infrastructure](#) (OMB Guidance M-22-11) on April 18, 2022. The guidance provides government-wide implementation direction for all Federal financial assistance programs for infrastructure. Despite the extensive guidance developed by MIAO, EPA's Office of Water infrastructure investment programs have received many questions that were not addressed in OMB Guidance M-22-11 or that require further clarification for EPA water infrastructure programs. The following questions and answers serve to supplement OMB Guidance M-22-11 with implementation procedures specific to EPA's relevant water infrastructure programs.

Section 70914(a) of the IIIA states when a Buy America preference under BABA applies: "Not later than... [May 14, 2022], the head of each Federal agency shall ensure that none of the funds made available for a Federal financial assistance program for infrastructure... may be obligated for a project unless all of the iron, steel, manufactured products, and construction materials used in the project are produced in the United States." Therefore, Federal financial infrastructure investments obligated on or after May 14, 2022, must comply with the BABA requirements. Absent a waiver, all iron, steel, manufactured products, and construction materials permanently incorporated into an infrastructure project subject to the BABA requirements must be produced in the United States. For many of EPA's Office of Water infrastructure investment programs, the vast majority of products permanently incorporated into construction, maintenance, or repair projects must comply with the BABA requirements, with the exception of select construction materials (cement and cementitious materials; aggregates such as stone, sand, or gravel; or aggregate binding agents or additives), which are specifically excepted by the BABA statute.

EPA's Office of Water implements many infrastructure investment programs subject to BABA requirements, including the following:

- Alaska Native Villages and Rural Communities Water Grant Program (ANV) (and any associated Interagency Agreements with the Indian Health Service)
- Clean Water and Drinking Water State Revolving Fund Programs (CW and DWSRF)
- Clean Water and Drinking Water Grants to U.S. Territories and the District of Columbia
- Clean Water Indian and Drinking Water Tribal Infrastructure Grant Set-aside (and any associated Interagency Agreements with the Indian Health Service)
- Coastal Wetlands Planning, Protection and Restoration Act, (CWPPRA) Programs
- Congressionally Directed Spending/Community Project Funding (also known as Community Grants)
- Geographic Programs<sup>1</sup>
- Gulf Hypoxia Program
- National Estuaries Program (CWA Section 320)

---

<sup>1</sup> Geographic Programs include: Great Lakes Restoration Initiative, Chesapeake Bay, San Francisco Bay, Puget Sound, Long Island Sound, Gulf of Mexico, South Florida, Lake Champlain, Lake Pontchartrain, Southern New England Estuaries, Columbia River Basin, Pacific Northwest

- 319 Nonpoint Source Management Program Implementation
- Reducing Lead in Drinking Water Grant Program (SDWA §1459B)
- Assistance for Small and Disadvantaged Communities Grants: Small, Underserved, and Disadvantaged Community Grant Program (SUDC), Emerging Contaminants in Small or Disadvantaged Communities (EC-SDC) and Drinking Water Infrastructure Resilience & Sustainability (SDWA §1459A)
- Sewer Overflow and Stormwater Reuse Municipal Grants (OSG)
- USMCA Implementing Legislation (Section 821 and Title IX, USMCA Supplemental Appropriations, 2020)
- U.S.-Mexico Border Water Infrastructure Program
- Voluntary School and Child Care Program Lead Testing and Remediation Grant Program (SDWA 1464(d))
- Water Infrastructure Finance and Innovation Act (WIFIA)

The questions and answers in this document apply to the implementation of BABA requirements for the Office of Water infrastructure programs listed above unless superseded by regulation, statute, or other applicable guidance. For many of the programs listed above which did not have domestic preference requirements prior to BABA, additional implementation details are pending or may be developed after the issuance of these procedures. In addition, EPA notes that more direction will be helpful to inform the determination and definition of domestic content in manufactured goods. Supplemental guidance on these and other issues, from either OMB or EPA, may be forthcoming. These implementation procedures may also apply to additional, unlisted EPA programs which may be required to apply BABA subsequent to publication of this memorandum (e.g., future funding programs which have been authorized, but not yet appropriated).

For more information on the BABA requirements, visit the EPA Office of Water’s dedicated website – <https://www.epa.gov/cwsrf/build-america-buy-america-baba> – or contact your funding authority (such as your grants officer, portfolio manager, or state contact). For information on approved waivers, visit <https://www.epa.gov/cwsrf/build-america-buy-america-baba-approved-waivers>. You may also email questions to [BABA-OW@epa.gov](mailto:BABA-OW@epa.gov).

This Implementation Procedures document is organized to provide responses to questions in the following topic areas:

• Section 1: General.....	4
• Section 2: Product Coverage.....	5
• Section 3: Co-funding.....	9
• Section 4: Waivers.....	10
• Section 5: Documenting Compliance.....	12
• Section 6: Programs with American Iron and Steel Requirements.....	16
• Section 7: Program-Specific Issues.....	17
• Appendix 1: Example Build America, Buy America (BABA) Act Construction Contract Language.....	22
• Appendix 2: Example Build America, Buy America (BABA) Act Assistance Agreement Language.....	23

## QUESTIONS AND ANSWERS

### SECTION 1: GENERAL

- Q1.1: Will EPA provide documentation for BABA for bid solicitations and suggested contract language? Will EPA provide suggested language for Assistance Agreements?
  - A1.1: See Appendix 1, which includes suggested language for construction contracts which addresses the BABA requirements. In addition to the language suggested in Appendix 1, EPA also recommends that assistance recipients prepare contract bid solicitation documents with a statement for the consulting engineers and construction firms as follows: “By signing payment application and recommending payment, Contractor certifies they have reviewed documentation for all products and materials submitted for payment, and the certifications are sufficient to demonstrate compliance with Build America, Buy America Act requirements.” In most cases, the assistance recipient’s representatives assume the responsibility for their clients to conduct due diligence on compliance with applicable domestic preference requirements.

All Federal Financial infrastructure assistance agreements subject to BABA must have a clause requiring compliance with the requirements. See Appendix 2 for example assistance agreement language.

- Q1.2: Would federally-financed infrastructure projects outside of the United States need to comply with the BABA requirements?
  - A1.2: No. According to the OMB Guidance (M-22-11), a “project” is defined as “...any activity related to the construction, alteration, maintenance, or repair of infrastructure in the United States.” Therefore, the BABA requirements are not implicated for infrastructure projects occurring outside of the United States, such as projects funded through the United States-Mexico-Canada Agreement with infrastructure activities occurring in Mexico or Canada (that is, outside the United States).
  -
- Q1.3: If most of the project is BABA compliant, and a small portion is not, can an assistance recipient self-fund (i.e., paying with non-federal dollars) the non-compliant products?
  - A1.3: Any project that is funded in whole or in part with federal assistance must comply with the BABA requirements, unless the requirements are otherwise waived. All iron, steel, manufactured products, and construction materials used in a project must meet the BABA requirements unless waived. Absent a waiver, there is no “small portion” or product that does not need to satisfy the BABA requirements unless the requirements are waived (or specifically excluded as is the case for cement and cementitious materials; aggregates such as stone, sand, or gravel; aggregate binding agents or additives; or non-permanent products). An assistance recipient may request a waiver or inquire as to whether a broad waiver, such as a *de minimis* waiver, might apply.

- Q1.4: How do international trade agreements affect the implementation of the BABA requirements?
  - A1.4: The BABA requirements apply in a manner consistent with United States obligations under international trade agreements. Typically, these obligations only apply to direct procurement by the entities that are signatories to these trade agreements. In general, assistance recipients are not signatories to such agreements, so these trade agreements have no impact on BABA implementation. In the few instances where such an agreement applies to a municipality, that municipality is responsible for determining its applicability and requirements and communicating with the funding authority (such as EPA and/or a state) on the actions taken to comply with BABA.

SECTION 2: PRODUCT COVERAGE

- Q2.1: For products made of iron and steel, what is the difference between predominantly and primarily iron and steel?
  - A2.1: EPA considers the terms “predominantly” and “primarily” to be interchangeable, such that a product is considered predominantly (or primarily) iron and steel if it contains greater than 50 percent iron and steel by material cost.
- Q2.2: What is the definition of construction materials (with examples)?
  - A2.2: From OMB Guidance M-22-11: “construction materials” include an article, material, or supply (other than an item of primarily iron or steel; a manufactured product; cement and cementitious materials; aggregates such as stone, sand, or gravel; aggregate binding agents or additives; or non-permanent products) that is or consists primarily of:
    - non-ferrous metals,
    - plastic and polymer-based products (including polyvinylchloride, composite building materials, and polymers used in fiber optic cables), (including optic glass),
    - lumber, and
    - drywall.

For example, a plate of glass would be a construction material under BABA, but a framed window that incorporates the glass into a frame would be a manufactured product. Another common construction material for water infrastructure projects would be polyvinyl chloride (PVC) pipe and fittings. However, if PVC components are incorporated into a more complex product such as instrumentation and control equipment or a water treatment unit, those items would be manufactured products.

- Q2.3: What are manufactured products (with examples)?
  - A2.3: From OMB Guidance M-22-11: “...all manufactured products used in the project are produced in the United States—this means the manufactured product was manufactured in the United States; and the cost of the components of the manufactured product that are mined, produced, or manufactured in the United States is greater than 55 percent of the total

cost of all components of the manufactured product, unless another standard for determining the minimum amount of domestic content of the manufactured product has been established under applicable law or regulation...”

The manufactured products category would cover the majority of potential water infrastructure products, including complex products made up of a variety of material types and components. For water infrastructure projects, common manufactured products would include, but not be limited to, pumps, motors, blowers, aerators, generators, instrumentation and control systems, gauges, meters, measurement equipment, treatment equipment, dewatering equipment, actuators, and many other mechanical and electrical items.

- Q2.4: Which category will valves fall under for BABA? Will it differ from the American Iron and Steel (AIS) requirements?
  - A2.4: For programs that are subject to BABA and AIS (SRF, WIFIA, and Community Project Funding), projects using valves should classify them as iron and steel products under BABA as long as their material cost is made up of more than 50 percent iron and/or steel. Valves with 50 percent or less iron and/or steel by material cost would be considered manufactured products under the BABA requirements.

In accordance with OMB Guidance M-22-11, an article, material, or supply should be classified into only one of the three categories: iron and steel, manufactured products, or construction materials. Under the AIS requirements, all valves made primarily of iron and steel (that is, those with iron and/or steel material cost greater than 50 percent) must comply with the AIS requirements. For BABA, EPA interprets Section IV of OMB Guidance M-22-11 to mean that iron and steel products are those items that are primarily iron and steel, the same as for the AIS requirements.

- Q2.5: Does EPA have a list of products to be classified as “Iron and Steel” under BABA?
  - A2.5: Although this list is not comprehensive, the following products were classified as AIS products if made primarily (more than 50 percent) of iron and/or steel by materials cost (for programs subject to both AIS and BABA, this list would be equivalent for “iron and steel” items or products under either requirement):

Products likely made “primarily” of iron and steel to be classified as <u>Iron and Steel</u> under BABA		
Lined and Unlined Pipe	Lined and Unlined Fittings	Tanks
Flanges	Pipe Clamps and Restraints	Structural Steel
Valves	Hydrants	Pre-Cast, Iron/Steel Reinforced Concrete (of all types, regardless of iron/steel content percentage)
Manhole Covers and other Municipal Castings	Access Hatches	Ballast Screens
Iron or Steel Benches	Bollards	Cast Bases
Cast Iron Hinged Hatches	Cast Iron Riser Rings	Catch Basin Inlets
Cleanout/Monument Boxes	Construction Covers and Frames	Curb and Corner Guards

Products likely made "primarily" of iron and steel to be classified as <u>Iron and Steel</u> under BABA		
Curb Boxes	Curb Openings	Curb Stops
Detectable Warning Plates	Downspout Shoes	Drainage Grates
Drainage Grate Frames and Curb Inlets	Inlets	Junction Boxes
Lampposts	Manhole Rings and Frames	Manhole Risers
Meter Boxes	Service Boxes	Steel Hinged Hatches
Steel Riser Rings	Trash Receptacles	Tree Grates
Tree Guards	Trench Grates	Valve Boxes
Valve Box Covers and Risers	Access Ramps	Aeration Pipes and Fittings (separate from aeration/blowers)
Angles	Backflow Preventers/Double Check Valves	Baffle Curtains
Iron or Steel Bar	Bathroom Stalls	Beam Clamps
Cable Hanging Systems	Clarifier Tanks	Coiled Steel
Column Piping	Concrete Reinforcing Bar, Wire, and Fibers	Condensate Sediment Traps
Corrugated Pipe	Couplings	Decking
Digester Covers	Dome Structures	Door Hardware
Doors	Ductwork	Expansion Joints
Expansion Tanks (diaphragm, surge, and hydropneumatics)	Fasteners	Fencing and Fence Tubing
Fire Escapes	Flanged Pipe	Flap Gates
Framing	Gate Valves	Generic Hanging Brackets
Grating	Ground Testing Boxes	Ground Test Wells
Guardrails	HVAC Registers, Diffusers, and Grilles	Joists
Knife Gates	Ladders	Lifting Hooks, J-bar, Connectors within, and Anchors for Concrete
Lockers	Man Baskets and Material Platforms	Manhole Steps
Mud Valves	Municipal Casting Junctions	Non-mechanical (aka stationary) Louvers and Dampers
Overhead Rolling Doors/ Uplifting Doors (manual open, no motor)	Pipe Connectors	Pipe Hangers
Pipe Piling (any type of steel piling)	Pipe Spool (pipe, flanges, connectors, etc.)	Pipe Supports
Pitless Adaptors	Pre-fab Steel Buildings/Sheds (simple structure, unfinished)	Pre-stressed Concrete Cylinder Pipe (PCCP)
Railings	Reduced Pressure Zone (RPZ) Valves	Roofing
Service Saddles	Sheet Piling	Sinks (not part of eyewash systems)
Solenoid Valves	Stairs	Static Mixers
Stationary Screens	Surface Drains	Tapping Sleeves
Telescoping Valves	Tipping Buckets	Trusses
Tubing	Valve Stem Extensions	Valve Stems (excluding handwheels and actuators)
Wall Panels	Wall Sleeves/Floor Sleeves	Welding Rods
Well Casing	Well Screens	Wire
Wire Cloth	Wire Rod	Wire Rope and Cables

Q2.6: Does EPA have a list of products that could be made “primarily” of iron and steel but would be classified as “manufactured products” under BABA?

A2.6: Although this list is not comprehensive, the following products would be considered “manufactured products” under the BABA requirements, even if the item might be composed primarily of iron and steel by materials cost (Note: These items are not subject to the AIS requirements.):

Products likely made “primarily” of iron and steel to be classified as <u>Manufactured Products</u> under BABA		
Actuator Superstructures/ Support Structures	Aeration Nozzles and Injectors	Aerators
Analytical Instrumentation	Analyzers (e.g., ozone, oxygen)	Automated Water Fill Stations
Blowers/Aeration Equipment	Boilers, Boiler Systems	Chemical Feed Systems (e.g., polymer, coagulant, treatment chemicals)
Chemical Injection Quills	Chemical Injectors	Clarifier Mechanisms/Arms
Compressors	Controls and Switches	Conveyors
Cranes	Desiccant Air Dryer Tanks	Dewatering Equipment
Dewatering Roll-offs	Disinfection Systems	Drives (e.g., variable frequency drives)
Electric/Pneumatic/Manual Accessories Used to Operate Valves (such as electric valve actuators)	Electrical Cabinetry and Housings (such as electrical boxes/enclosures)	Electrical Conduit
Electrical Junction Boxes	Electronic Door Locks	Elevator Systems (hydraulic, etc.)
Emergency Life Systems (including eyewash stations, emergency safety showers, fire extinguishers, fire suppression systems including sprinklers /piping/valves, first aid, etc.)	Exhaust Fans	Fall Protection Anchor Points
Fiberglass Tank w/Appurtenances	Filters (and appurtenances, including underdrains, backwash systems)	Flocculators
Fluidized Bed Incinerators	Galvanized Anodes/Cathodic Protection	Gear Reducers
Generators	Geothermal Systems	Grinders
Heat Exchangers	HVAC (excluding ductwork)	HVAC Dampers (if appurtenances to aerators/blowers)
HVAC Louvers (mechanical)	Intake and Exhaust Grates (if appurtenances to aerators/blowers)	Instrumentation
Laboratory Equipment	Ladder Fall Prevention Systems	Ladder Safety Posts
Lighting Fixtures	Lightning and Grounding Rods	Mechanical or Actuated Louvers/Dampers
Membrane Bioreactor Systems	Membrane Filtration Systems	Metal Office Furniture (fixed)
Meters (including flow, wholesale, water, and service connection)	Motorized Doors (unit)	Motorized Mixers
Motorized Screens (such as traveling screens)	Motors	Pelton Wheels
Pipeline Flash Reactors (similar to injectors)	Plate Settlers	Precast Concrete without Iron/Steel Reinforcement

Products likely made "primarily" of iron and steel to be classified as <u>Manufactured Products</u> under BABA		
Furnished Pre-fab Buildings (such as furnished with pumps, mechanics inside)	Presses (including belt presses)	Pressure Gauges
Pump Cans/Barrels and Strainers	Pumps	Mechanical Rakes
Safety Climb Cable	Sampling Stations (unless also act as hydrant)	Scrubbers
Sensors	Sequencing Batch Reactors (SBR)	Steel Shelving (fixed)
Slide and Sluice Gates	Spray Header Units	Steel Cabinets (fixed interior/furniture)
Supervisory Control and Data Acquisition (SCADA) Systems	Tracer Wire	Valve Manual Gears, Actuators, Handles
Voltage Transformer	Water Electrostatic Precipitators (WESP)	Water Heaters
Weir Gates		

- Q2.7: Is asphalt paving a covered product under BABA?
  - A2.7: No. EPA interprets Section 70917(c) of the IIIA to exclude asphalt from BABA requirements. Asphalt paving is a type of concrete composed of an aggregate material mixed with a binder (bitumen). EPA considers asphalt concrete to be excluded by section 70917(c) due to its similarities with cement and cementitious materials.

### SECTION 3: CO-FUNDING

- Q3.1: If projects are co-funded with funding mechanisms that don't require BABA, must the entire project comply with BABA?
  - A3.1: Yes. Any project that is funded in whole or in part with federal assistance must comply with the BABA requirements, unless the requirements are otherwise waived. A "project" consists of all construction necessary to complete the building or work regardless of the number of contracts or assistance agreements involved so long as all the contracts and assistance agreements awarded are closely related in purpose, time, and place. This precludes the intentional splitting of projects into separate and smaller contracts or assistance agreements to avoid BABA's applicability on some portions of a larger project, particularly where the activities are integrally and proximately related to the whole. However, there are many situations in which major construction activities are clearly undertaken in separate phases that are distinct in purpose, time, or place, in which case, separate contracts or assistance agreements would carry separate requirements.

- Q3.2: How will project requirements be determined for co-funded projects subject to potentially different general applicability/programmatic waiver conditions (such as different adjustment period waivers)?
  - A3.2: OMB Guidance M-22-11 addresses cases with project co-funding from separate programs. EPA would apply the guidance’s “cognizant” program determination to projects that are co-funded with different general applicability/programmatic waivers. For instance, if a project were co-funded between WIFIA and SRF and the majority of the Federal funding for the project is from WIFIA, then WIFIA would be the “cognizant” program for application and determination of waivers. In that case, any conditions from an applicable WIFIA waiver would apply.

#### SECTION 4: WAIVERS

- Q4.1: Who may apply for a waiver and how do you apply?
  - A4.1: Assistance recipients and their authorized representatives may apply for a project-specific waiver. EPA does not accept waiver requests from suppliers, distributors, or manufacturers unless the assistance recipient endorses and submits the request on its own behalf to the funding authority. In the case where multiple programs are providing federal funds to the project, the assistance recipient should submit the waiver request to the cognizant program, the one providing the greatest amount of federal funds for the project. For information on applying for cost waivers, see questions 4.4 and 4.5. For information on the SRF program roles and responsibilities, see question 7.6.

Project-specific waiver requests should generally include: (1) a brief summary of the project, (2) a description and explanation of the need for the waiver for the product(s) in question, (3) a brief summary of the due diligence conducted in search of domestic alternatives (which could include correspondence between assistance recipient and supplier/distributors), (4) the quantity and materials of the product(s) in question, (5) all engineering specifications and project design considerations relevant to the product(s) in question, (6) the approximate unit cost of items (both foreign and domestic) in addition to an estimated cost of the materials and overall project, (7) the date any products will be needed on site in order to avoid significant project schedule disruptions, and (8) any other pertinent information relevant to EPA’s consideration of the waiver (e.g., if relevant for SRF projects: whether the project is designated as an equivalency project, the date the plans and specifications were submitted to the state, the date of construction initiation, expected date of project completion, any special considerations such as local zoning and building ordinances, seismic requirements, or noise or odor control requirements).

In the case of indirect federal assistance, such as the SRF programs, the state authority reviews and conveys the waiver request to EPA. States should submit waiver requests to the appropriate program waiver request inbox. For SRF projects, please use [CWSRFWaiver@epa.gov](mailto:CWSRFWaiver@epa.gov) or [DWSRFWaiver@epa.gov](mailto:DWSRFWaiver@epa.gov).

- Q4.2: Can an assistance recipient request a waiver based on a specification written for a specific brand or model of product (that is, a specification that names a branded item or model)?
  - A4.2: In most cases, performance-based specifications are expected and required for the majority of infrastructure projects funded by EPA’s financial assistance programs. In rare cases where “branded” or product-specific sourcing may be included in project specifications, it is suggested that the specifications include the item in question (that is, not simply a catalog page, but also materials of construction, sizing, quantities, and applicable engineering performance design characteristics for the project, etc.) in addition to the standard phrase “or equal.” For the purposes of product alternative market research, EPA will evaluate the BABA requirements based on performance-based engineering specifications for the product(s) in question. If the project’s specifications do not include performance-based specifications, or at least an “or equal” designation, EPA will base its research on an “or equal” designation using best professional judgment to the extent practicable.
  
- Q4.3: If a manufactured product is not readily available domestically, will EPA provide short-term “limited availability” product waivers?
  - A4.3: EPA will address the unavailability of domestic products through the waiver process, including potential national short-term waivers for specific products, if appropriate. To the extent practicable and with the intent to maximize domestic market and supply chain development, EPA intends to address issues of broad product unavailability with targeted, time-limited, and conditional waivers, as prescribed in OMB Guidance M-22-11. EPA will follow its robust and thorough product research processes (those put into place for the AIS requirements for the SRF and WIFIA programs and expanded for the new BABA requirements) to identify and determine those products for which proposed national/general applicability waivers may be appropriate.
  
- Q4.4: What information is needed when applying for a cost waiver under BABA?
  - A4.4: As part of the cost waiver request, the assistance recipient must demonstrate that implementation of the BABA requirements will increase the overall project cost more than 25 percent. Depending on the circumstances of the overall project cost increases, documentation to justify the cost waiver can vary but may include itemized cost estimates or bid tabulations comparing project costs with and without BABA implementation. Assistance recipients should begin assessing the potential cost impacts of the BABA requirements during the design phase of a project.
  
- Q4.5: Can administrative costs associated with tracking and verification of certifications be considered when determining if the cost of a project increases by 25 percent or more?
  - A4.5: Yes. Section 70914(b)(3) of the IIJA states that a waiver may be provided if the overall cost of the project increases by more than 25 percent due to the “inclusion of iron, steel, manufactured products, or construction materials produced in the United States.” EPA interprets this to mean that the “inclusion” of the BABA-covered products could encompass

reasonable administrative costs associated with complying with the BABA requirements, such as staff, contractor, and technological resources to collect and track BABA compliance documentation.

- Q4.6: How can assistance recipients and construction contractors address product delivery delays?
  - A4.6: Assistance recipients should reasonably plan for material procurement to account for known potential supply chain issues or extended lead times and shall notify the funding authority well in advance of the issues so that prompt attention can be given to explore options. Where extended lead times for compliant products are impacting project schedules and may significantly impact construction progress, timely communication with the funding agency is important. For products that are unavailable within a reasonable timeframe to meet the objectives and schedule of a project, EPA may consider a non-availability waiver with adequate justification. An assistance recipient would need to apply for the waiver and contact its funding authority (such as EPA and/or a state) to initiate the waiver process.

#### SECTION 5: DOCUMENTING COMPLIANCE

- Q5.1: Who will be responsible for BABA enforcement?
  - A5.1: Responsibility for BABA implementation applies at all levels, from manufacturers to suppliers and distributors, construction contractors, assistance recipients, and funding authorities.

The manufacturers have responsibility to provide adequate and accurate documentation of the products manufactured. If suppliers and distributors are involved, they are responsible for passing along compliance documentation for products supplied to projects that are subject to the BABA requirements.

The assistance recipient and their representatives are primarily responsible for ensuring the documentation collected for products used on the project is sufficient to document compliance with the BABA requirements.

The funding authority is responsible for providing oversight and guidance as needed to ensure the proper implementation of the requirements. The Uniform Grants Guidance (UGG) (Title 2 of the Code of Federal Regulations (CFR) Part 200) applies to many Federal financial assistance agreements that will include BABA requirements. The general provisions of 2 CFR Part 200 determine the responsible party for the grant funding authority.

For information on SRF program roles and responsibilities, see question 7.6.

At all levels, where fraud, waste, abuse, or any violation of the law is suspected, the Office of Inspector General (OIG) should be contacted immediately. The OIG can be reached at 1-888-546-8740 or [OIG\\_Hotline@epa.gov](mailto:OIG_Hotline@epa.gov). More information can be found at this website: <http://www.epa.gov/oig/hotline.htm>.

- Q5.2: When will the BABA requirements be assessed for compliance? Do assistance recipients need to have waivers for potential non-domestic products before assistance agreements are in place, at the time products are procured or products are incorporated into the project (i.e., used)?
  - A5.2: Compliance is assessed where the domestic product is used (or installed) at the project site. Proper compliance documentation, whether it is a BABA certification letter or a waiver, should accompany a product prior to its “use”, in accordance with Section 70914(a) of IIJA. This may occur prior to assistance agreements being in place but is not necessary. Additionally, communication of BABA requirements through appropriate Terms and Conditions in financial assistance agreements and in project solicitation and contract documents is key in ensuring all parties involved are informed of the requirements for the project before construction is underway.
  
- Q5.3: How can product compliance with the BABA requirements be demonstrated?
  - A5.3: Assistance recipients and their representatives should ensure that the products delivered to the construction site are accompanied by proper documentation that demonstrate compliance with the law and be made available to the funding authority upon request. The documentation may be received and maintained in hard copy, electronically, or could be embedded in construction management software. The use of a signed certification letter for the project is the most direct and effective form of compliance documentation for ensuring products used on site are BABA-compliant prior to their installation; however, other forms of documentation are also acceptable as long as collectively, the following can be demonstrated:
    - (1) Documentation linked to the project. For example, this can be in the form of the project name, project location, contract number, or project number.
    - (2) Documentation linked to the product used on the project. For example, description of product(s) (simple explanation sufficient to identify the product(s)), or an attached (or electronic link to) purchase order, invoice, or bill of lading.
    - (3) Documentation includes statement attesting that the products supplied to the assistance recipient are compliant with BABA requirement. Reference to the Infrastructure Investment and Jobs Act (“IIJA”) or the Bipartisan Infrastructure Law (BIL) are also acceptable. For iron and steel items under BABA, references to the American Iron and Steel (AIS) requirements are also acceptable and reciprocal with BABA for such items.
    - (4) Documentation that manufacturing occurred in the United States, which could include, for example, the location(s) of manufacturing for each manufacturing step that is being certified. It is acceptable for manufactured products to note a single point of manufacturing, documenting that the final point of manufacturing is in the United States. Note that each BABA category may require different determinations for compliance.
    - (5) Signature of company representative (on company letterhead and signature can be electronic). The signatory of the certifying statement affirms their knowledge of the manufacturing processes for the referenced product(s) and attests that the product meets the BABA requirements.

In addition to compliance documentation, assistance recipients or their representatives should also conduct a visual inspection of the product when it arrives to the project site, especially for iron and steel products which are often stamped with the country of origin. (Note: A country of origin stamp alone is not sufficient verification of compliance with BABA and assistance receipts should not rely on it to ensure compliance.)

EPA may develop alternative procedures for demonstrating compliance. Additional project- or program-specific instructions may be developed on a case-by-case basis in order to meet individual circumstances.

- Q5.4: Will EPA provide a form or template for tracking and documenting compliance?
  - A5.4: EPA does not require a specified format for tracking or documenting compliance. Assistance recipients are free to develop any system (from simple to complex software) for tracking items used on the project and the accompanying compliance documentation, e.g., certification letters, applicable waivers, if it helps with implementation and compliance. Elements that may help with keeping track of compliance may include: product description, quantity required/used, product category (i.e., iron and steel, manufactured product, or construction material), status of obtaining certification letter, product cost, and whether the item might qualify as *de minimis*, or qualify under another applicable waiver.
- Q5.5: If a manufacturer claims to comply with the Buy American Act, does it also comply with BABA?
  - A5.5: No. With the exception of the AIS requirements – which EPA interprets to be equivalent to the “iron and steel” requirements under BABA – EPA does not have an interpretation about the comparability of other domestic preference requirements relative to BABA. Any products that are to be certified as compliant with BABA should include a specific reference to the BABA requirements and appropriate attestation from a responsible manufacturing company official. See Question 5.3 for EPA’s recommendations for BABA certification letters.
- Q5.6: How will assistance recipients manage certification letters for hundreds, possibly thousands of products?
  - A5.6: EPA recognizes that the new BABA requirements will cover most products used in typical water and wastewater infrastructure projects, and that the number of items which may require certification at large and/or complex projects may reach several hundred. EPA is concerned about the potential administrative burden that this would place on assistance recipients. EPA recommends that projects with a high number of potentially covered products meet with their funding authority about potential compliance strategies to minimize burden and streamline compliance activity. Assistance recipients should prepare contract bid solicitation documents with a statement for the consulting engineers and construction firms as follows: “By signing payment application and recommending payment, Contractor certifies they have reviewed documentation for all products and materials submitted for payment, and the documentation is sufficient to demonstrate compliance with Build America,

Buy America Act requirements.” In most cases, the assistance recipient’s representatives may assume the responsibility for their clients to conduct due diligence on compliance with applicable domestic preference requirements.

- Q5.7: Who is responsible for documenting the 55 percent content requirement for manufactured products under BABA? What if the final manufacturer cannot trace or verify domestic origin for all components?
  - A5.7: The manufacturer who signs a certification letter is responsible for documenting compliance with any of the three categories of products (iron and steel, manufactured products, or construction materials). For manufactured products, BABA requires that greater than 55 percent of the total cost of all components of the manufactured product be from domestic sources. EPA recommends that the certification letter for manufactured products document whether the item passes the content test in the final product along with a statement attesting to compliance with the BABA requirements for manufactured products.
- Q5.8: How do final product fabricators document compliance when the final step of manufacturing may be simply assembling components?
  - A5.8: It is acceptable, in many cases, especially for highly complex manufactured products that utilize many sub-components, for the final point of assembly to certify without using a “step certification” process. Multiple certifications (i.e., step certifications) or a singular certification can be used for a product, as long as the certifying official is willing to attest to the product’s compliance with BABA requirements at all stages of manufacturing.
- Q5.9: Will Material Test Reports be acceptable in lieu of a BABA certification for iron and steel?
  - A5.9: Material Test Reports (MTRs, commonly referred to as “Mill Certifications” or “Mill Certs”) provide the chemical composition of steel and iron from a mill or foundry. If an MTR accompanies the delivery of steel or iron to a project site with an invoice or bill of lading, EPA will consider it sufficient to demonstrate compliance (equivalent to a certification letter) as long as the MTR includes a manufacturer representative’s signature in addition to the location (city and state) of the mill/foundry. It is common for MTRs to be the first letter in a “step certification” if the product is further fabricated or painted, etc., by another manufacturer.
- Q5.10: Can a manufacturer use a fillable certification letter for products?
  - A5.10: EPA recommends that certifications be signed by representatives of the manufacturing entity. EPA does not oppose manufacturers using forms to internally develop letters within their company, thereby providing signed, non-manipulable certification letters to suppliers, distributors, and/or assistance recipients. A fillable form that can be changed by someone outside of the manufacturer after signature does not demonstrate compliance and may create compliance concerns for the manufacturer or assistance recipient.

- Q5.11: Are product certifications from suppliers and distributors allowed?
  - A5.11: EPA recommends that representatives of product manufacturers certify compliance and discourages suppliers and distributors from creating certification letters. EPA does not rule out the possibility that a third-party certification process, such as a certification by a distributor, may be viable. However, EPA is currently not aware of a system or proposed system that meets the EPA's recommendations for documentation of product certification.
- Q5.12: How long should assistance recipients keep compliance documentation?
  - A5.12: Assistance recipients should apply recordkeeping requirements for the project according to the procedures dictated by the funding authority. For most EPA grant programs, this is prescribed in the UGG at 2 CFR 200.334-200.338; e.g., the SRF programs require a minimum of three years. Other funding programs may require longer documentation retention periods.

#### SECTION 6: PROGRAMS WITH AMERICAN IRON AND STEEL REQUIREMENTS

- Q6.1: Does BABA supersede the American Iron and Steel (AIS) Requirements?
  - A6.1: The BABA requirements for items considered "iron and steel" are equivalent to those for covered iron and steel products under the AIS requirements in the Clean Water Act and the Safe Drinking Water Act. These requirements apply to the CWSRF, DWSRF, WIFIA, and Water Infrastructure Community Grants. BABA includes a "Savings Provision" (Section 70917(b)) that states that BABA does not affect existing domestic content procurement preferences for infrastructure projects funded by Federal financial assistance programs that meet the requirements of section 70914. EPA views the AIS requirements as meeting the "iron and steel" product requirements of BABA Section 70914, as they both include the key requirement that items made of iron and steel be wholly manufactured in the United States from the point of melting and/or pouring the iron or steel components through final manufacturing step. Because of the "Savings Provision" of Section 70917, the AIS requirements satisfy the "iron and steel" requirements of BABA. For the programs that have AIS requirements, EPA intends to implement BABA requirements the same way for iron and steel items as it has done for AIS products.
- Q6.2: For iron and steel products, does a manufacturer need to demonstrate compliance from initial melting through the finished product?
  - A6.2: For iron and steel products, the BABA requirements are the same as the existing AIS requirements, in that all of the iron and steel in a covered product (that is, the product is comprised of more than 50 percent iron and steel by material cost) must be melted and poured in the United States and all subsequent manufacturing processes (such as grinding, rolling, bending, reheating, and casting) must occur in the United States.

Q6.3: Will EPA apply the same manufacturing standards for BABA iron and steel products as for the American Iron and Steel (AIS) requirements?

- A6.3: Yes. For AIS, EPA did not require raw materials used in the production of steel or iron to be domestically sourced. For BABA, EPA interprets the requirements to be the same. Hence, like AIS, raw materials in the production of iron and steel subject to BABA requirements would not need to be domestically sourced. The key step for both AIS and BABA domestic iron and/or steel production is the melting/pouring (that is, the location of the furnace), which must be in the United States.
- Q6.4: Will the certification process be similar to the process established for the American Iron and Steel requirements?
  - A6.4: EPA expects the certification process for the BABA requirements to be very similar to that established for the AIS requirements. For iron and steel products, the process should remain the same for AIS and BABA. EPA recommends for manufactured products and for construction materials that certification letters include direct reference to the product/material content requirements under BABA, in addition to an affirmative statement verifying that the product meets the BABA requirements.
- Q6.5: Will duplicate certification letters be required for AIS and BABA for iron/steel products?
  - A6.5: No. Compliance with BABA requirements will be sufficient to demonstrate compliance with AIS requirements for iron and steel products. If a project is subject to BABA, the only demonstration of compliance necessary is with the BABA requirements, of which the iron and steel requirements are equivalent to those of the AIS statutory requirements: the iron or steel in a product made primarily or predominantly of iron and steel (comprising more than 50 percent iron and steel by material cost) must be melted and/or poured in the United States and all subsequent manufacturing processes must occur in the United States.

#### SECTION 7: PROGRAM-SPECIFIC ISSUES

- Q7.1.: How do the BABA requirements apply to Community Grants?
  - A7.1: The Community Project Funding/Congressionally Directed Spending grants for the construction of drinking water, wastewater, and stormwater infrastructure and for water quality protection are subject to the requirements specified in the explanatory statement accompanying the Consolidated Appropriations Act (Explanatory Statement for Division G of P.L. 117-13, the Consolidated Appropriations Act of 2022). The explanatory statement asserts: “Applicable Federal requirements that would apply to a Clean Water State Revolving Fund or Drinking Water State Revolving Fund project grant recipient shall apply to a grantee receiving a CPF grant under this section.” Therefore, the federally funded Community Project Funding/Congressionally Directed Spending grants are subject to the same requirements that apply to CWSRF or DWSRF projects, including BABA and AIS requirements. See also A1.2.

- Q7.2: Should SRF projects covered by the BABA SRF Projects Design Planning Adjustment Period Waiver follow the same procedures for demonstrating compliance as outlined for American Iron and Steel requirements?
  - A7.2: Yes. The SRF Design Planning Adjustment Period waiver does not waive the iron and steel requirements under BABA. The SRF programs have existing domestic preference requirements for SRF projects under CWA Section 608 and SDWA Section 1452(a)(4) (AIS requirements) to use iron and steel products that are produced in the United States. Sections 70917(a) and (b) of BIL explain the application of BABA to existing domestic preference requirements. Specifically, the savings provision in Section 70917(b) states that existing domestic preference requirements that meet BABA requirements are not affected by BABA. The statutory AIS requirements were existing at the time BABA became law and satisfy the BABA iron and steel requirements. Therefore, the statutory AIS requirements that have previously applied to SRF-funded projects will continue to do so, and compliance with AIS requirements will satisfy the BABA iron and steel requirements. Demonstration of compliance for iron and steel products will follow the AIS implementation policies for projects subject to the waiver.
- Q7.3: For SRF programs, is BABA considered a federal cross-cutting authority? (i.e., do “equivalency” rules apply?)
  - A7.3: Yes, BABA is considered a federal cross-cutting requirement that applies to SRF assistance equivalent to the federal capitalization grant (i.e., “equivalency” projects). EPA’s SRF regulations at 40 CFR 35.3145 and 35.3575 require states and recipients of SRF funds equivalent to the amount of the federal capitalization grant to comply with federal cross-cutting requirements. Section 70914 of the IIJA, which states when a Buy America preference applies, explains that “none of the funds made available for a Federal financial assistance program for infrastructure... may be obligated for a project unless all of the iron, steel, manufactured products, and construction materials used in the project are produced in the United States.” Therefore, BABA only applies to projects funded in an amount equivalent to the federal capitalization grant and not to those projects receiving funds in excess of the capitalization grant (i.e., “non-equivalency” projects). (Note: The AIS requirements continue to apply for all SRF projects, including non-equivalency projects, and all WIFIA and Community Grant projects, because equivalency does not apply.)
- Q7.4: Do the BABA requirements apply to Drinking Water State Revolving Fund set-asides?
  - A7.4: Due to requirements related to the deposit of funds in the DWSRF program, almost all of the funds used to conduct set-aside activities are Federal dollars. Therefore, Federal cross-cutting requirements must be applied to all set-aside activities. However, in the case of most set-aside activities, the cross-cutting requirements will not be implicated because of the nature of the activities conducted under the set-asides. Because the BABA requirements only apply to infrastructure, and infrastructure typically is not an eligible set-aside expenditure (with one potential exception being loans for incentive-based source water protection

measures under the Local Assistance and Other State Programs Set-Aside), the BABA requirements will not apply to most set-aside activities.

- Q7.5: What if an SRF project is refinanced using Federal financial assistance on or after May 14, 2022?
  - A7.5: If an SRF project began construction, financed from another funding source, prior to May 14, 2022, but is refinanced through an assistance agreement executed on or after that date, BABA requirements will apply to all construction that occurs on or after May 14, 2022, through completion of construction, unless a waiver applies. There is no retroactive application of the BABA requirements where a refinancing occurs for an SRF project that has completed construction prior to May 14, 2022. (Note: If SRF funding is used for the refinancing, the AIS requirements may still apply depending on the timing of construction.)
- Q7.6: What are the roles and responsibilities for SRF programs for BABA implementation?
  - A7.6: Implementation of the BABA requirements for the State Revolving Fund programs will continue the roles and responsibilities from the successful AIS implementation process.

As with AIS, it is both the assistance recipient's and the state's responsibility to ensure compliance with the BABA requirements. The state is the recipient of a federal capitalization grant and must comply with all grant conditions, including a condition requiring adherence to BABA requirements.

Consequently, states are strongly advised to conduct site visits of projects during construction and review documentation demonstrating the assistance recipient's proof of compliance. In EPA's experience, most states conduct periodic site visits and arrange timely meetings with funded projects. Observed best practices typically include a meeting early in the process (sometimes before bid and usually prior to commencing construction) and at least one project site visit during the construction process. Assistance recipients must maintain documentation of compliance with the BABA requirements, as explained in question 5.3. The documents must be kept by the assistance recipient and should be reviewed by the state during project reviews.

The state's role in the waiver process is to review any waiver requests submitted to the state to ensure that all necessary information has been provided by the assistance recipient prior to forwarding the request to EPA. If a state finds the request lacking, the state should work with the assistance recipient to help obtain complete information. Question 4.1 explains the information needed by EPA to expediently review a waiver request.

In order to implement the BABA requirements, EPA has developed an approach for effective and efficient implementation of the waiver process to allow projects to proceed in a timely manner. The framework described below will allow states, on behalf of the assistance recipients, to apply for waivers of the BABA requirements directly to EPA Headquarters. Only waiver requests received and/or endorsed from states will be considered. Pursuant to BABA, EPA has the responsibility to make findings as to the issuance of waivers to the BABA requirements.

### Step-by-step SRF Waiver Process

The waiver process begins with the assistance recipient. To fulfill the BABA requirements, the assistance recipient must in good faith design the project (where applicable) and solicit bids for construction with American-made iron and steel, manufactured goods, and construction materials. It is essential that the assistance recipient include the BABA terms in any request for proposals or solicitations for bids, and in all contracts (see Appendix 2 for sample construction contract language). The assistance recipient may receive a waiver at any point before, during, or after the bid process, if one or more of three statutory conditions is demonstrated to EPA and approved.

To apply for a project-specific waiver, the assistance recipient should email the request in the form of a Word document (.doc) or editable PDF (.pdf) to the funding program. It is strongly recommended that each state identify a person or persons for BABA communications. The state designee(s) will review the application for the waiver and determine whether the necessary information has been included (Note: More information may be provided in the future regarding what information is required to be included in waiver requests). Once the waiver application is complete, the designee will forward the application to [CWSRFWaiver@epa.gov](mailto:CWSRFWaiver@epa.gov) or [DWSRFWaiver@epa.gov](mailto:DWSRFWaiver@epa.gov).

### Evaluation by EPA

After receiving an application for waiver of the BABA requirements and ensuring sufficient information was provided, EPA will publish the request on its website for 15 days and receive public comment. EPA will then determine whether the application properly and adequately documents and justifies the statutory basis cited for the waiver.

In the event that EPA finds that adequate documentation and justification has been submitted, the Administrator may grant a waiver to the assistance recipient. EPA will notify the state designee whether a waiver request has been approved or not approved as soon as such a decision has been made. Granting such a waiver is a four-step process:

1. Research – After receiving an application for a waiver, EPA will perform market research to determine whether the iron, steel, manufactured goods, or construction materials are available domestically.
2. Posting – After research, if no domestic product has been identified, EPA is required to publish the application and all material submitted with the application on EPA's website for 15 days. During that period, the public will have the opportunity to review the request and provide informal comment to EPA. The website can be found at: <https://www.epa.gov/cwsrf/build-america-buy-america-baba-waivers-open-public-comment>
3. Evaluation – After receiving an application for waiver of the BABA requirements, EPA will determine whether the application properly and adequately documents and justifies the statutory basis cited for the waiver to determine whether or not to grant the waiver.

3. Signature of waiver approval by the Administrator or another agency official with delegated authority – As soon as the waiver is signed and dated, EPA will notify the State SRF program and post the signed waiver on the Agency’s website. The assistance recipient should keep a copy of the signed waiver in its project files.

(Note: Additional steps may be required in the future regarding the waiver process depending on additional guidance from OMB)

## APPENDIX 1

### Example Build America, Buy America (BABA) Act Construction Contract Language

ALL CONSTRUCTION CONTRACTS MUST HAVE A CLAUSE REQUIRING COMPLIANCE WITH THE BABA REQUIREMENTS. THIS IS AN EXAMPLE OF WHAT COULD BE INCLUDED IN A PROJECT'S CONSTRUCTION CONTRACT. EPA MAKES NO CLAIMS REGARDING THE LEGALITY OF THIS CLAUSE WITH RESPECT TO STATE OR LOCAL LAW:

The Contractor acknowledges to and for the benefit of the \_\_\_\_\_ (“Owner”) and the \_\_\_\_\_ (the “Funding Authority”) that it understands the goods and services under this Agreement are being funded with federal monies and have statutory requirements commonly known as “Build America, Buy America,” that requires all of the iron and steel, manufactured products, and construction materials used in the project to be produced in the United States (“Build America, Buy America Requirements”) including iron and steel, manufactured products, and construction materials provided by the Contractor pursuant to this Agreement. The Contractor hereby represents and warrants to and for the benefit of the Owner and Funding Authority (a) the Contractor has reviewed and understands the Build America, Buy America Requirements, (b) all of the iron and steel, manufactured products, and construction materials used in the project will be and/or have been produced in the United States in a manner that complies with the Build America, Buy America Requirements, unless a waiver of the requirements is approved, and (c) the Contractor will provide any further verified information, certification or assurance of compliance with this paragraph, or information necessary to support a waiver of the Build America, Buy America Requirements, as may be requested by the Owner or the Funding Authority. Notwithstanding any other provision of this Agreement, any failure to comply with this paragraph by the Contractor shall permit the Owner or Funding Authority to recover as damages against the Contractor any loss, expense, or cost (including without limitation attorney’s fees) incurred by the Owner or Funding Authority resulting from any such failure (including without limitation any impairment or loss of funding, whether in whole or in part, from the Funding Authority or any damages owed to the Funding Authority by the Owner). If the Contractor has no direct contractual privity with the Funding Authority, as a lender or awardee to the Owner for the funding of its project, the Owner and the Contractor agree that the Funding Authority is a third-party beneficiary and neither this paragraph (nor any other provision of this Agreement necessary to give this paragraph force or effect) shall be amended or waived without the prior written consent of the Funding Authority.

## APPENDIX 2

### Example Build America, Buy America (BABA) Act Assistance Agreement Language

ALL FEDERAL FINANCIAL INFRASTRUCTURE ASSISTANCE AGREEMENTS MUST HAVE A CLAUSE REQUIRING COMPLIANCE WITH THE BABA REQUIREMENTS. THIS IS AN EXAMPLE OF WHAT COULD BE INCLUDED IN AN ASSISTANCE AGREEMENT (E.G., SRF LOAN AGREEMENT). EPA MAKES NO CLAIMS REGARDING THE LEGAL SUFFICIENCY OF THIS CLAUSE WITH RESPECT TO STATE LAW:

Comply with all federal requirements applicable to the assistance received (including those imposed by the Infrastructure Investment and Jobs Act (“IIJA”), Public Law No. 117-58) which the Participant understands includes, but is not limited to, the following requirements: that all of the iron and steel, manufactured products, and construction materials used in the Project are to be produced in the United States (“Build America, Buy America Requirements”) unless (i) the Participant has requested and obtained a waiver from the cognizant Agency<sup>[1]</sup> pertaining to the Project or the Project is otherwise covered by a general applicability waiver; or (ii) all of the contributing Agencies have otherwise advised the Participant in writing that the Build America, Buy America Requirements are not applicable to the Project.

Comply with all record keeping and reporting requirements under all applicable legal authorities, including any reports required by the funding authority (such as EPA and/or a state), such as performance indicators of program deliverables, information on costs and project progress. The Participant understands that (i) each contract and subcontract related to the Project is subject to audit by appropriate federal and state entities and (ii) failure to comply with the applicable legal requirements and this Agreement may result in a default hereunder that results in a repayment of the assistance agreement in advance of the maturity of the Bonds, termination and/or repayment of grants, cooperative agreements, direct assistance or other types of financial assistance, and/or other remedial actions.

<sup>[1]</sup> From OMB Guidance M-22-11: To avoid a need for duplicative waiver requests from entities that receive funding for one infrastructure project through multiple Federal agencies, the Federal agency contributing the greatest amount of Federal funds for the project should be considered the “Cognizant Agency for Made in America” and should take responsibility for coordinating with the other Federal awarding agencies. Such coordination will provide uniform waiver criteria and adjudication processes, minimize duplicative efforts among Federal agencies, and reduce burdens on recipients. The Cognizant Agency for Made in America shall be responsible for consulting with the other Federal awarding agencies, publicizing the proposed joint waiver, and submitting the proposed joint waiver for review to MIAO.

# APPENDIX I AMERICAN IRON AND STEEL (AIS) REQUIREMENTS

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

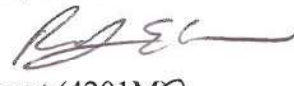

WASHINGTON, D.C. 20460

MAR 20 2014

OFFICE OF WATER

## MEMORANDUM

SUBJECT: Implementation of American Iron and Steel provisions of P.L. 113-76, Consolidated Appropriations Act, 2014

FROM: *for* Andrew D. Sawyers, Director   
Office of Wastewater Management (4201M)

Peter C. Grevatt, Director   
Office of Ground Water and Drinking Water (4601M)

TO: Water Management Division Directors  
Regions I - X

P.L. 113-76, Consolidated Appropriations Act, 2014 (Act), includes an “American Iron and Steel (AIS)” requirement in section 436 that requires Clean Water State Revolving Loan Fund (CWSRF) and Drinking Water State Revolving Loan Fund (DWSRF) assistance recipients to use iron and steel products that are produced in the United States for projects for the construction, alteration, maintenance, or repair of a public water system or treatment works if the project is funded through an assistance agreement executed beginning January 17, 2014 (enactment of the Act), through the end of Federal Fiscal Year 2014.

Section 436 also sets forth certain circumstances under which EPA may waive the AIS requirement. Furthermore, the Act specifically exempts projects where engineering plans and specifications were approved by a State agency prior to January 17, 2014.

The approach described below explains how EPA will implement the AIS requirement. The first section is in the form of questions and answers that address the types of projects that must comply with the AIS requirement, the types of products covered by the AIS requirement, and compliance. The second section is a step-by-step process for requesting waivers and the circumstances under which waivers may be granted.

## Implementation

The Act states:

Sec. 436. (a)(1) None of the funds made available by a State water pollution control revolving fund as authorized by title VI of the Federal Water Pollution Control Act (33 U.S.C. 1381 et seq.) or made available by a drinking water treatment revolving loan fund as authorized by section 1452 of the Safe Drinking Water Act (42 U.S.C. 300j-12) shall be used for a project for the construction, alteration, maintenance, or repair of a public water system or treatment works unless all of the iron and steel products used in the project are produced in the United States.

(2) In this section, the term “iron and steel products” means the following products made primarily of iron or steel: lined or unlined pipes and fittings, manhole covers and other municipal castings, hydrants, tanks, flanges, pipe clamps and restraints, valves, structural steel, reinforced precast concrete, and construction materials.

(b) Subsection (a) shall not apply in any case or category of cases in which the Administrator of the Environmental Protection Agency (in this section referred to as the “Administrator”) finds that—

(1) applying subsection (a) would be inconsistent with the public interest;

(2) iron and steel products are not produced in the United States in sufficient and reasonably available quantities and of a satisfactory quality; or

(3) inclusion of iron and steel products produced in the United States will increase the cost of the overall project by more than 25 percent.

(c) If the Administrator receives a request for a waiver under this section, the Administrator shall make available to the public on an informal basis a copy of the request and information available to the Administrator concerning the request, and shall allow for informal public input on the request for at least 15 days prior to making a finding based on the request. The Administrator shall make the request and accompanying information available by electronic means, including on the official public Internet Web site of the Environmental Protection Agency.

(d) This section shall be applied in a manner consistent with United States obligations under international agreements.

(e) The Administrator may retain up to 0.25 percent of the funds appropriated in this Act for the Clean and Drinking Water State Revolving Funds for carrying out

the provisions described in subsection (a)(1) for management and oversight of the requirements of this section.

(f) This section does not apply with respect to a project if a State agency approves the engineering plans and specifications for the project, in that agency's capacity to approve such plans and specifications prior to a project requesting bids, prior to the date of the enactment of this Act.

The following questions and answers provide guidance for implementing and complying with the AIS requirements:

### **Project Coverage**

#### **1) What classes of projects are covered by the AIS requirement?**

All treatment works projects funded by a CWSRF assistance agreement, and all public water system projects funded by a DWSRF assistance agreement, from the date of enactment through the end of Federal Fiscal Year 2014, are covered. The AIS requirements apply to the entirety of the project, no matter when construction begins or ends. Additionally, the AIS requirements apply to all parts of the project, no matter the source of funding.

#### **2) Does the AIS requirement apply to nonpoint source projects or national estuary projects?**

No. Congress did not include an AIS requirement for nonpoint source and national estuary projects unless the project can also be classified as a 'treatment works' as defined by section 212 of the Clean Water Act.

#### **3) Are any projects for the construction, alteration, maintenance, or repair of a public water system or treatment works excluded from the AIS requirement?**

Any project, whether a treatment works project or a public water system project, for which engineering plans and specifications were approved by the responsible state agency prior to January 17, 2014, is excluded from the AIS requirements.

#### **4) What if the project does not have approved engineering plans and specifications but has signed an assistance agreement with a CWSRF or DWSRF program prior to January 17, 2014?**

The AIS requirements do not apply to any project for which an assistance agreement was signed prior to January 17, 2014.

**5) What if the project does not have approved engineering plans and specifications, but bids were advertised prior to January 17, 2014 and an assistance agreement was signed after January 17, 2014?**

If the project does not require approved engineering plans and specifications, the bid advertisement date will count in lieu of the approval date for purposes of the exemption in section 436(f).

**6) What if the assistance agreement that was signed prior to January 17, 2014, only funded a part of the overall project, where the remainder of the project will be funded later with another SRF loan?**

If the original assistance agreement funded any construction of the project, the date of the original assistance agreement counts for purposes of the exemption. If the original assistance agreement was only for planning and design, the date of that assistance agreement will count for purposes of the exemption only if there is a written commitment or expectation on the part of the assistance recipient to fund the remainder of the project with SRF funds.

**7) What if the assistance agreement that was signed prior to January 17, 2014, funded the first phase of a multi-phase project, where the remaining phases will be funded by SRF assistance in the future?**

In such a case, the phases of the project will be considered a single project if all construction necessary to complete the building or work, regardless of the number of contracts or assistance agreements involved, are closely related in purpose, time and place. However, there are many situations in which major construction activities are clearly undertaken in phases that are distinct in purpose, time, or place. In the case of distinct phases, projects with engineering plans and specifications approval or assistance agreements signed prior to January 17, 2014 would be excluded from AIS requirements while those approved/signed on January 17, 2014, or later would be covered by the AIS requirements.

**8) What if a project has split funding from a non-SRF source?**

Many States intend to fund projects with “split” funding, from the SRF program and from State or other programs. Based on the Act language in section 436, which requires that American iron and steel products be used in any project for the construction, alteration, maintenance, or repair of a public water system or treatment works receiving SRF funding between and including January 17, 2014 and September 30, 2014, any project that is funded in whole or in part with such funds must comply with the AIS requirement. A “project” consists of all construction necessary to complete the building or work regardless of the number of contracts or assistance agreements involved so long as all contracts and assistance agreements awarded are closely related in purpose, time and place. This precludes the intentional splitting of SRF projects into separate and smaller contracts or assistance agreements to avoid AIS coverage on some portion of a larger

project, particularly where the activities are integrally and proximately related to the whole. However, there are many situations in which major construction activities are clearly undertaken in separate phases that are distinct in purpose, time, or place, in which case, separate contracts or assistance agreement for SRF and State or other funding would carry separate requirements.

**9) What about refinancing?**

If a project began construction, financed from a non-SRF source, prior to January 17, 2014, but is refinanced through an SRF assistance agreement executed on or after January 17, 2014 and prior to October 1, 2014, AIS requirements will apply to all construction that occurs on or after January 17, 2014, through completion of construction, unless, as is likely, engineering plans and specifications were approved by a responsible state agency prior to January 17, 2014. There is no retroactive application of the AIS requirements where a refinancing occurs for a project that has completed construction prior to January 17, 2014.

**10) Do the AIS requirements apply to any other EPA programs, besides the SRF program, such as the Tribal Set-aside grants or grants to the Territories and DC?**

No, the AIS requirement only applies to funds made available by a State water pollution control revolving fund as authorized by title VI of the Federal Water Pollution Control Act (33 U.S.C. 1381 et seq.) or made available by a drinking water treatment revolving loan fund as authorized by section 1452 of the Safe Drinking Water Act (42 U.S.C. 300j-12)

**Covered Iron and Steel Products**

**11) What is an iron or steel product?**

For purposes of the CWSRF and DWSRF projects that must comply with the AIS requirement, an iron or steel product is one of the following made primarily of iron or steel that is permanently incorporated into the public water system or treatment works:

- Lined or unlined pipes or fittings;
- Manhole Covers;
- Municipal Castings (defined in more detail below);
- Hydrants;
- Tanks;
- Flanges;
- Pipe clamps and restraints;
- Valves;
- Structural steel (defined in more detail below);
- Reinforced precast concrete; and
- Construction materials (defined in more detail below).

**12) What does the term ‘primarily iron or steel’ mean?**

‘Primarily iron or steel’ places constraints on the list of products above. For one of the listed products to be considered subject to the AIS requirements, it must be made of greater than 50% iron or steel, measured by cost. The cost should be based on the material costs.

**13) Can you provide an example of how to perform a cost determination?**

For example, the iron portion of a fire hydrant would likely be the bonnet, body and shoe, and the cost then would include the pouring and casting to create those components. The other material costs would include non-iron and steel internal workings of the fire hydrant (i.e., stem, coupling, valve, seals, etc). However, the assembly of the internal workings into the hydrant body would not be included in this cost calculation. If one of the listed products is not made primarily of iron or steel, United States (US) provenance is not required. An exception to this definition is reinforced precast concrete, which is addressed in a later question.

**14) If a product is composed of more than 50% iron or steel, but is not listed in the above list of items, must the item be produced in the US? Alternatively, must the iron or steel in such a product be produced in the US?**

The answer to both question is no. Only items on the above list must be produced in the US. Additionally, the iron or steel in a non-listed item can be sourced from outside the US.

**15) What is the definition of steel?**

Steel means an alloy that includes at least 50 percent iron, between .02 and 2 percent carbon, and may include other elements. Metallic elements such as chromium, nickel, molybdenum, manganese, and silicon may be added during the melting of steel for the purpose of enhancing properties such as corrosion resistance, hardness, or strength. The definition of steel covers carbon steel, alloy steel, stainless steel, tool steel and other specialty steels.

**16) What does ‘produced in the United States’ mean?**

Production in the United States of the iron or steel products used in the project requires that all manufacturing processes, including application of coatings, must take place in the United States, with the exception of metallurgical processes involving refinement of steel additives. All manufacturing processes includes processes such as melting, refining, forming, rolling, drawing, finishing, fabricating and coating. Further, if a domestic iron and steel product is taken out of the US for any part of the manufacturing process, it becomes foreign source material. However, raw materials such as iron ore, limestone and iron and steel scrap are not covered by the AIS requirement, and the

material(s), if any, being applied as a coating are similarly not covered. Non-iron or steel components of an iron and steel product may come from non-US sources. For example, for products such as valves and hydrants, the individual non-iron and steel components do not have to be of domestic origin.

**17) Are the raw materials used in the production of iron or steel required to come from US sources?**

No. Raw materials, such as iron ore, limestone, scrap iron, and scrap steel, can come from non-US sources.

**18) If an above listed item is primarily made of iron or steel, but is only at the construction site temporarily, must such an item be produced in the US?**

No. Only the above listed products made primarily of iron or steel, permanently incorporated into the project must be produced in the US. For example trench boxes, scaffolding or equipment, which are removed from the project site upon completion of the project, are not required to be made of U.S. Iron or Steel.

**19) What is the definition of ‘municipal castings’?**

Municipal castings are cast iron or steel infrastructure products that are melted and cast. They typically provide access, protection, or housing for components incorporated into utility owned drinking water, storm water, wastewater, and surface infrastructure. They are typically made of grey or ductile iron, or steel. Examples of municipal castings are:

- Access Hatches;
- Ballast Screen;
- Benches (Iron or Steel);
- Bollards;
- Cast Bases;
- Cast Iron Hinged Hatches, Square and Rectangular;
- Cast Iron Riser Rings;
- Catch Basin Inlet;
- Cleanout/Monument Boxes;
- Construction Covers and Frames;
- Curb and Corner Guards;
- Curb Openings;
- Detectable Warning Plates;
- Downspout Shoes (Boot, Inlet);
- Drainage Grates, Frames and Curb Inlets;
- Inlets;
- Junction Boxes;
- Lampposts;
- Manhole Covers, Rings and Frames, Risers;

Meter Boxes;  
Service Boxes;  
Steel Hinged Hatches, Square and Rectangular;  
Steel Riser Rings;  
Trash receptacles;  
Tree Grates;  
Tree Guards;  
Trench Grates; and  
Valve Boxes, Covers and Risers.

## **20) What is ‘structural steel’?**

Structural steel is rolled flanged shapes, having at least one dimension of their cross-section three inches or greater, which are used in the construction of bridges, buildings, ships, railroad rolling stock, and for numerous other constructional purposes. Such shapes are designated as wide-flange shapes, standard I-beams, channels, angles, tees and zees. Other shapes include H-piles, sheet piling, tie plates, cross ties, and those for other special purposes.

## **21) What is a ‘construction material’ for purposes of the AIS requirement?**

Construction materials are those articles, materials, or supplies made primarily of iron and steel, that are permanently incorporated into the project, not including mechanical and/or electrical components, equipment and systems. Some of these products may overlap with what is also considered “structural steel”. This includes, but is not limited to, the following products: wire rod, bar, angles, concrete reinforcing bar, wire, wire cloth, wire rope and cables, tubing, framing, joists, trusses, fasteners (i.e., nuts and bolts), welding rods, decking, grating, railings, stairs, access ramps, fire escapes, ladders, wall panels, dome structures, roofing, ductwork, surface drains, cable hanging systems, manhole steps, fencing and fence tubing, guardrails, doors, and stationary screens.

## **22) What is not considered a ‘construction material’ for purposes of the AIS requirement?**

Mechanical and electrical components, equipment and systems are not considered construction materials. Mechanical equipment is typically that which has motorized parts and/or is powered by a motor. Electrical equipment is typically any machine powered by electricity and includes components that are part of the electrical distribution system.

The following examples (including their appurtenances necessary for their intended use and operation) are NOT considered construction materials: pumps, motors, gear reducers, drives (including variable frequency drives (VFDs)), electric/pneumatic/manual accessories used to operate valves (such as electric valve actuators), mixers, gates, motorized screens (such as traveling screens), blowers/aeration equipment, compressors, meters, sensors, controls and switches, supervisory control and

data acquisition (SCADA), membrane bioreactor systems, membrane filtration systems, filters, clarifiers and clarifier mechanisms, rakes, grinders, disinfection systems, presses (including belt presses), conveyors, cranes, HVAC (excluding ductwork), water heaters, heat exchangers, generators, cabinetry and housings (such as electrical boxes/enclosures), lighting fixtures, electrical conduit, emergency life systems, metal office furniture, shelving, laboratory equipment, analytical instrumentation, and dewatering equipment.

**23) If the iron or steel is produced in the US, may other steps in the manufacturing process take place outside of the US, such as assembly?**

No. Production in the US of the iron or steel used in a listed product requires that all manufacturing processes must take place in the United States, except metallurgical processes involving refinement of steel additives.

**24) What processes must occur in the US to be compliant with the AIS requirement for reinforced precast concrete?**

While reinforced precast concrete may not be at least 50% iron or steel, in this particular case, the reinforcing bar and wire must be produced in the US and meet the same standards as for any other iron or steel product. Additionally, the casting of the concrete product must take place in the US. The cement and other raw materials used in concrete production are not required to be of domestic origin.

If the reinforced concrete is cast at the construction site, the reinforcing bar and wire are considered to be a construction material and must be produced in the US.

**Compliance**

**25) How should an assistance recipient document compliance with the AIS requirement?**

In order to ensure compliance with the AIS requirement, specific AIS contract language must be included in each contract, starting with the assistance agreement, all the way down to the purchase agreements. Sample language for assistance agreements and contracts can be found in Appendix 3 and 4.

EPA recommends the use of a step certification process, similar to one used by the Federal Highway Administration. The step certification process is a method to ensure that producers adhere to the AIS requirement and assistance recipients can verify that products comply with the AIS requirement. The process also establishes accountability and better enables States to take enforcement actions against violators.

Step certification creates a paper trail which documents the location of the manufacturing process involved with the production of steel and iron materials. A step certification is a process under which each handler (supplier, fabricator, manufacturer,

processor, etc) of the iron and steel products certifies that their step in the process was domestically performed. Each time a step in the manufacturing process takes place, the manufacturer delivers its work along with a certification of its origin. A certification can be quite simple. Typically, it includes the name of the manufacturer, the location of the manufacturing facility where the product or process took place (not its headquarters), a description of the product or item being delivered, and a signature by a manufacturer's responsible party. Attached, as Appendix 5, are sample certifications. These certifications should be collected and maintained by assistance recipients.

Alternatively, the final manufacturer that delivers the iron or steel product to the worksite, vendor, or contractor, may provide a certification asserting that all manufacturing processes occurred in the US. While this type of certification may be acceptable, it may not provide the same degree of assurance. Additional documentation may be needed if the certification is lacking important information. Step certification is the best practice.

## **26) How should a State ensure assistance recipients are complying with the AIS requirement?**

In order to ensure compliance with the AIS requirement, States SRF programs must include specific AIS contract language in the assistance agreement. Sample language for assistance agreements can be found in Appendix 3.

States should also, as a best practice, conduct site visits of projects during construction and review documentation demonstrating proof of compliance which the assistance recipient has gathered.

## **27) What happens if a State or EPA finds a non-compliant iron and/or steel product permanently incorporated in the project?**

If a potentially non-compliant product is identified, the State should notify the assistance recipient of the apparent unauthorized use of the non-domestic component, including a proposed corrective action, and should be given the opportunity to reply. If unauthorized use is confirmed, the State can take one or more of the following actions: request a waiver where appropriate; require the removal of the non-domestic item; or withhold payment for all or part of the project. Only EPA can issue waivers to authorize the use of a non-domestic item. EPA may use remedies available to it under the Clean Water Act, the Safe Drinking Water Act, and 40 CFR part 31 grant regulations, in the event of a violation of a grant term and condition.

It is recommended that the State work collaboratively with EPA to determine the appropriate corrective action, especially in cases where the State is the one who identifies the item in noncompliance or there is a disagreement with the assistance recipient.

If fraud, waste, abuse, or any violation of the law is suspected, the Office of Inspector General (OIG) should be contacted immediately. The OIG can be reached at 1-

888-546-8740 or [OIG\\_Hotline@epa.gov](mailto:OIG_Hotline@epa.gov). More information can be found at this website: <https://oig.hhs.gov/fraud/report-fraud/>

## **28) How do international trade agreements affect the implementation of the AIS requirements?**

The AIS provision applies in a manner consistent with United States obligations under international agreements. Typically, these obligations only apply to direct procurement by the entities that are signatories to such agreements. In general, SRF assistance recipients are not signatories to such agreements, so these agreements have no impact on this AIS provision. In the few instances where such an agreement applies to a municipality, that municipality is under the obligation to determine its applicability and requirements and document the actions taken to comply for the State.

### **Waiver Process**

The statute permits EPA to issue waivers for a case or category of cases where EPA finds (1) that applying these requirements would be inconsistent with the public interest; (2) iron and steel products are not produced in the US in sufficient and reasonably available quantities and of a satisfactory quality; or (3) inclusion of iron and steel products produced in the US will increase the cost of the overall project by more than 25 percent.

In order to implement the AIS requirements, EPA has developed an approach to allow for effective and efficient implementation of the waiver process to allow projects to proceed in a timely manner. The framework described below will allow States, on behalf of the assistance recipients, to apply for waivers of the AIS requirement directly to EPA Headquarters. Only waiver requests received from states will be considered. Pursuant to the Act, EPA has the responsibility to make findings as to the issuance of waivers to the AIS requirements.

### **Definitions**

The following terms are critical to the interpretation and implementation of the AIS requirements and apply to the process described in this memorandum:

Reasonably Available Quantity: The quantity of iron or steel products is available or will be available at the time needed and place needed, and in the proper form or specification as specified in the project plans and design.

Satisfactory Quality: The quality of iron or steel products, as specified in the project plans and designs.

Assistance Recipient: A borrower or grantee that receives funding from a State CWSRF or DWSRF program.

## Step-By-Step Waiver Process

### Application by Assistance Recipient

Each local entity that receives SRF water infrastructure financial assistance is required by section 436 of the Act to use American made iron and steel products in the construction of its project. However, the recipient may request a waiver. Until a waiver is granted by EPA, the AIS requirement stands, except as noted above with respect to municipalities covered by international agreements.

The waiver process begins with the SRF assistance recipient. In order to fulfill the AIS requirement, the assistance recipient must in good faith design the project (where applicable) and solicit bids for construction with American made iron and steel products. It is essential that the assistance recipient include the AIS terms in any request for proposals or solicitations for bids, and in all contracts (see Appendix 3 for sample construction contract language). The assistance recipient may receive a waiver at any point before, during, or after the bid process, if one or more of three conditions is met:

1. Applying the American Iron and Steel requirements of the Act would be inconsistent with the public interest;
2. Iron and steel products are not produced in the United States in sufficient and reasonably available quantities and of a satisfactory quality; or
3. Inclusion of iron and steel products produced in the United States will increase the cost of the overall project by more than 25 percent.

Proper and sufficient documentation must be provided by the assistance recipient. A checklist detailing the types of information required for a waiver to be processed is attached as Appendix 1.

Additionally, it is strongly encouraged that assistance recipients hold pre-bid conferences with potential bidders. A pre-bid conference can help to identify iron and steel products needed to complete the project as described in the plans and specifications that may not be available from domestic sources. It may also identify the need to seek a waiver prior to bid, and can help inform the recipient on compliance options.

In order to apply for a project waiver, the assistance recipient should email the request in the form of a Word document (.doc) to the State SRF program. It is strongly recommended that the State designate a single person for all AIS communications. The State SRF designee will review the application for the waiver and determine whether the necessary information has been included. Once the waiver application is complete, the State designee will forward the application to either of two email addresses. For CWSRF waiver requests, please send the application to: [cwsrfwaiver@epa.gov](mailto:cwsrfwaiver@epa.gov). For DWSRF waiver requests, please send the application to: [dwsrfwaiver@epa.gov](mailto:dwsrfwaiver@epa.gov).

## Evaluation by EPA

After receiving an application for waiver of the AIS requirements, EPA Headquarters will publish the request on its website for 15 days and receive informal comment. EPA Headquarters will then use the checklist in Appendix 2 to determine whether the application properly and adequately documents and justifies the statutory basis cited for the waiver – that it is quantitatively and qualitatively sufficient – and to determine whether or not to grant the waiver.

In the event that EPA finds that adequate documentation and justification has been submitted, the Administrator may grant a waiver to the assistance recipient. EPA will notify the State designee that a waiver request has been approved or denied as soon as such a decision has been made. Granting such a waiver is a three-step process:

1. Posting – After receiving an application for a waiver, EPA is required to publish the application and all material submitted with the application on EPA’s website for 15 days. During that period, the public will have the opportunity to review the request and provide informal comment to EPA. The website can be found at: [http://water.epa.gov/grants\\_funding/aisrequirement.cfm](http://water.epa.gov/grants_funding/aisrequirement.cfm)
2. Evaluation – After receiving an application for waiver of the AIS requirements, EPA Headquarters will use the checklist in Appendix 2 to determine whether the application properly and adequately documents and justifies the statutory basis cited for the waiver – that it is quantitatively and qualitatively sufficient – and to determine whether or not to grant the waiver.
3. Signature of waiver approval by the Administrator or another agency official with delegated authority – As soon as the waiver is signed and dated, EPA will notify the State SRF program, and post the signed waiver on our website. The assistance recipient should keep a copy of the signed waiver in its project files.

## Public Interest Waivers

EPA has the authority to issue public interest waivers. Evaluation of a public interest waiver request may be more complicated than that of other waiver requests so they may take more time than other waiver requests for a decision to be made. An example of a public interest waiver that might be issued could be for a community that has standardized on a particular type or manufacturer of a valve because of its performance to meet their specifications. Switching to an alternative valve may require staff to be trained on the new equipment and additional spare parts would need to be purchased and stocked, existing valves may need to be unnecessarily replaced, and portions of the system may need to be redesigned. Therefore, requiring the community to install an alternative valve would be inconsistent with public interest.

EPA also has the authority to issue a public interest waiver that covers categories of products that might apply to all projects.

EPA reserves the right to issue national waivers that may apply to particular classes of assistance recipients, particular classes of projects, or particular categories of iron or steel products. EPA may develop national or (US geographic) regional categorical waivers through the identification of similar circumstances in the detailed justifications presented to EPA in a waiver request or requests. EPA may issue a national waiver based on policy decisions regarding the public's interest or a determination that a particular item is not produced domestically in reasonably available quantities or of a sufficient quality. In such cases, EPA may determine it is necessary to issue a national waiver.

If you have any questions concerning the contents of this memorandum, you may contact us, or have your staff contact Jordan Dorfman, Attorney-Advisor, State Revolving Fund Branch, Municipal Support Division, at [dorfman.jordan@epa.gov](mailto:dorfman.jordan@epa.gov) or (202) 564-0614 or Kiri Anderer, Environmental Engineer, Infrastructure Branch, Drinking Water Protection Division, at [anderer.kirsten@epa.gov](mailto:anderer.kirsten@epa.gov) or (202) 564-3134.

**Attachment 1: Information Checklist for Waiver Request**

The purpose of this checklist is to help ensure that all appropriate and necessary information is submitted to EPA. EPA recommends that States review this checklist carefully and provide all appropriate information to EPA. This checklist is for informational purposes only and does not need to be included as part of a waiver application.

Items	✓	Notes
<p><b>General</b></p> <ul style="list-style-type: none"> <li>• Waiver request includes the following information:               <ul style="list-style-type: none"> <li>— Description of the foreign and domestic construction materials</li> <li>— Unit of measure</li> <li>— Quantity</li> <li>— Price</li> <li>— Time of delivery or availability</li> <li>— Location of the construction project</li> <li>— Name and address of the proposed supplier</li> <li>— A detailed justification for the use of foreign construction materials</li> </ul> </li> <li>• Waiver request was submitted according to the instructions in the memorandum</li> <li>• Assistance recipient made a good faith effort to solicit bids for domestic iron and steel products, as demonstrated by language in requests for proposals, contracts, and communications with the prime contractor</li> </ul>	✓	
<p><b>Cost Waiver Requests</b></p> <ul style="list-style-type: none"> <li>• Waiver request includes the following information:               <ul style="list-style-type: none"> <li>— Comparison of overall cost of project with domestic iron and steel products to overall cost of project with foreign iron and steel products</li> <li>— Relevant excerpts from the bid documents used by the contractors to complete the comparison</li> <li>— Supporting documentation indicating that the contractor made a reasonable survey of the market, such as a description of the process for identifying suppliers and a list of contacted suppliers</li> </ul> </li> </ul>		
<p><b>Availability Waiver Requests</b></p> <ul style="list-style-type: none"> <li>• Waiver request includes the following supporting documentation necessary to demonstrate the availability, quantity, and/or quality of the materials for which the waiver is requested:               <ul style="list-style-type: none"> <li>— Supplier information or pricing information from a reasonable number of domestic suppliers indicating availability/delivery date for construction materials</li> <li>— Documentation of the assistance recipient's efforts to find available domestic sources, such as a description of the process for identifying suppliers and a list of contacted suppliers.</li> <li>— Project schedule</li> <li>— Relevant excerpts from project plans, specifications, and permits indicating the required quantity and quality of construction materials</li> </ul> </li> <li>• Waiver request includes a statement from the prime contractor and/or supplier confirming the non-availability of the domestic construction materials for which the waiver is sought</li> <li>• Has the State received other waiver requests for the materials described in this waiver request, for comparable projects?</li> </ul>		

**Attachment 2: HQ Review Checklist for Waiver Request**

Instructions: To be completed by EPA. Review all waiver requests using the questions in the checklist, and mark the appropriate box as Yes, No or N/A. Marks that fall inside the shaded boxes may be grounds for denying the waiver. If none of your review markings fall into a shaded box, the waiver is eligible for approval if it indicates that one or more of the following conditions applies to the domestic product for which the waiver is sought:

1. The iron and/or steel products are not produced in the United States in sufficient and reasonably available quantities and of a satisfactory quality.
2. The inclusion of iron and/or steel products produced in the United States will increase the cost of the overall project by more than 25 percent.

Review Items	Yes	No	N/A	Comments
<p><b>Cost Waiver Requests</b></p> <ul style="list-style-type: none"> <li>• Does the waiver request include the following information?                             <ul style="list-style-type: none"> <li>— Comparison of overall cost of project with domestic iron and steel products to overall cost of project with foreign iron and steel products</li> <li>— Relevant excerpts from the bid documents used by the contractors to complete the comparison</li> <li>— A sufficient number of bid documents or pricing information from domestic sources to constitute a reasonable survey of the market</li> </ul> </li> <li>• Does the Total Domestic Project exceed the Total Foreign Project Cost by more than 25%?</li> </ul>				
<p><b>Availability Waiver Requests</b></p> <ul style="list-style-type: none"> <li>• Does the waiver request include supporting documentation sufficient to show the availability, quantity, and/or quality of the iron and/or steel product for which the waiver is requested?                             <ul style="list-style-type: none"> <li>— Supplier information or other documentation indicating availability/delivery date for materials</li> <li>— Project schedule</li> <li>— Relevant excerpts from project plans, specifications, and permits indicating the required quantity and quality of materials</li> </ul> </li> <li>• Does supporting documentation provide sufficient evidence that the contractors made a reasonable effort to locate domestic suppliers of materials, such as a description of the process for identifying suppliers and a list of contacted suppliers?</li> <li>• Based on the materials delivery/availability date indicated in the supporting documentation, will the materials be unavailable when they are needed according to the project schedule? (By item, list schedule date and domestic delivery quote date or other relevant information)</li> <li>• Is EPA aware of any other evidence indicating the non-availability of the materials for which the waiver is requested?</li> </ul> <p><b>Examples include:</b></p> <ul style="list-style-type: none"> <li>— Multiple waiver requests for the materials described in this waiver request, for comparable projects in the same State</li> <li>— Multiple waiver requests for the materials described in this waiver request, for comparable projects in other States</li> <li>— Correspondence with construction trade associations indicating the non-availability of the materials</li> </ul> <ul style="list-style-type: none"> <li>• Are the available domestic materials indicated in the bid documents of inadequate quality compared those required by the project plans, specifications, and/or permits?</li> </ul>				

### **Attachment 3: Example Loan Agreement Language**

ALL ASSISTANCE AGREEMENT MUST HAVE A CLAUSE REQUIRING COMPLIANCE WITH THE AIS REQUIREMENT. THIS IS AN EXAMPLE OF WHAT COULD BE INCLUDED IN SRF ASSISTANCE AGREEMENTS. EPA MAKES NO CLAIMS REGARDING THE LEGALITY OF THIS CLAUSE WITH RESPECT TO STATE LAW:

Comply with all federal requirements applicable to the Loan (including those imposed by the 2014 Appropriations Act and related SRF Policy Guidelines) which the Participant understands includes, among other, requirements that all of the iron and steel products used in the Project are to be produced in the United States (“American Iron and Steel Requirement”) unless (i) the Participant has requested and obtained a waiver from the Agency pertaining to the Project or (ii) the Finance Authority has otherwise advised the Participant in writing that the American Iron and Steel Requirement is not applicable to the Project.

Comply with all record keeping and reporting requirements under the Clean Water Act/Safe Drinking Water Act, including any reports required by a Federal agency or the Finance Authority such as performance indicators of program deliverables, information on costs and project progress. The Participant understands that (i) each contract and subcontract related to the Project is subject to audit by appropriate federal and state entities and (ii) failure to comply with the Clean Water Act/Safe Drinking Water Act and this Agreement may be a default hereunder that results in a repayment of the Loan in advance of the maturity of the Bonds and/or other remedial actions.

#### Attachment 4: Sample Construction Contract Language

ALL CONTRACTS MUST HAVE A CLAUSE REQUIRING COMPLIANCE WITH THE AIS REQUIREMENT. THIS IS AN EXAMPLE OF WHAT COULD BE INCLUDED IN ALL CONTRACTS IN PROJECTS THAT USE SRF FUNDS. EPA MAKES NO CLAIMS REGARDING THE LEGALITY OF THIS CLAUSE WITH RESPECT TO STATE OR LOCAL LAW:

The Contractor acknowledges to and for the benefit of the City of \_\_\_\_\_ (“Purchaser”) and the \_\_\_\_\_ (the “State”) that it understands the goods and services under this Agreement are being funded with monies made available by the Clean Water State Revolving Fund and/or Drinking Water State Revolving Fund that have statutory requirements commonly known as “American Iron and Steel;” that requires all of the iron and steel products used in the project to be produced in the United States (“American Iron and Steel Requirement”) including iron and steel products provided by the Contractor pursuant to this Agreement. The Contractor hereby represents and warrants to and for the benefit of the Purchaser and the State that (a) the Contractor has reviewed and understands the American Iron and Steel Requirement, (b) all of the iron and steel products used in the project will be and/or have been produced in the United States in a manner that complies with the American Iron and Steel Requirement, unless a waiver of the requirement is approved, and (c) the Contractor will provide any further verified information, certification or assurance of compliance with this paragraph, or information necessary to support a waiver of the American Iron and Steel Requirement, as may be requested by the Purchaser or the State. Notwithstanding any other provision of this Agreement, any failure to comply with this paragraph by the Contractor shall permit the Purchaser or State to recover as damages against the Contractor any loss, expense, or cost (including without limitation attorney’s fees) incurred by the Purchaser or State resulting from any such failure (including without limitation any impairment or loss of funding, whether in whole or in part, from the State or any damages owed to the State by the Purchaser). While the Contractor has no direct contractual privity with the State, as a lender to the Purchaser for the funding of its project, the Purchaser and the Contractor agree that the State is a third-party beneficiary and neither this paragraph (nor any other provision of this Agreement necessary to give this paragraph force or effect) shall be amended or waived without the prior written consent of the State.

## Attachment 5: Sample Certification 1

The following information is provided as a sample letter of certification for BABA and AIS compliance. Documentation must be provided on company letterhead.

Date

Company Name

Company Address

City, State Zip

Subject: BABA and AIS Certification for Project (XXXXXXXXXX)

I, (company representative), certify that the (melting, bending, coating, galvanizing, cutting, etc.) process for (manufacturing or fabricating) the following products and/or materials shipped or provided for the subject project is in full compliance with the American Iron and Steel requirement as mandated in EPA's State Revolving Fund Programs.

BIL extends this procurement requirement to all construction projects going forward with the inclusion of the Build America, Buy America Act (BABA). Starting on May 14, 2022, all steel, iron, manufactured products, non-ferrous metals, plastic and polymer-based products (including polyvinylchloride, composite building materials, and polymers used in fiber optic cables), glass (including optic glass), lumber, and drywall used in infrastructure projects for federal financial assistance programs must be produced in the United States.

Item, Products and/or Materials:

1. XXXX
2. XXXX
3. XXXX

Such process took place at the following location:

If any of the above compliance statements change while providing material to this project we will immediately notify the prime contractor and the engineer.

Signed by company representative

## Attachment 5: Sample Certification 2

The following information is provided as a sample letter of certification for BABA and AIS compliance. Documentation must be provided on company letterhead.

Date

Company Name

Company Address

City, State Zip

Subject: BABA and AIS Certification for Project (XXXXXXXXXX)

I, (company representative), certify that the following products and/or materials shipped/provided to the subject project are in full compliance with the American Iron and Steel requirement as mandated in EPA's State Revolving Fund Programs.

BIL extends this procurement requirement to all construction projects going forward with the inclusion of the Build America, Buy America Act (BABA). Starting on May 14, 2022, all steel, iron, manufactured products, non-ferrous metals, plastic and polymer-based products (including polyvinyl chloride, composite building materials, and polymers used in fiber optic cables), glass (including optic glass), lumber, and drywall used in infrastructure projects for federal financial assistance programs must be produced in the United States.

Item, Products and/or Materials:

1. XXXX
2. XXXX
3. XXXX

Such process took place at the following location:

If any of the above compliance statements change while providing material to this project we will immediately notify the prime contractor and the engineer.

Signed by company representative

## APPENDIX J

### Massachusetts COVID-19 Guidelines

# **Supplemental Guidelines for Construction Sites**

## **ADDENDUM 1 Limiting Exposures and Worker Infection Protocol**

### **COVID-19 Employee Health, protection, guidance and prevention**

#### **Limiting Exposures**

Workers should follow the General On-the-Job Guidance to Prevent Exposure & Limit the Transmission of the Virus of the COVID-19 Employee Health, protection, guidance and prevention guide.

In addition, Contractors should advise workers of best practice to limit exposures off the construction site.

When leaving a construction site for breaks, lunch, or other reasons are required to wash hands with soap for at least 20 seconds or use an alcohol-based hand sanitizer with at least 60% ethanol or 70% isopropanol before leaving the site and must maintain social distancing if traveling to other locations off the construction site. Frequent use of handwashing or alcohol-based hand sanitizers should be encouraged and handwashing facilities and/or alcohol-based hand sanitizers should be made readily available at work sites.

#### **Worker Infection Protocol**

As provided in the guidance document, there is a zero tolerance for sick workers reporting to work. Employees should be instructed that even those with mild symptoms of respiratory infection (cough, shortness of breath, sore throat) or fever should stay off work. Contractors shall take immediate steps to limit infections at the job site in the event that a worker discovered to have tested positive for COVID-19 or has COVID-19 related symptoms.

Although it is understood that contractors are enforcing Work Site Risk Prevention Practices including social distancing rules and use of PPE, consistent with guidelines it is also recognized that there may be occasions where someone who has tested positive for COVID-19 or who has COVID-19 symptoms has been present in a work area..

Prompt identification and isolation of potentially infectious individuals is a critical step in protecting workers, vendors, visitors, and others at a worksite.

#### **IDENTIFICATION OF EXPOSURE**

The Contractor shall direct workers with COVID-19 related symptoms to leave the jobsite immediately and contact their healthcare provider. The Massachusetts Department of Health (DPH) or a local board of health will make appropriate notifications to those who had direct prolonged contact with the COVID-19 positive workers.

The Contractor shall work with the local board of health to identify any potential jobsite exposures, including :

- Other workers , vendors, inspectors, or visitors to the work site with close contact to the individual
- Work areas such as supply cabinets and designated work stations or rooms
- Work tools and equipment
- Common areas such as break rooms and tables, vending machines, and sanitary facilities

## **NOTIFICATION AND QUARANTINE REQUIREMENTS**

As provided by law, the identity of the worker must be kept confidential.

Upon learning of an infection, the contractor must immediately notify the designated COVID-19 safety officer, the site safety officer, and the owner.

## **SANITIZATION REQUIREMENTS**

Contractor shall take immediate steps to sanitize common areas and direct work places. This includes all on-site bathrooms facilities, any break facilities, and any other common areas on the job site that may have been in close contact with the infected worker.

Sanitation will be conducted with personnel, equipment, and material approved for COVID-19 sanitization.

Identified areas should remain isolated from workers until sanitation process has been completed and area is deemed safe for use.

## **RETURNING TO WORK**

All impacted workers should follow CDC and DPH recommended steps concerning return to work. Workers who are considered close contacts to a COVID19 case by public health authorities should not return for 14 days and are subject quarantine by public health.

Workers who leave during the work day due to COVID-19 symptoms and develop COVID-19 as confirmed by laboratory testing or diagnosis by a healthcare provider shall not return to the site until either released from isolation by healthcare provider or public health.

## **IN ALL CASES**

Keep all employee names confidential as required by law.

Other employees may be sent home while a workspace is being cleaned but will return to work after cleaning unless advised otherwise by a health care provider.

Other employees should be asked to contact their health provider if they have any questions. Remind other employees to continue to practice proper sanitation and monitor for flu like symptoms.

## Enforcement of the COVID-19 Safety Guidelines and Procedures for Construction Sites

COVID-19 Order No. 13, as revised and extended on March 31, 2020, requires the Massachusetts Department of Transportation and the Division of Capital Asset Management and Maintenance to “issue guidance and enforcement procedures for the safe operation of public works construction sites.” The safety guidance is attached as “COVID-19 Guidelines and Procedures for All Construction Sites and Workers at All Public Works Sites” (hereinafter, the COVID-19 Construction Safety Guidance) and is posted online and may be revised from time to time. This document contains the required enforcement procedures, which shall be followed by all state agencies and authorities who undertake, manage or fund construction projects and may be used by each city or town for ensuring the safety of both publicly- and privately-owned construction projects.

- All Projects: Construction sites that cannot consistently comply with the COVID-19 Construction Safety Guidance , including ensuring that social distancing and safety requirements are being followed, must:
  - Safely secure the site and pause construction activities until a corrective action plan is prepared, submitted and approved by both the Owner and the city or town; or
  - Close down the site for the duration of the State of Emergency if repeatedly found by either the Owner’s COVID-19 Officer or a state or local inspector (including a third-party private inspector accountable to a city or town) to be in violation of the social distancing and safety requirements.
- A city or town may additionally require the Owner to develop and submit a site-specific risk analysis and enhanced COVID-19 safety plan. The city or town shall review and approve such plan and may require such projects to pause construction until such a risk analysis and plan is submitted and approved. Once such an enhanced COVID-19 safety plan is approved, a violation of the plan shall be treated the same as a violation of the COVID-19 Construction Safety Guidance.
- A site-specific COVID-19 Officer (who may also be the Health and Safety Officer) shall be designated for every site.
- The approved project Health and Safety Plan (HASP) shall be modified to require that the Contractor’s site-specific project COVID-19 Officer submit a written daily report to the Owner’s Representative. The COVID-19 Officer shall certify that the contractor and all subcontractors are in full compliance with the COVID-19 Construction Safety Guidance.
- Public Projects: For all projects undertaken, managed or funded by a state agency or authority there shall be joint enforcement responsibility between the project’s public Owner and the city or town where the project is located.
  - The Owner of the project has the lead responsibility for compliance and enforcement including frequent on-site inspections by an employee or contractor of the state agency or authority who is familiar with the COVID-19 Construction Safety Guidance and is authorized to enforce that guidance and shut down work at the site if violations are found.
  - The Owner of the project is required to notify the municipality where the work is taking place whenever a site is shut down or of any violations of the COVID-19 Construction

Safety Guidance and the resulting corrective action plan, as well as to provide copies of the COVID-19 Officer's written daily reports upon request.

- While the public Owner has the lead responsibility for enforcement, cities and towns retain the authority to take enforcement action against public projects found not in compliance with the COVID-19 Construction Safety Guidance, including the authority to order the project to shut down until a corrective action plan is developed, approved and implemented.
- Private Projects: For all private projects the primary enforcement responsibility rests with the city or town, with the Massachusetts Department of Transportation and other state agencies providing technical assistance and resource support.
  - Cities and towns are authorized to enforce the COVID-19 Construction Safety Guidance using their public health staff, building inspectors or any other appropriate official or contractor.
  - Cities and towns may enforce the safety and distance protocols including requiring the Owner and/or Contractor to safely secure the site and pause construction activities until a corrective action plan is prepared, submitted and approved by the city or town.
  - The city or town may require the Owner of a private project to pay for an independent, third party inspector or inspection firm (or to pay into a pool to pay for such inspections). The third party inspector shall be accountable solely to the city or town and shall be responsible for enforcement on behalf of the city or town. A city or town may require private projects to pause construction until such a third-party inspector has been secured.

Any questions about these enforcement procedures or the accompanying Guidance can be directed to:

For MassDOT, Michael McGrath, Assistant Administrator for Construction Engineering, [michael.a.mcgrath@state.ma.us](mailto:michael.a.mcgrath@state.ma.us)

For DCAMM, Jay Mitchell, Deputy Commissioner, [Jayson.mitchell@mass.gov](mailto:Jayson.mitchell@mass.gov)

# COVID-19 Employee Health, protection, guidance and prevention

**The following applies to both State employees and contracted staff working on behalf of the State.**

These Guidelines and Procedures MUST be implemented at all times on all construction sites. All construction sites MUST conduct a Safety Stand Down day to disseminate these Guidelines to all employees and workers.

## **Employee Health Protection – ZERO Tolerance**

**ZERO TOLERANCE FOR SICK WORKERS REPORTING TO WORK. IF YOU ARE SICK, STAY HOME! IF YOU FEEL SICK, GO HOME! IF YOU SEE SOMEONE SICK, SEND THEM HOME!**

If you are exhibiting any of the symptoms below, you are to report this to your supervisor (via phone, text or email) right away, and head home from the job site or stay home if already there.

If you notice a co-worker showing signs or complaining about such symptoms, he or she should be directed to their supervisor (via phone, text or email) and asked to leave the project site immediately.

## **COVID-19 Typical Symptoms:**

- Fever
- Cough
- Shortness of Breath
- Sore Throat

## **Self-certify prior to shift**

Prior to starting a shift, each employee will self-certify to their supervisor that they:

- Have no signs of a fever or a measured temperature above 100.3 degrees or greater, a cough or trouble breathing within the past 24 hours.
- Have not had "close contact" with an individual diagnosed with COVID-19. "Close contact" means living in the same household as a person who has tested positive for COVID-19, caring for a person who has tested positive for COVID-19, being within 6 feet of a person who has tested positive for COVID-19 for about 15 minutes, or coming in direct contact with secretions (e.g., sharing utensils, being coughed on) from a person who has tested positive for COVID-19, while that person was symptomatic.
- Have not been asked to self-isolate or quarantine by their doctor or a local public health official.

Workers that are working in a confined space or inside a closed building envelope will have to be temperature screened by a Medical Professional or Trained Individual provided that such screening is out of public view to respect privacy and results are kept private.

Employees exhibiting symptoms or unable to self-certify should be directed to leave the work site and seek medical attention and applicable testing by their health care provider. They are not to return to the work site until cleared by a medical professional.

## **General On-the-Job Guidance to Prevent Exposure & Limit the Transmission of the Virus**

- No handshaking
- Wash hands often with soap for at least 20 seconds or use an alcohol-based hand sanitizer with at least 60% ethanol or 70% isopropanol
- Contractor and State Agency Field Offices are locked down to all but authorized personnel
- Each jobsite should develop cleaning and decontamination procedures that are posted and shared. These Procedures must cover all areas including trailers, gates, equipment, vehicles, etc. and shall be posted at all entry points to the sites, and throughout the project site.
- A "No Congregation" policy is in effect, individuals must implement social distancing by maintaining a minimum distance of 6-feet from other individuals

- Avoid face to face meetings – critical situations requiring in-person discussion must follow social distancing
- Conduct all meetings via conference calls, if possible. Do not convene meetings of more than 10 people. Recommend use of cell phones, texting, web meeting sites and conference calls for project discussion
- All individual work crew meetings/tailgate talks should be held outside and follow social distancing
- Please keep all crews a minimum of 6’ apart at all times to eliminate the potential of cross contamination
- At each job briefing/tool box talk, employees are asked if they are experiencing any symptoms, and are sent home if they are
- Each jobsite should have laminated COVID-19 safety guidelines and handwashing instructions
- All restroom facilities/porta-potties should be cleaned and handwashing stations must be provided with soap, hand sanitizer and paper towels
- All surfaces should be regularly cleaned, including surfaces, door handles, laptops, etc.
- All common areas and meeting areas are to be regularly cleaned and disinfected at least once a day but preferably twice a day
- Be sure to use your own water bottle, and do not share
- To avoid external contamination, we recommend everyone bring food from home
- Please maintain Social Distancing separation during breaks and lunch.
- Cover coughing or sneezing with a tissue, then throw the tissue in the trash and wash hands, if no tissue is available then cough into your elbow
- Avoid touching eyes, nose, and mouth with your hands
- To avoid sharing germs, please clean up after Yourself. DO NOT make others responsible for moving, unpacking and packing up your personal belongings
- If you or a family member is feeling ill, stay home!

#### **Work Site Risk Prevention Practices**

- At the start of each shift, confirm with all employees that they are healthy.
- We will have a 100% glove policy from today going forward. All construction workers will be required to wear cut-resistant gloves or the equivalent.
- Use of eye protection (safety goggles/face shields) is recommended
- In work conditions where required social distancing is impossible to achieve affected employees shall be supplied PPE including as appropriate a standard face mask, gloves, and eye protection.
- All employees shall drive to work site/parking area in a single occupant vehicle. Contractors / State staff shall not ride together in the same vehicle
- When entering a machine or vehicle which you are not sure you were the last person to enter, make sure that you wipe down the interior and door handles with disinfectant prior to entry
- In instances where it is possible, workers should maintain separation of 6’ from each other per CDC guidelines.
- Multi person activities will be limited where feasible (two person lifting activities)
- Large gathering places on the site such as shacks and break areas will be eliminated and instead small break areas will be used with seating limited to ensure social distancing.
- Contact the cleaning person for your office trailer or office space and ensure they have proper COVID- 19 sanitation processes. Increase their cleaning visits to daily
- Clean all high contact surfaces a minimum of twice a day in order to minimize the spread of germs in areas that people touch frequently. This includes but is not limited to desks, laptops and vehicles

#### **Wash Stations**

All site-specific projects with outside construction sites without ready access to an indoor bathroom MUST install Wash Stations.

- Install hand wash stations with hot water, if possible, and soap at fire hydrants or other water sources to be used for frequent handwashing for all onsite employees
- All onsite workers must help to maintain and keep stations clean

- If a worker notices soap or towels are running low or out, immediately notify supervisors
- Garbage barrels will be placed next to the hand wash station for disposal of tissues/towels

Do all you can to maintain your good health by: getting adequate sleep; eating a balanced, healthy diet, avoid alcohol; and consume plenty of fluids.

Please Note: This document is not intended to replace any formalized procedures currently in place with the General Contractor.

Where these guidance does not meet or exceed the standards put forth by the General Contractor, everyone shall abide by the most stringent procedure available.

A site-specific COVID-19 Officer (who may also be the Health and Safety Officer) shall be designated for every site.

The approved project Health and Safety Plan (HASP) shall be modified to require that the Contractor's sitespecific project COVID-19 Officer submit a written daily report to the Owner's Representative. The COVID-19 Officer shall certify that the contractor and all subcontractors are in full compliance with these guidelines.

Any issue of non-compliance with these guidelines shall be a basis for the suspension of work. The contractor will be required to submit a corrective action plan detailing each issue of non-conformance and a plan to rectify the issue(s). The contractor will not be allowed to resume work until the plan is approved by the Owner. Any additional issues of non-conformance may be subject to action against the contractor's prequalification and certification status.

## **1.0 PURPOSE AND SCOPE OF WORK**

Axiom Partners, Inc. (AXIOM) was retained by Environmental Partners to perform a hazardous buildings materials inspection of the referenced buildings in advance of planned property redevelopment activities.

The purpose of this investigation was to identify Asbestos-Containing Materials (ACMs), Lead-Containing Paint (LCP), Polychlorinated Biphenyls (PCBs), Mercury (Hg), Chlorofluorocarbons (CFCs) and other miscellaneous hazardous materials and wastes for abatement prior to or in conjunction with planned property redevelopment activities.

## **2.0 SITE DESCRIPTION**

The pump houses are either brick or CMU block construction with asphaltic roofing. The buildings are occupied and currently being used as pump houses. The roof of Building 4 consists of rubber membrane covering concrete and is flat. The roofs of Buildings 2 and 3 and the corrosives buildings are asphaltic shingles. The exterior walls of the buildings are brick, concrete, and CMU.

The interior consists primarily of concrete floors with plaster or suspended ceiling tile ceilings. Interior walls are a combination of painted CMU, brick, and concrete. The vast majority of the floors are unfinished concrete.

## **3.0 INSPECTION PERSONNEL, METHODS AND LABORATORY**

### **3.1 Inspection Personnel and Process**

#### *3.1.1 Inspection Personnel*

The investigative survey was conducted on March 8, 2023, by experienced and Massachusetts Department of Labor Standards (DLS) licensed Asbestos Inspector, Geoff Gerace (Massachusetts Asbestos Inspector License Number AI034620). Mr. Gerace was assisted by inspector Jeff Albert also from AXIOM.

#### *3.1.2 Inspection Process*

The inspection for ACMs and hazardous buildings materials (HBMs) was conducted in a systematic manner using AXIOM's standard safety procedures and inspection protocols including:

1. A visual inspection of the buildings' interiors and exteriors to locate, quantify and assess the condition of materials suspected to contain asbestos, lead, PCBs, CFCs, Mercury and other hazardous chemicals, materials and wastes.
2. Collection and analysis of materials as described herein to determine their composition.
3. Review of previous asbestos survey and post-abatement reports, sampling reports and laboratory analysis for ACMs. None were ascertained.

### **3.2 Asbestos-Containing Materials (ACM) Investigation**

3.2.1 *Methodology*

The inspection for suspect ACMs included:

1. Collection of representative bulk samples of each homogeneous application of suspect material in sufficient numbers to comply with EPA/AHERA criteria (see Chart A below).
2. To prevent release of any airborne asbestos, samples of suspect friable materials were collected by wetting the suspect materials and then removing a small full-thickness sample and placing it in a sealed plastic bag labeled with a unique sample identification number.
3. Chain-of-custody documentation was used to ensure sample integrity.
4. Analysis of the bulk samples by an accredited laboratory using the EPA-approved Polarized Light Microscopy (PLM) method.
5. A review of the inspection findings and lab results to ensure proper and consistent identification and characterization of all confirmed and presumed ACMs.

**Chart A**  
**Minimum Asbestos Bulk Sampling Criteria**

Type of Suspect Material <sup>1</sup>	Minimum Sampling Criteria
Surfacing	EPA/AHERA mandated statistically random criteria (Min. of 3 samples; Max. of 7 samples)
Miscellaneous	A sufficient number of samples to determine if material is an ACM (typically 2 samples of each homogeneous application)
Thermal System Insulations	Three random samples of each homogeneous material

3.2.2 *Definition of Key Inspection Terms*

Given the specific purposes and objectives of this inspection, the following definitions were used for the terms: Suspect Materials, Non-Suspect Materials, Homogeneous Applications or Areas, Inaccessible Buildings Areas, and Confirmed ACMs:

1. Suspect Materials: Installed buildings materials that either were pre-formed (i.e., manufactured off-site) or were prepared and installed on-site. All buildings materials are considered to be suspect ACMs except as noted in #2 below.
2. Non-Suspect Materials: For the purposes of this inspection, the following materials were considered non-suspect and were not assessed or sampled if observed:
  - Plastic
  - Glass
  - Wood or Wood Composite Materials
  - Clay or Ceramic Tiles
  - Rubber or Synthetic Foam
  - Paint (unless textured)

---

<sup>1</sup> Per homogeneous material or area

- Brick, Granite, Marble, or Other Stonework
- Concrete or Mortar (except Gyp-Crete)
- Pink or Yellow Fiberglass Insulation on Pipes or Other Mechanical Components
- Carpeting, Curtains, Wallpaper, and Other Paper/Natural Fiber, Fabric, or Synthetics

3. Homogeneous Applications or Areas: Are suspect materials which serve the same function or purpose (e.g., floor or ceiling tiles) have similar color and texture and were likely installed at or near the same time. Note that the homogeneity of certain materials such as wall and ceiling plaster at times cannot be readily determined.
4. Inaccessible Buildings Areas: As this was a due-diligence survey, AXIOM was not able to get into all buildings areas, or to investigate all systems, structural components, or surfaces. Additionally, there were other areas that AXIOM could not survey because it was unsafe or impractical to disassemble or remove systems or coverings or because a human being cannot physically enter or observe the area or components. These areas include, but are not limited to, Transite pipes coming on to the site from municipal utilities mains from the surrounding streets, underground trenches, boilers, vessels, storage tanks and mechanical systems.
5. Confirmed ACMs: Suspect materials where at least one of the bulk samples contains an asbestos concentration equal to<sup>2</sup> or greater than 1%. According to the EPA/AHERA criteria, if all bulk samples of a homogeneous area of material are found to contain less than 1% asbestos, the material may be classified as a non-asbestos material.
6. Friable and Non-Friable ACMs: An ACM that can be crumbled, crushed or otherwise reduced to powder by hand pressure is a friable material; non-friable ACMs cannot. This is important with respect to managing ACMs. Additionally, some non-friable ACMs are regulated differently.
7. Asbestos-Containing Waste Material (ACWM): The Commonwealth of Massachusetts Department of Environmental Protection (MADEP) defines an ACWM as "any ACM removed during a demolition or renovation project and anything contaminated with asbestos in the course of a demolition or renovation project including, but not limited to, asbestos waste from control devices, bags or containers that previously contained asbestos, contaminated clothing, materials used to enclose the work area during the demolition or renovation operation, and demolition or renovation debris. Asbestos-Containing Waste Material (ACWM) shall also include ACM on and/or in facility components that are inoperable or have been taken out of service and any ACM that is damaged or deteriorated to the point where it is no longer attached as originally applied or is no longer serving the intended purpose for which it was originally installed."

### **3.3 Asbestos Laboratory Services**

#### *3.3.1 PLM Bulk Sample Analysis*

Bulk samples collected during the inspection were submitted to and analyzed by Optimum Analytical, Inc. (OPTIMUM) located in Salem, New Hampshire. OPTIMUM is a Massachusetts-licensed asbestos bulk sample laboratory (License #AA000175). Bulk samples were analyzed for

---

<sup>2</sup> Massachusetts regulations define an ACM as a material with 1% or greater asbestos. EPA defines an ACM as a material with greater than 1% asbestos.

asbestos content using EPA Method 600/R-93/116. A chain-of-custody form was used to ensure sample integrity.

The entire inventory of collected samples may not have required analysis. Initially, one sample per material was analyzed. If the first sample was found to contain asbestos, the remaining samples were not analyzed (*Positive Stop* protocol). If the first sample was determined not to contain asbestos, however, the remaining samples were analyzed until >1% asbestos was detected or until the entire sample set was analyzed.

### **3.4 Lead Containing Paint (LCP) Investigation**

Representative testing of paints for the presence of lead was performed in the buildings as part of AXIOM's scope of work.

#### *3.4.1 Introduction*

Historically, lead was added to paint because its color stability properties made it a desirable pigment and because it enhances durability. Lead-Containing Paint (LCP) becomes harmful when ingested or inhaled as dust or fumes. Once lead was proven to be a health hazard, it was officially banned in 1978 from paints used in residences.

In an occupational setting, if lead-based painted surfaces are to be impacted by renovation or demolition activities, contractor personnel exposure (per OSHA compliance) and waste disposal (per EPA compliance) issues must be addressed and factored into the cost of the project.

#### *3.4.2 Testing Methodology*

AXIOM utilized a Portable X-Ray Fluorescence Analyzer (XRF) to perform the lead paint survey. The XRF is a hand-held instrument that contains a radioisotopic source and operates on the principle of X-ray fluorescence. The depression of a spring-loaded trigger mechanism on the XRF unit opens a shutter in the face-plate that allows radiation from an isotopic source to stimulate the lead atoms in the paint. This stimulation causes the atoms to emit (fluoresce) X-rays which the unit detects and converts into electrical pulses which are then processed, and the result is read through a digital display on the instrument.

AXIOM used a NITON Model XLp300 which analyzes surfaces quickly, accurately and non-destructively. Surface levels of lead are measured in milligrams per square centimeter (mg/cm<sup>2</sup>). This unit can measure the concentration of LCP on surfaces as little as 0.01 mg of lead/cm<sup>2</sup>.

#### *3.4.3 XRF Testing Procedures*

Upon arrival at the site, a "validation test" was performed to ensure that the XRF instrument was operating properly. The validation test was performed on a calibration test sheet supplied by the manufacturer to determine if the instrument is consistently measuring lead content. During this survey, the XRF was functioning properly as defined by the manufacturer.

In conducting the LCP survey representative tests were performed on homogeneous (similar color and use) painted surfaces. Results were related to other surfaces possessing similar homogeneous characteristics. By following this sampling protocol, every painted surface did not have to be tested.

Representative testing was performed for the presence of lead-based paint (LBP) and lead-containing paint (LCP) on accessible interior and exterior painted surfaces.

### **3.5 Polychlorinated Biphenyls (PCBs) Investigation**

AXIOM conducted an inspection of the buildings and grounds to identify suspect PCB-containing fluorescent light fixture ballasts, electrical transformers and bulk products. The survey was conducted in a systematic manner that included:

1. Performing a detailed walk-through to inspect and categorize the various types of accessible fluorescent light fixtures and electrical transformers.
2. Preparing an inventory of electrical light ballasts and transformers known or suspected to contain PCBs. Nameplate data was recorded if it was present and legible.
3. AXIOM inspected the buildings to identify suspect PCB-containing caulking. The survey included identifying and testing representative caulking compounds materials for PCBs. The bulk samples were collected using hand tools and placed into seal containers (glass sample jars) which were promptly labeled and placed into a cooler with ice. Samples were picked up at the site by a courier and hand delivered to NETLABS Laboratory located in West Warwick, RI for analysis. The samples were prepared using the Soxhlet extraction method and analyzed for PCBs by the Environmental Protection Agency (EPA) Methods 3540C and 8082. The complete laboratory reports can be found in Appendix A.

### **3.6 Mercury Light Tube and Thermostat Investigation**

AXIOM inspected the buildings to identify suspect Mercury-containing equipment as follows:

1. Preparing an inventory of fluorescent light bulbs that contain Mercury vapor in conjunction with the light ballast inspection described in Section 3.5.
2. Performing a walkthrough to identify and inventory thermostats, switches, actuators and other equipment that contain liquid Mercury.

### **3.7 Chlorofluorocarbons (CFCs) Investigation**

AXIOM inspected the buildings to identify suspect chlorofluorocarbons (CFCs) associated with refrigeration and air conditioning equipment and prepared an inventory of equipment including an estimate of CFC quantities. Nameplate data was recorded if it was present and legible. Assumptions were made if the unit was inaccessible or if the nameplate was not present or illegible.

### **3.8 Miscellaneous Hazardous Buildings Materials**

AXIOM inspected the buildings for miscellaneous hazardous buildings materials and chemical wastes including oil-containing devices (e.g. boilers, generators, elevators, motors, grease traps, etc.) and miscellaneous items such as lead acid batteries, paints, cleaners and other chemicals.

## **4.0 FINDINGS AND RECOMMENDATIONS**

#### 4.1 Asbestos-Containing Materials

##### 4.1.1 Asbestos-Containing Materials (ACMs)

Materials **confirmed** to contain  $\geq 1\%$  asbestos for the survey are as follows:

**TABLE 1  
CONFIRMED ACMs**

Sample Description	Sample Location	Sample Reference	Estimated Quantity <sup>3</sup>	Results <sup>4</sup>
030823-57-01A & B	Exterior Door Caulking	Exterior of Well Pump House #4	28 LF	1 @ 2% CHR 1 @ SNA
030823-57-03A&B	Exterior Window Caulking	Exterior of Well Pump House #4	2 Each	1 @ 3% CHR 1 @ SNA

##### 4.1.2 Presumed Asbestos-Containing Materials (PACMs)

The following presumed ACMs (PACMs) may be present in or on the buildings or at the site that could not be investigated or tested due to inaccessibility:

**TABLE 2  
PRESUMED ACMs**

Material	Location	Estimated Quantity	Friability
Buried Pipes	Beneath Buildings or at Site	TBD	TBD
Loose Fill Insulation (in CMU walls)	Various Areas of Buildings' Interiors	TBD	TBD
Concealed Caulkings & Sealants Behind Vinyl or Aluminum Window Frames	Various Areas Buildings' Exteriors	TBD	Friable
Concealed Pipe/Fitting Insulation Behind and Above Hard Ceilings and Walls	Various Areas of Buildings' Interiors	TBD	Friable
Built up Roofing	Well Pump House # 4	580 SF	Non-Friable

##### 4.1.3 Non-Asbestos-Containing Materials

Materials that are non-ACMs based on AXIOM's most recent survey are listed in Table 3 below:

**TABLE 3  
CONFIRMED NON-ACMS**

<sup>3</sup> SF = Square Feet; LF = Linear Feet; EA = Each; TBD = To be Determined;

<sup>4</sup> NAD = No Asbestos Detected; CHR = Chrysotile Asbestos; SNA = Sample not analyzed (Positive Stop)

Sample Reference	Material	Location(s)
030823-57-02A&B	Red Brick Mortar	Well Station #4, Pump House
030823-57-04A&B	2' x 4' White Fissured Ceiling Tile	Well Station #4, Pump House
030823-57-05A&B	Plaster Ceiling	Well Station #4, Pump House
030823-57-06A&B	CMU Block Mortar	Well Station #4, Chemical Storage Bldg
030823-57-07A&B	Black Asphalt Shingle	Well Station #4, Chemical Storage Bldg
030823-57-08A&B	Tar Paper Layer	Well Station #4, Chemical Storage Bldg
030823-57-10A&B	Red Brick Mortar	Well Station #2, Pump House
030823-57-11A&B	2' x 4' White Fissured Ceiling Tile	Well Station #2, Pump House
030823-57-12A&B	Textured Paint on Foundation	Well Station #2, Pump House
030823-57-13A&B	Fiber board Panels	Well Station #2, Pump House
030823-57-14A&B	CMU Block Mortar	Well Station #2, Chemical Storage Bldg
030823-57-15A&B	Gray Asphalt Shingle	Well Station #2, Chemical Storage Bldg
030823-57-16A&B	Tar Paper Layer	Well Station #2, Chemical Storage Bldg
030823-57-17A&B	Gray Asphalt Shingle	Well Station #2, Pump House
030823-57-18A&B	Tar Paper Layer	Well Station #2, Pump House
030823-57-19A&B	Roof Flashing Cement	Well Station #2, Pump House Vent
030823-57-20A&B	CMU Block Mortar	Well Station #3, Chemical Storage Bldg
030823-57-21A&B	Gray Asphalt Shingle	Well Station #3, Chemical Storage Bldg
030823-57-22A&B	Tar Paper Layer	Well Station #3, Chemical Storage Bldg
030823-57-23A&B	White Roof Coating	Well Station #3, Pump House
030823-57-24A&B	Red Brick Mortar	Well Station #3, Pump House
030823-57-25A&B	Exterior Door Caulking	Well Station #3, Pump House
030823-57-26A&B	Plaster Ceiling	Well Station #3, Pump House

#### 4.1.4 Discussion and Recommendations

The mere presence of asbestos in a building does not mean that the health of buildings occupants is necessarily at risk. As long as the ACMs remain in good condition and are not disturbed, exposure is unlikely. However, when buildings maintenance, repair, renovation, demolition or other activities disturb ACMs, or if ACMs are damaged, asbestos fibers are released creating a potential hazard to buildings occupants.

There were two (2) ACMs associated with Well Pump #4 building. There are also PACMs at the buildings that must be explored and/or tested to rule out the possibility that they contain asbestos. If the subject buildings are demolished and/or renovated, and if future testing proves that the PACMs contain asbestos, these ACMs must be removed by a Massachusetts-licensed Asbestos Removal Contractor prior to or in conjunction with the demolition work. As required by governing regulations, completion of each asbestos removal task must include a visual inspection by a

Massachusetts-licensed Asbestos Project Monitor and final clearance air testing if asbestos removal is performed inside a negative pressure enclosure (containment).

Regulations require that all ACMs be included in a site-specific asbestos operations and maintenance (O&M) program designed, at a minimum, to comply with 29 CFR 1910.1001 and 1926.1101, incorporating the basic components in the EPA's *Guide to Managing Asbestos in Buildings*. However, since all ACMs will imminently be removed during buildings demolition, the O&M program will not be required.

PACMs that may be present are identified in Table 2.

Removal of ACMs, PACMs and other HBMs should be clearly defined in a project specification which is used to obtain competitive bids for the work.

A detailed cost estimate for removal of ACMs, PACMs is present in Appendix E and includes an allowance for the removal of HBMs.

#### **4.2 Lead-Containing Paints (LCP)**

The HUD<sup>5</sup> lead paint standard classifies Lead Based Paint (LBP) as paint having  $\geq 1.0$  mg/cm<sup>2</sup> as measured by the XRF or  $\geq 0.5\%$  of lead by weight as analyzed by Atomic Absorption. With respect to renovation and demolition work, OSHA defines a lead-containing paint (LCP) as paint containing detectable amounts of lead.

Based on testing performed by AXIOM, several of the paints were found to contain detectable lead. The paints are generally in fair to good condition. A complete listing of the testing results can be found in Appendix B

Contractors should be made aware of the presence of lead paint testing results to satisfy the hazard communication requirements set forth by OSHA regulations. Specifically, contractors and subcontractors should be required to comply with OSHA regulation 29 CFR 1926.62 and Massachusetts regulation 453 CMR 22.11 for lead exposure in construction and 29 CFR 1926.59, *Hazard Communication for the Construction Industry*. This could be accomplished by providing the affected contractors with a copy of this report. The General Contractor is responsible for informing and managing their employees and subcontractors.

The current interpretation of the EPA's Resource Conservation and Recovery Act (RCRA) requires that waste generated during projects where LCPs are present and will be disposed of is tested for the toxicity characteristic of lead in the waste stream. TCLP<sup>6</sup> testing is performed to determine whether waste (construction/demolition debris) must be classified as hazardous because of its lead content or if it can be disposed in a conventional construction and demolition (C&D) landfill. The regulatory limit for lead toxicity is 5.0 milligrams per liter (mg/L) using the EPA Method SW846-7420 for Atomic Absorption Spectroscopy (AAS). Since the need for TCLP testing is typically determine by the disposal facility/landfill, AXIOM recommends that pre-disposal testing is the contractor's responsibility.

---

<sup>5</sup> U.S. Department of Housing and Urban Development

<sup>6</sup> Toxicity Characteristic Leachate Procedure (TCLP)

### **4.3 Polychlorinated Biphenyls (PCBs) and Mercury in Electrical Equipment**

#### *4.3.1 Fluorescent Light Fixtures*

AXIOM identified two (2) types of fluorescent light fixtures in the subject buildings. If there were ballasts labeled “No PCBs” they would be presumed to contain di (2-ethylhexyl) phthalate (DEHP). A summary of fluorescent light fixtures is provided in Appendix C.

Handling and disposal of fluorescent light ballasts that contain PCBs should be performed in accordance with the Massachusetts Universal Waste Management Standard (310 CMR 30.1034) and EPA’s Resource Conservation and Recovery Act (RCRA) and other governing regulations and requirements. There are two methods currently available for disposal of PCB-containing ballasts including incineration and disposal. Incineration is typically more expensive. Regardless of the method, documentation must be provided that verifies the proper removal, transportation, and disposal (destruction/incineration) at an approved facility. In general, PCB ballasts must be placed in 55-gallon drums which once filled, the drums must be closed and properly labeled for temporary storage, transport, and disposal in accordance with all applicable regulations. Drums containing PCB ballasts must be transported to an EPA-approved disposal facility (landfill or incinerator). Documentation must be provided that verifies the proper removal, transportation, and disposal (or destruction/incineration) at the approved facility. Drums containing non-PCB fluids, ballasts or capacitors shall be disposed of at a legally permitted disposal facility. There is presently no regulatory mandate for special handling and disposal of DEHP-containing ballasts, however, since there are a number of regulations that may be indirectly applicable<sup>7</sup> and since the disposal cost is not significant, AXIOM recommends disposing of DEHP-containing ballasts similarly.

#### *4.3.2 Transformers*

AXIOM did observe six (6) pole mounted transformers on the site. These wet-type pole mounted transformers are assumed to contain PCB’s.

#### *4.3.3 Mercury-Containing Items*

There are approximately thirty-four (34) fluorescent light bulbs associated with actual light fixtures in the subject buildings. A summary of mercury-containing items is provided in Appendix C.

Handling and disposal of fluorescent light bulbs that contain Mercury should be performed in accordance with the Massachusetts Universal Waste Management Standard (310 CMR 30.1034) and EPA’s Resource Conservation and Recovery Act (RCRA) and other governing regulations and requirements. Guidance documents are also available from the EPA (e.g. the 1994 Green Lights Program for Lighting Waste Disposal). If fluorescent lamps become broken or damaged during removal, the broken lamps should be managed as hazardous waste. Note that fluorescent light tubes may be reused.

Mercury-containing devices must be properly recycled in accordance with 310 CMR 30.1034.

---

<sup>7</sup> Environmental Protection Agency (EPA) Resource Conservation and Recovery Act (RCRA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or "Superfund"), Solid Waste Disposal Act, the Clean Water Act, Safe Drinking Water Act and the Toxic Substances Control Act.

#### 4.4 Chlorofluorocarbons (CFCs)

AXIOM did not observe CFCs in the subject buildings.

#### 4.5 Polychlorinated Biphenyls (PCBs) Testing

##### 4.5.1 Summary of PCB Bulk Product Testing Results

The following table provide the laboratory results of analysis of caulking for PCBs. The laboratory reports are in Appendix A.

**TABLE 3**  
**SUMMARY OF PCBs IN CAULKING COMPOUND RESULTS**

Sample Number	Description	Location	Analysis Results <sup>8</sup>
PCB-01	Exterior Window Caulking	Well Pump House # 4	ND
PCB-02	Exterior Door Caulking	Well Pump House # 3	ND
PCB-03	Exterior Window Caulking	Well Pump House # 3	ND

Laboratory results are reported in micrograms per kilograms ( $\mu\text{g}/\text{kg}$ ) which AXIOM converted to milligrams per kilograms ( $\text{mg}/\text{kg}$ ) which is equivalent to parts per million (ppm) for comparison to EPA definitions.

##### 4.5.2 Discussion

According to 40 CFR 761, the EPA specifies that products and materials containing greater than 50 ppm are PCB bulk products. Based on the results of this investigation, **none** of the buildings materials (e.g., caulking, glazing or sealants) are considered to be PCB bulk products.

#### 4.6 Miscellaneous Hazardous Wastes

##### 4.6.1 Miscellaneous Hazardous Materials/Wastes

AXIOM identified other hazardous materials/wastes including drums of chemicals, tanks of chemicals in the corrosive buildings and fire extinguishers. These items are also listed in Appendix C.

#### 5.0 LIMITATIONS AND EXCLUSIONS

##### 5.1 Limitations and Conditions of This Investigation

##### 5.1.1 NESHAPs Asbestos Survey

<sup>8</sup> ND = PCBs not detected at the Reporting Limit (RL) for the specific samples. Refer to lab report for PCB Reporting Limits; Results are reported in milligrams per kilogram ( $\text{mg}/\text{kg}$ ) which is equivalent to parts per million (ppm); all ND results include Aroclor 1016, 1221, 1232, 1242, 1248, 1254, 1260, 1262 and 1268 unless specifically noted otherwise.

This NESHAPs survey involved an investigation for ACMs in preparation for buildings demolition. Although this investigation attempted to identify and sample inaccessible buildings materials, some materials were inaccessible, and the potential remains that concealed ACMs may be encountered in the buildings or at the site.

#### *5.1.2 Inaccessible Materials and Locations*

Inaccessible buildings areas, systems, structural components, or surfaces which may not have been observed because it was unsafe or impractical to demolish, disassemble, or remove systems or coverings, or because a human being cannot physically enter or observe the area or component. Unless specifically noted, inaccessible materials or areas may include:

- buried or otherwise concealed pipe trenches and utility vaults/corridors;
- buried foundations;
- asphaltic roofing materials (field & flashings) under rubber membranes;
- enclosed wall and ceiling cavities;
- electrical equipment/wire;
- concealed mechanical materials; and
- remnant window and door caulking that have been replaced or in-filled.

AXIOM made every reasonable effort to address these potential ACMs. However, the potential remains that concealed ACMs could be encountered during renovation or demolition work.

#### *5.1.3 Other Environmental Exclusions*

1. This investigation did not include an assessment of air quality or analysis of soil, surface water or groundwater. Furthermore, this study did not include any subsurface exploration, testing or assessment for wetlands.
2. This investigation did not include assessments for the presence of pesticides, herbicides, urea-formaldehyde or Radon, nor any air quality monitoring, or any chemical analysis of soil, surface water, or groundwater at the Site.
3. No attempt was made to check the compliance of present or past owners of the Site with Federal, State, or local laws.
4. The testing for lead paint was performed by an experienced Industrial Hygienist. It is intended only to satisfy the requirements of OSHA regulations including 29 CFR 1926.62, *Lead Exposure in Construction: Interim Final Rule* and 29 CFR 1926.59, *Hazard Communication for the Construction Industry*. This investigation was not performed by an EPA HUD<sup>9</sup> or state accredited/licensed Lead Inspector which is often required for residential structures where children under the age of six live.

#### *5.1.4 Project Specifications*

---

<sup>9</sup> US Department of Housing and Urban Development

Users are cautioned that this document is an inspection report, not a project specification. Although it is often feasible to use a report such as this to obtain bids for asbestos and related abatement work, it does not provide a proper and/or complete document for defining the scope of work and specifying contractual obligations.

## APPENDIX A

### Asbestos Bulk and PCB Bulk Sample Results

Geoff Gerace  
Axiom Partners  
50 Salem Street Building B  
Lynnfield MA 01940

Project Reference: 01383.001  
Laboratory Batch #: 2346262  
Date Samples Received: 03/08/2023  
Date Samples Analyzed: 03/17/2023  
Date of Final Report: 03/17/2023

**SAMPLE IDENTIFICATION:**

Fifty (50) samples from Well Pump House #2, 3, 4; Various Sharon, MA project were submitted by Geoff Gerace on 03/08/2023

This bulk sample(s) was delivered to Optimum Analytical Consulting, LLC (Optimum) located in Salem, New Hampshire for asbestos content determination.

**ANALYTICAL METHOD:**

Analytical procedures were performed in accordance with the U.S. Environmental Protection Agency (EPA) Recommended Method for the Determination of Asbestos in Bulk Samples by Polarized Light Microscopy and Dispersion Staining (PLM/DS)(EPA-40 CFR Appendix E to Subpart E of Part 763, Interim Method of the Determination of Asbestos in Bulk Insulation Samples, EPA-600/ R-93-116 Method for Determination of Asbestos in Bulk Building Materials). This report relates only to those samples analyzed, and may not be indicative of other similar appearing materials existing at this, or other sites. Quantification of asbestos content was determined by Calibrated Visual Estimation. Optimum is not responsible for sample collection activities or analytical method limitations. The laboratory is not responsible for the accuracy of results when requested to physically separate and analyze layered samples.

In any given material, fibers with a small diameter (<0.25µm) may not be detected by the PLM method. Floor tile and other resinous bound materials may yield a false negative if the asbestos fibers are too small to be resolved using PLM. Additionally, there is currently no approved EPA analytical method to reliably confirm vermiculite as non-asbestos containing. Additional analytical methods may be required. Optimum Analytical recommends using Transmission Electron Microscopy (TEM) or other approved methods for a more definitive analysis.

Optimum will retain all samples for a minimum of three months. Further analysis or return of samples must be requested within this three month period to guarantee their availability. This report may not be reproduced except in full, without the written approval of Optimum Analytical and Consulting, LLC.

The client/laboratory shall not use the NVLAP and AIHA Logo or this test report in a way that constitutes or implies product certification, approval, or endorsement by the National Institute of Standards and Technology or the American Industrial Hygiene Association.

Detection Limit <1%, Reporting Limits: CVES = 1%, 400 Point Count = .25%, 1000 Point Count = 0.1%; Present or Absent are observations made during a qualitative analysis.

This report is considered preliminary until signed by both the Laboratory Analyst and Laboratory Director or Supervisor. If you have any questions regarding this report, please do not hesitate to contact us.

Jamie L. Noel  
Laboratory Director

## REPORT OF ANALYTICAL RESULTS

**NETLAB Work Order Number: 3C10007**  
**Client Project: 01383.001 - Town of Sharon Well Pump Houses**

Report Date: 17-March-2023

Prepared for:

Geoff Gerace  
Axiom Partners, Inc  
One Pleasure Island Road, Suite 2C  
Wakefield, MA 01880

rich.warila@newenglandtesting.com

### ***Samples Submitted :***

The samples listed below were submitted to New England Testing Laboratory on 03/10/23. The group of samples appearing in this report was assigned an internal identification number (case number) for laboratory information management purposes. The client's designations for the individual samples, along with our case numbers, are used to identify the samples in this report. This report of analytical results pertains only to the sample(s) provided to us by the client which are indicated on the custody record. The case number for this sample submission is 3C10007. Custody records are included in this report.

<b>Lab ID</b>	<b>Sample</b>	<b>Matrix</b>	<b>Date Sampled</b>	<b>Date Received</b>
3C10007-01	PCB-01	Solid (Misc)	03/08/2023	03/10/2023
3C10007-02	PCB-02	Solid (Misc)	03/08/2023	03/10/2023
3C10007-03	PCB-03	Solid (Misc)	03/08/2023	03/10/2023

## ***Request for Analysis***

At the client's request, the analyses presented in the following table were performed on the samples submitted.

### **PCB-01 (Lab Number: 3C10007-01)**

**Analysis**

PCBs (Soxhlet)

**Method**

EPA 8082A

### **PCB-02 (Lab Number: 3C10007-02)**

**Analysis**

PCBs (Soxhlet)

**Method**

EPA 8082A

### **PCB-03 (Lab Number: 3C10007-03)**

**Analysis**

PCBs (Soxhlet)

**Method**

EPA 8082A

## ***Method References***

*Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW846, USEPA*

## Case Narrative

### Sample Receipt:

The samples associated with this work order were received in appropriately cooled and preserved containers. The chain of custody was adequately completed and corresponded to the samples submitted.

Exceptions: None

### Analysis:

All samples were prepared and analyzed within method specified holding times and according to NETLAB's documented standard operating procedures. The results for the associated calibration, method blank and laboratory control sample (LCS) were within method specified quality control requirements and allowances. Results for all soil samples, unless otherwise indicated, are reported on a dry weight basis.

Exceptions: None

## Results: Polychlorinated Biphenyls (PCBs)

**Sample: PCB-01**

**Lab Number: 3C10007-01 (Non-soil solid, as received basis)**

### Affirmative Responses to Questions A through F are required for "Presumptive Certainty" status

<b>A</b>	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
<b>B</b>	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
<b>C</b>	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
<b>D</b>	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
<b>E</b>	VPH, EPH, APH, and TO-15 only a. VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications). b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Yes <input type="checkbox"/> No
<b>F</b>	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No

### Responses to Questions G, H and I below are required for "Presumptive Certainty" status

<b>G</b>	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <sup>1</sup>
----------	---	--

**Data User Note:** Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.

<b>H</b>	Were <b>all</b> QC performance standards specified in the CAM protocol(s) achieved?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <sup>1</sup>
<b>I</b>	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <sup>1</sup>

<sup>1</sup>All negative responses must be addressed in an attached laboratory narrative.

**I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, is accurate and complete.**

### **Asbestos and Hazardous Buildings Materials Abatement Cost Estimate**

**Asbestos & Hazardous Building Materials Abatement Cost Estimate  
Occupied Pump House Buildings  
Sharon, MA**

**Asbestos Removal ACMs**

Material	Location(s)	Estimated Quantity	Estimated Removal Cost
Exterior Door Caulking	Exterior of Well Pump House #4	28 LF	\$800
Exterior Window Caulking	Exterior of Well Pump House #4	2 Each	\$500
<b>Subtotal, ACM Removal</b>		<b>\$</b>	<b>4,500<sup>10</sup></b>

**Asbestos Removal, PACMs**

Material	Location	Estimated Quantity	Estimated Removal Cost
Flange Gaskets	Sprinkler System	45 Each	\$4,500
Asphaltic Damp Proofing	On Foundations, Footings	3,000 SF	\$20,000
Buried Pipes	Beneath Buildings or at Site	TBD	\$15,000
Loose Fill Insulation (in CMU walls)	Various Areas of Buildings' Interiors	TBD	NA*
Concealed Caulkings & Sealants Behind Vinyl or Aluminum Window Frames	Various Areas Buildings' Exteriors	TBD	NA*
Electrical Components	Interior of Pump Houses 2,3 &4	500 SF	\$4,000
<b>Subtotal, PACM Removal (Recommended Allowance)</b>			<b>\$ 43,500</b>

\*N/A – Not applicable at this time

**Abatement Cost Estimate Summary**

Description	Estimated Removal Cost
Asbestos Removal, Confirmed ACMs	\$ 4,500
Asbestos Removal, Presumed ACMs	\$ 43,500
Miscellaneous Hazardous Buildings Materials	\$ 15,000
~10% Contingency	\$ 6,000
Estimated Abatement Design/Bid & Monitoring Fee	\$ 3,000
<b>Total Hazardous Buildings Materials Abatement</b>	<b>\$ 72,000</b>

<sup>10</sup> Minimum Charge for an abatement contractor to mobilize and perform abatement.

**Asbestos & Hazardous Building Materials Abatement Cost Estimate  
Occupied Pump House Buildings  
Sharon, MA**

**Cost Estimate Assumptions**

- Based on current market conditions by a non-union contractor.
- Power, water and heat provided by the Owner.
- Does not include demolition to access concealed ACMs.
- Includes materials, labor, equipment, notifications/permits, transportation and disposal.
- Excludes the cost for removal of any other hazardous materials or conditions not identified herein.

## APPENDIX L

### Well Station Record Drawings

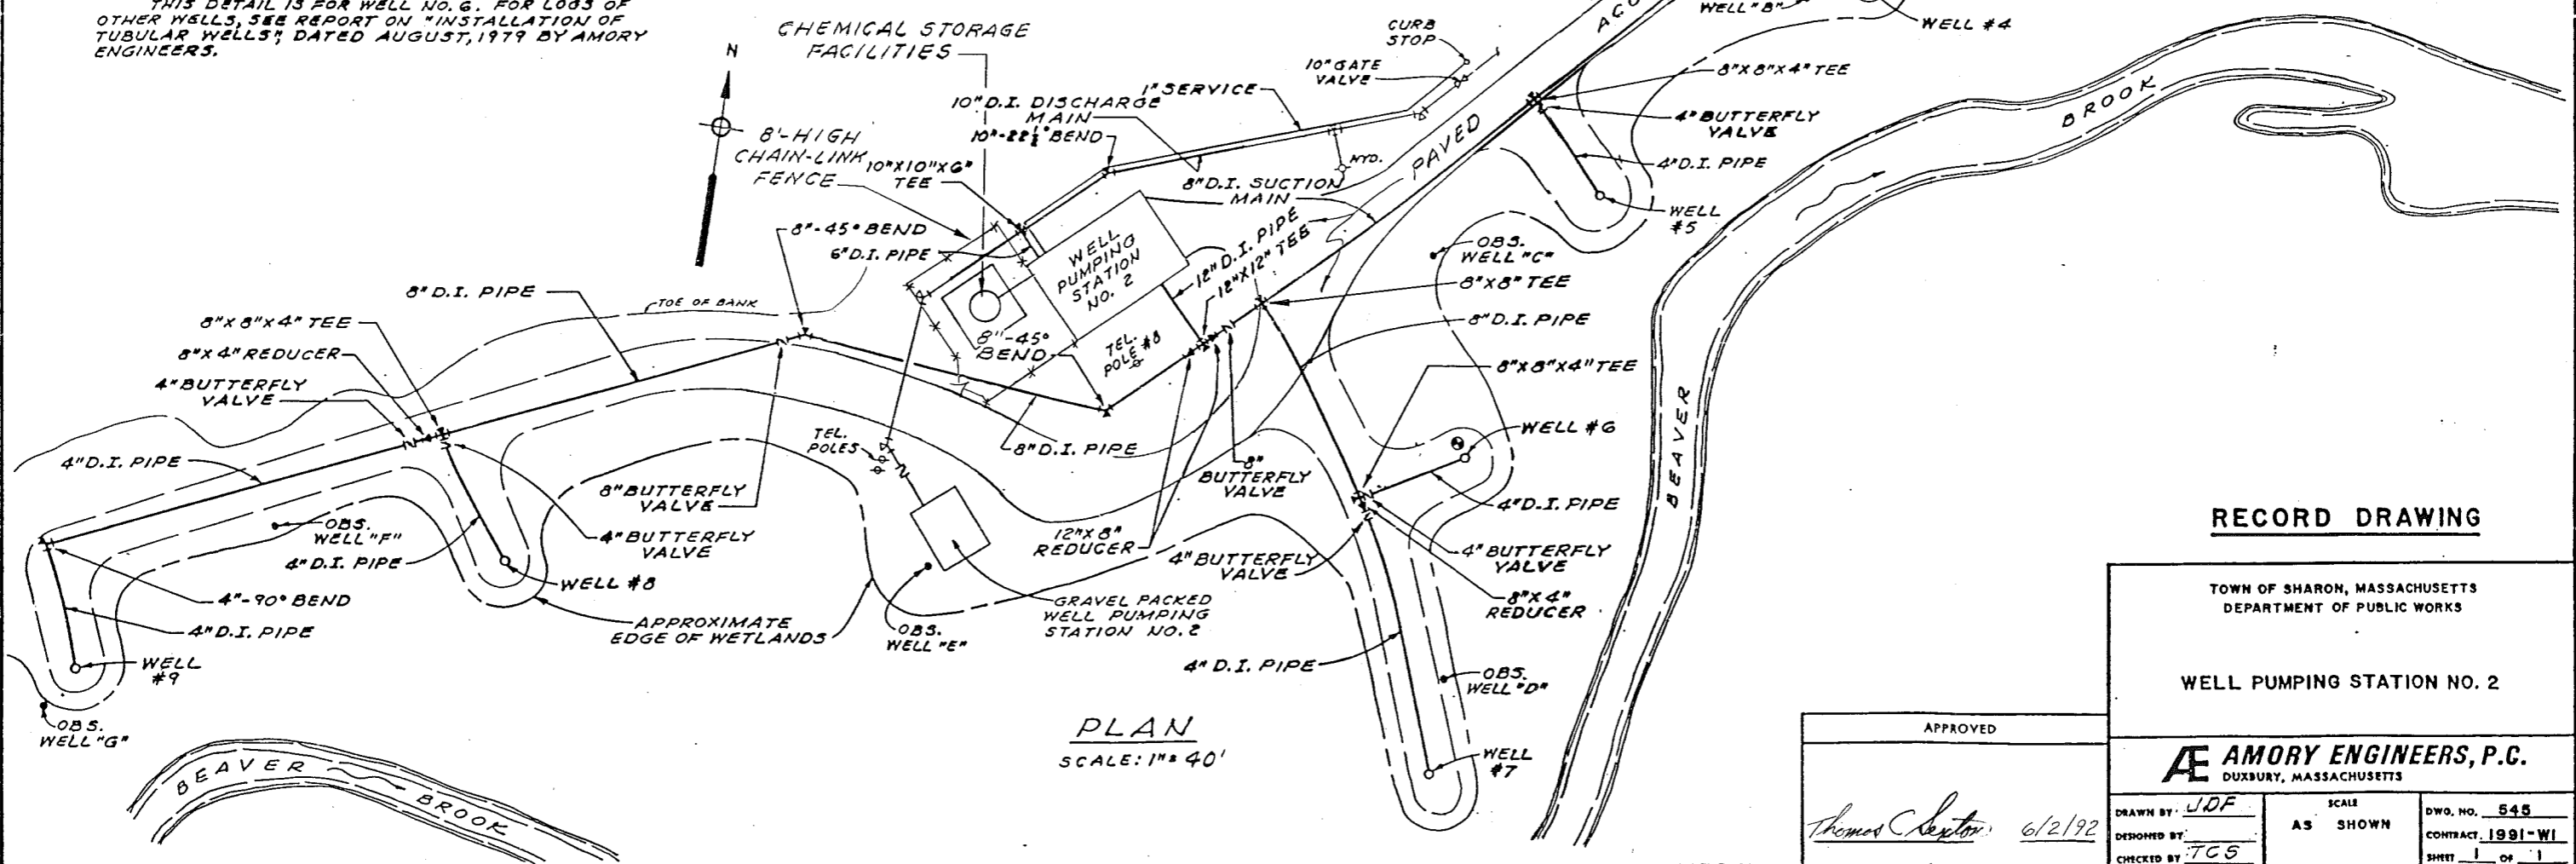

TYPICAL WELL CONSTRUCTION

NO SCALE

NOTE: THIS DETAIL IS FOR WELL NO. 6. FOR LOGS OF OTHER WELLS, SEE REPORT ON "INSTALLATION OF TUBULAR WELLS" DATED AUGUST, 1979 BY AMORY ENGINEERS.

**GENERAL NOTES**

1. TOPOGRAPHIC INFORMATION WAS TAKEN FROM A DRAWING PREPARED FOR THE TOWN OF SHARON ENGINEERING DEPARTMENT BY AVIS AIRMAP, INC.
2. ELEVATION DATUM IS U.S.G.S MEAN SEA LEVEL. A BENCH MARK WILL BE PROVIDED AT THE JOB SITE.
3. ABANDONED PIPING AND CONCRETE STRUCTURES ARE BURIED NEAR WELL PUMPING STATION NO. 2, PARTICULARLY TO THE EAST OF THE BUILDING. THE CONTRACTOR SHALL VERIFY WITH THE OWNER THAT A PIPE OR STRUCTURE UNCOVERED DURING CONSTRUCTION IS ABANDONED BEFORE REMOVAL.
4. ANY EXISTING PIPE OR STRUCTURE, PRESENTLY IN SERVICE, DAMAGED BY THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED IMMEDIATELY BY THE CONTRACTOR AT NO COST TO THE OWNER.
5. THE PROPOSED PIPELINE LOCATIONS ARE APPROXIMATE. FINAL LOCATIONS WILL BE DETERMINED AT THE TIME OF CONSTRUCTION.
6. FROM THE POINTS OF CONNECTION WITH EXISTING SUCTION MAINS, THE NEW SUCTION MAINS SHALL BE LEVEL OR RISING TOWARD THE STATION WITH NO INTERMEDIATE HIGH POINTS.
7. ALL UNDERGROUND FITTINGS, WHETHER ON SUCTION OR DISCHARGE MAINS SHALL BE BACKED WITH CONCRETE. WHERE ADEQUATE BACKING CANNOT BE ATTAINED, SUITABLE TIE RODS AND CLAMPS SHALL BE USED.
8. CARE SHALL BE TAKEN TO PREVENT DAMAGE TO TREES.
9. GRAVEL ACCESS ROADS, DISTURBED DURING CONSTRUCTION, SHALL BE RESTORED TO A CONDITION AT LEAST EQUAL TO THAT PRIOR TO THE START OF WORK.
10. THE CONTRACTOR'S ATTENTION IS DIRECTED TO APPENDIX A OF THE SPECIFICATIONS FOR TYPICAL DETAILS.
11. THE CONTRACTOR SHALL LOAM AND SEED ALL AREAS OUTSIDE THE GRAVEL ACCESS ROADS DISTURBED BY HIS OPERATIONS, EXCEPT THAT IN THE AREA OF THE DRY WELL THE SURFACE HUMUS AND PINE NEEDLE MULCH SHALL BE RESTORED.
12. THE CONCRETE FILL TO BE USED INSIDE THE STATION SHALL BE COLORED WITH PURE MINERAL OXIDE PIGMENT, FREE OF SOLUBLE SALTS AND ACIDS, FAST TO SUNLIGHT, RESISTANT TO ALKALIES AND WEAK ACIDS AND VIRTUALLY FREE OF CALCIUM SULFATE. THE FINISHED COLOR PRODUCED SHALL BE DEEP BRICK RED OR RED-BROWN. COLOR SAMPLES SHALL BE PROVIDED TO THE OWNER FOR SELECTION. THE PIGMENT SHALL BE ADDED TO THE CONCRETE MIX IN ACCORDANCE WITH THE MANUFACTURERS RECOMMENDATIONS.
13. THE CONTRACTOR'S ATTENTION IS CALLED TO THE FACT THAT GROUND-WATER MAY BE ENCOUNTERED DURING WATER MAIN INSTALLATION.

- ### GENERAL NOTES
- FILE ALL DOCUMENTS, PAY ALL PERMIT FEES, AND SECURE ALL INSPECTIONS AND APPROVALS NECESSARY FOR THE ELECTRICAL WORK.
  - ALL CONDUIT AND EQUIPMENT SHALL BE INSTALLED AND GROUNDED IN ACCORDANCE WITH THE LATEST EDITION OF THE NATIONAL ELECTRICAL CODE (NEC) AND APPLICABLE LOCAL CODES.
  - BONDING JUMPERS, CONDUIT CLAMPS AND POINTS OF ATTACHMENT ARE NOT SHOWN ON DRAWINGS. SIZE BONDING JUMPERS IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE. THE POINTS OF ATTACHMENT OF THE GROUND CLAMPS SHALL BE ACCESSIBLE LOCATIONS.
  - EQUIPMENT & CONDUIT INSTALLATIONS ARE SHOWN DIAGRAMMATICALLY ONLY AND SHALL BE INSTALLED IN A MANNER TO PREVENT CONFLICTS WITH EQUIPMENT AND STRUCTURAL CONDITIONS. EXPOSED CONDUITS SHALL BE INSTALLED PARALLEL TO BEAMS AND WALLS.
  - CONDUITS SHALL BE TERMINATED SO AS TO PERMIT NEAT CONNECTIONS TO MOTORS AND OTHER EQUIPMENT.
  - NO CONDUIT SMALLER THAN 3/4" PIPE SIZE NOR WIRE SMALLER THAN NO. 12 A.W.G. SHALL BE USED UNLESS OTHERWISE NOTED
  - BACK BOXES, JUNCTION BOXES, AND ELECTRICAL ENCLOSURES SHALL BE OF PRESSED SHEET STEEL, TYPE NEMA 3R FOR BUILDING EXTERIOR AND NEMA 1 FOR BUILDING INTERIOR.
  - EXTERIOR RACEWAY SHALL BE LIQUID TIGHT FLEXIBLE METAL CONDUIT, INTERIOR RACEWAY SHALL BE FLEXIBLE METAL CONDUIT. PROVIDE A COMPLETE CONDUIT SYSTEM INCLUDING ALL CONDUIT, CLAMPS, FITTINGS, MOUNTING EQUIPMENT, AND ECT.
  - PROVIDE ALL WIRE AND CABLE CONNECTIONS, TERMINATIONS AND SPLICES. WIRE TO BE 600V, COPPER, THWN. UTILIZE TWIST ON TYPE WIRE NUTS FOR SPLICES.
  - PROVIDE ALL CORES FOR CONDUITS AND MAKE WATERTIGHT WITH SEALANT AROUND CONDUIT.
  - ALL WORK SHOWN IS NEW (FURNISHED AND INSTALLED) UNLESS OTHERWISE NOTED.
  - ALL MATERIALS SHALL BE UL LISTED.

PIT	PRESSURE INDICATOR TRANSMITTER
PL	PUSHBUTTON CONTROL STATION MOMENTARY TYPE WITH LOCK-OUT DEVICE, STOP
PS	PRESSURE SWITCH
PT	PRESSURE TRANSMITTER
PV	PHOTOVOLTAIC
RGS	RIGID GALVANIZED STEEL
RVNR	REDUCED VOLTAGE NON-REVERSING
SPD	SURGE SUPPRESSOR DEVICE
SOV	SOLENOID VALVE
S/S	SOFT STARTER
TB	TERMINAL BOX
TD	MOTOR TEMPERATURE DETECTOR
TR	TIMING RELAY
TS	TEMPERATURE SWITCH
TSP	TWISTED SHIELDED PAIR
TSTW	TWO SPEED TWO WINDING
TYP	TYPICAL
UG	UNDERGROUND
UNO	UNLESS OTHERWISE NOTED
VFD	VARIABLE FREQUENCY DRIVE
WP	WATER PROOF
WHM	WATT HOUR UTILITY METER
XFMR	TRANSFORMER
ZS	POSITION SWITCH

### GENERAL NOTES

- ALL CONDUIT AND EQUIPMENT SHALL BE INSTALLED AND GROUNDED IN ACCORDANCE WITH THE LATEST EDITION OF THE NATIONAL ELECTRICAL CODE AND APPLICABLE LOCAL CODES.
- BONDING JUMPERS, CONDUIT CLAMPS AND POINTS OF ATTACHMENT ARE NOT SHOWN ON DRAWINGS. SIZE BONDING JUMPERS IN ACCORDANCE WITH THE NATIONAL ELECTRICAL CODE. THE POINTS OF ATTACHMENT OF THE GROUND CLAMPS SHALL BE ACCESSIBLE LOCATIONS.
- EQUIPMENT & CONDUIT INSTALLATIONS ARE SHOWN DIAGRAMMATICALLY ONLY AND SHALL BE INSTALLED IN A MANNER TO PREVENT CONFLICTS WITH EQUIPMENT AND STRUCTURAL CONDITIONS. EXPOSED CONDUITS SHALL BE INSTALLED PARALLEL TO BEAMS AND WALLS.
- CONDUITS SHALL BE TERMINATED SO AS TO PERMIT NEAT CONNECTIONS TO MOTORS AND OTHER EQUIPMENT.
- NO CONDUIT SMALLER THAN 3/4" PIPE SIZE NOR WIRE SMALLER THAN NO. 12 A.W.G. SHALL BE USED UNLESS OTHERWISE NOTED.
- RECEPTACLES AND SWITCHES SHALL BE MOUNTED 45" AFF EXCEPT FOR RECEPTACLES.
- THE WIRING AND BLOCK DIAGRAMS, QUANTITY AND SIZE OF WIRES AND CONDUIT REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL AND PROCESS EQUIPMENT. MODIFICATIONS ACCEPTABLE TO THE ENGINEER MAY BE MADE BY THE CONTRACTOR TO ACCOMMODATE EQUIPMENT ACTUALLY PURCHASED. THE BASIC SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND/OR SPECIFICATIONS.

### INSTRUMENTATION NOTES

- ALL INSTRUMENTS SHALL BE MOUNTED, PIPED, AND CONNECTED IN STRICT ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.
- WALL PENETRATIONS TO BE FRAMED AND SEALED PER BUILDING MANUFACTURER'S STANDARD DETAILS AND SPECIFICATIONS
- ELECTRICAL CONTRACTOR SHALL FURNISH AND INSTALL ALL NECESSARY POWER AND SIGNAL WIRING WITH CONDUITS SHOWN ON E-DRAWINGS, M-DRAWINGS, AND I-DRAWINGS BETWEEN POWER PANELS, PLC'S, CONTROL PANELS, AND FIELD INSTRUMENTS AS REQUIRED. REFER TO E-DRAWINGS.
- LOCATION OF PROCESS EQUIPMENT, MOTORS, VALVE, INSTRUMENTS, AND SIMILAR SHOWN ON THE DRAWINGS ARE APPROXIMATE. FINAL LOCATIONS TO BE DETERMINED IN FIELD TO MATCH EQUIPMENT.
- REFER TO POWER PLANS FOR INSTRUMENTATION POWER REQUIREMENTS.
- DURING ROUGH IN AND FINISHED STAGES OF CONSTRUCTION, THE GENERAL AND ELECTRICAL CONTRACTOR SHALL BE RESPONSIBLE TO PROTECT AND KEEP CLEAN ALL ELECTRICAL EQUIPMENT, PANELS, FIXTURES, AND DEVICES AS WELL AS ALL EXISTING EQUIPMENT AND RELATED WORK AREAS.
- THE CONTRACTOR SHALL PROVIDE ALL INFORMATION ABOUT EQUIPMENT WHICH THEY ARE FURNISHING TO THE ENGINEER/OWNER FOR REVIEW PURPOSES. THE CONTRACTOR SHALL PROVIDE ALL INSTRUMENTATION DETAILS AND SUPPORT COMPONENTS SO THAT THESE MAY BE BUILT INTO THE CONSTRUCTION IN A TIMELY MANNER.
- REFER TO E-DRAWINGS FOR ADDITIONAL DETAILS FOR CONDUIT, DEVICE LOCATIONS, AND POWER CIRCUITS.
- DRAWINGS SHOW A LAYOUT OF SCADA/INSTRUMENTATION SYSTEMS AND EQUIPMENT DIAGRAMMATICALLY. EXACT LOCATION OF EQUIPMENT AND ROUTING OF RACEWAYS SHALL BE DETERMINED BY FIELD CONDITIONS AND DIRECTION BY ENGINEER AND OWNER. BY SUBMITTING A BID, CONTRACTOR WARRANTS THAT HE/SHE HAS VISITED THE SITE WHERE WORK IS TO BE PERFORMED, AND HAS EXAMINED THE EXISTING CONDITIONS AND EXTENT OF LABOR AND MATERIALS TO BE PROVIDED. COORDINATION WITH ALL TRADES, UTILITIES, ETC. SHALL BE PROVIDED.
- CONTRACTOR SHALL REVIEW THE INSTRUMENTATION P&ID, SPECIFICATION SECTION 13465 - SEQUENCE OF OPERATIONS, I&C INPUTS/OUTPUTS, AND INSTRUMENTATION SCHEDULES IN A COMBINED MANNER FOR A COMPLETE PROCESS OVERVIEW.
- ELECTRICAL CONTRACTOR AND/OR SUBCONTRACTOR TO OBTAIN ALL PERMITS AND INSPECTIONS.

### DCAMM Updated Statement

**PRIME UPDATE STATEMENTS ARE NOT PUBLIC RECORDS AND  
ARE NOT OPEN TO PUBLIC INSPECTION (M.G.L. C.149, §44D)**

**TO ALL BIDDERS AND AWARDING AUTHORITIES**

A COMPLETED AND SIGNED PRIME CONTRACTOR UPDATE STATEMENT MUST BE SUBMITTED WITH EVERY PRIME BID FOR A CONTRACT PURSUANT TO M.G.L. c.149, §44A AND M.G.L. c. 149A. ANY PRIME BID SUBMITTED WITHOUT AN APPROPRIATE UPDATE STATEMENT IS INVALID AND MUST BE REJECTED.

***Caution: This form is to be used for submitting Prime Contract bids. It is not to be used for submitting Filed Sub-Bids or Trade Sub-Bids.***

**AWARDING AUTHORITIES**

**If the Awarding Authority determines that the bidder does not demonstrably possess the skill, ability and integrity necessary to perform the work on the project, it must reject the bid.**

---

**BIDDER'S AFFIDAVIT**

I swear under the pains and penalties of perjury that I am duly authorized by the bidder named below to sign and submit this Prime Contractor Update Statement on behalf of the bidder named below, that I have read this Prime Contractor Update Statement, and that all of the information provided by the bidder in this Prime Contractor Update Statement is true, accurate, and complete as of the bid date.

Bid Date	Print Name of Prime Contractor
Project Number (or name if no number)	Business Address
Awarding Authority	Telephone Number

**SIGNATURE⇒**

---

**Bidder's Authorized Representative**

**INSTRUCTIONS**

## **INSTRUCTIONS TO BIDDERS**

- This form must be completed and submitted by all Prime contractors bidding on projects pursuant to M.G.L. c. 149, §44A and M.G.L. c. 149A.
- You must give complete and accurate answers to all questions and provide all of the information requested. **MAKING A MATERIALLY FALSE STATEMENT IN THIS UPDATE STATEMENT IS GROUNDS FOR REJECTING YOUR BID AND FOR DEBARRING YOU FROM ALL PUBLIC CONTRACTING.**
- **This Update Statement must include all requested information that was not previously reported on the Application used for your firm's most recently issued (not extended or amended) Prime Contractor Certificate of Eligibility. The Update Statement must cover the entire period since the date of your Application, NOT since the date of your Certification.**
- You must use this official form of Update Statement. Copies of this form may be obtained from the awarding authority and from the Division of Capital Asset Management and Maintenance Web Site: [www.mass.gov/DCAMM](http://www.mass.gov/DCAMM).
- If additional space is needed, please copy the appropriate page of this Update Statement and attach it as an additional sheet.
- See the section entitled "Bidding Limits" in the *Instructions to Awarding Authorities* for important information concerning your bidding limits.

## **INSTRUCTIONS TO AWARDING AUTHORITIES**

### ***Determination of Bidder Qualifications***

- It is the awarding authority's responsibility to determine who is the lowest eligible and responsible bidder. You must consider all of the information in the low bidder's Update Statement in making this determination. **Remember:** this information was not available to the Division of Capital Asset Management and Maintenance at the time of certification.
- The bidder's performance on the projects listed in Parts 1 and 2 must be part of your review. Contact the project references.
- **AWARDING AUTHORITIES ARE STRONGLY ENCOURAGED TO REVIEW THE LOW BIDDER'S ENTIRE CERTIFICATION FILE AT THE DIVISION OF**

CAPITAL ASSET MANAGEMENT AND MAINTENANCE. Telephone (617) 727-9320 for an appointment.

### ***Bidding Limits***

**Single Project Limit:** The total amount of the bid, including all alternates, may not exceed the bidder's Single Project Limit.

**Aggregate Work Limit:** The annual value of the work to be performed on the contract for which the bid is submitted, when added to the annual cost to complete the bidder's other currently held contracts, may not exceed the bidder's Aggregate Work Limit. Use the following procedure to determine whether the low bidder is within its Aggregate Work Limit:

**Step 1** Review Update Statement Question #2 to make sure that all requested information is provided and that the bidder has accurately calculated and totaled the annualized value of all incomplete work on its currently held contracts (column 9).

**Step 2** Determine the annual dollar value of the work to be performed on your project. This is done as follows:

(i) If the project is to be completed in less than 12 months, the annual dollar value of the work is equal to the full amount of the bid.

(ii) If the project will take more than 12 months to complete, calculate the number of years given to complete the project by dividing the total number of months in the project schedule by 12 (calculate to 3 decimal places), then divide the amount of the bid by the calculated number of years to find the annual dollar value of the work.

**Step 3** Add the annualized value of all of the bidder's incomplete contract work (the total of column 9 on page 5) to the annual dollar value of the work to be

performed on your project. **The total may not exceed the bidder's Aggregate Work Limit.**

***Correction of Errors and Omissions in Update Statements***

Matters of Form: An awarding authority shall not reject a contractor's bid because there are mistakes or omissions of form in the Update Statement submitted with the bid, provided the contractor promptly

corrects those mistakes or omissions upon request of the awarding authority. [810 CMR 8.05(1)].

Correction of Other Defects: An awarding authority may, in its discretion, give a contractor notice of defects, other than mistakes or omissions of form, in the contractor's Update Statement, and an opportunity to correct such defects, provided the correction of such defects is not prejudicial to fair competition. An awarding authority may reject a corrected Update Statement if it contains unfavorable information about the contractor that was omitted from the Update Statement filed with the contractor's bid. [810 CMR 8.05(2)].

**PART 1 - COMPLETED PROJECTS**

LIST ALL PUBLIC AND PRIVATE *BUILDING* PROJECTS YOUR FIRM HAS COMPLETED SINCE THE DATE OF APPLICATION FOR YOUR MOST RECENTLY ISSUED (NOT EXTENDED OR AMENDED) DCAMM CERTIFICATE OF ELIGIBILITY. YOU MUST REPORT ALL REQUESTED INFORMATION NOT PREVIOUSLY REPORTED ON THAT DCAMM APPLICATION\*.

PROJECT TITLE & LOCATION	WORK CATEGORY	CONTRACT PRICE	START DATE	DATE COMPLETED

Attach additional sheets if necessary

\* If your firm has been terminated from a project prior to completion of the work or has failed or refused to complete its work under any contract, full details and an explanation must be provided. See Part 3 of this Update Statement.

PROVIDE THE FOLLOWING REFERENCE INFORMATION FOR EACH COMPLETED PROJECT LISTED ON THE PREVIOUS PAGE.

Is your company or any individual who owns, manages or controls your company affiliated with any owner, designer or general contractor named above either through a business or family relationship?  YES  NO

Are any of the contact persons named above affiliated with your company or any individual who owns, manages or control your company, either through a business or family relationship?  YES  NO

If you have answered YES to either question, explain. \_\_\_\_\_

For **Parts 3 and 4**, if you answer YES to any question, please provide on a separate page a complete explanation. You must report all requested information not previously reported on your most recent DCAMM Application for Prime Certificate of Eligibility. Information must supplement all judicial and administrative proceedings involving bidder's firm, which were instituted or concluded (adversely or otherwise) since your firm's Application for your most recently issued (not extended or amended) Certificate of Eligibility. Include all details [project name(s) and location(s), names of all parties involved, relevant dates, etc.].

**PART 3 – GENERAL PERFORMANCE**

Part 3 of the Update Statement corresponds to Section 5 of the Prime Application. The numbering below refers back to the numbered questions in the application for your reference.

**Prime Application Section 5 - General Performance**

	YES	NO
5.A. Has your Company been terminated prior to completion of a Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5.B. Has your Company failed or refused to perform or complete any of its Scope of Work under any Contract prior to substantial completion?	<input type="checkbox"/>	<input type="checkbox"/>
5.C. Has your Company and/or any principal, officer, or individual with a Financial Interest in your Company filed for bankruptcy?	<input type="checkbox"/>	<input type="checkbox"/>
5.D. Has a surety for your Company taken over or been asked to complete your Scope of Work under any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5.E. Has a payment or performance bond been invoked against your Company on any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5.F. Has any surety for your Company made payment under a payment bond to a vendor or supplier or other party on any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5.G. Has any subcontractor filed a demand for direct payment on any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5.H. Has a lawsuit been filed by any of your subcontractors or suppliers to enforce a mechanic's lien in connection with any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5.I. Has there been a death of any Company employee or other person in connection with (or as the result of) performing your Company's Scope of Work on any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5.J. Has any Company employee or other person suffered an injury while performing any tasks within the Scope of Work on any of your Contracts resulting in his/her inability to return to work for a period in excess of one year?	<input type="checkbox"/>	<input type="checkbox"/>

**PART 4 – LEGAL OR ADMINISTRATIVE PROCEEDINGS; COMPLIANCE WITH LAWS**

Part 4 of the Update Statement corresponds to section 6 of the Prime Application. The numbering below refers back to the numbered questions in the application for your reference.

**Prime Application Section 6 -Legal or Administrative Proceedings; Compliance with Laws**

The term “administrative proceeding” as used in this Prime Contractor Update Statement includes (i) any action taken or proceeding brought by a governmental agency, department or officer to enforce any law, regulation, code, legal, or contractual requirement, except for those brought in state or federal courts, or (ii) any action taken by a governmental agency, department or officer imposing penalties, fines or other sanctions for failure to comply with any such legal or contractual requirement.

The term “anyone with a financial interest in your firm” as used in this Section “I”, shall mean any person and/or entity with a 5% or greater ownership interest in the applicant’s firm.

	YES	NO
6.A. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to the procurement or performance of any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
6.B. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal construction procurement laws?	<input type="checkbox"/>	<input type="checkbox"/>
6.C. Have any criminal charges involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to the procurement or performance of any of your Contracts (e.g., fraud, graft, embezzlement, forgery, bribery, falsification or destruction of records or receipt of stolen property)?	<input type="checkbox"/>	<input type="checkbox"/>
6.D. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of state ethics laws (in Massachusetts: M.G.L. Chapter 268A)?	<input type="checkbox"/>	<input type="checkbox"/>

**Section 6 - Legal or Administrative Proceedings; Compliance with Laws (continued)**

	YES	NO
6.E. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal law regulating hours of labor, unemployment compensation, minimum wages, prevailing wages, overtime pay, equal pay, child labor or worker’s compensation?	<input type="checkbox"/>	<input type="checkbox"/>
6.F. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal law prohibiting discrimination in hiring and/or employment?	<input type="checkbox"/>	<input type="checkbox"/>
6.G. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled for violation of any state or federal law regulating labor relations, including collective bargaining agreements, employee welfare benefit plans, employee pension benefit plans, other ERISA and non-ERISA plans?	<input type="checkbox"/>	<input type="checkbox"/>
6.H. Have any proceedings by a local, state, or federal agency been brought, concluded, or settled relating to decertification, debarment or suspension of your Company and/or any principal or officer or individual with a Financial Interest in your Company from construction contracting?	<input type="checkbox"/>	<input type="checkbox"/>
6.I. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of state or federal environmental laws?	<input type="checkbox"/>	<input type="checkbox"/>
6.J. Has your Company been fined or sanctioned by OSHA and/or any other state or federal agency for violations of any laws or regulations related to occupational health or safety?	<input type="checkbox"/>	<input type="checkbox"/>
6.K. Has your Company ever (i) failed to meet applicable workforce and/or diversity program goals, benchmarks or other requirements, and/or (ii) been sanctioned, fined and/or penalized for non-compliance with workforce policies and/or diversity programs (e.g., for MBEs, WBEs, SDVOBEs and DBEs) and/or failure to maintain and/or submit required reports, such as certified payrolls.	<input type="checkbox"/>	<input type="checkbox"/>
6.L. Other than previously reported in the above questions, have any Judicial Actions or Administrative Proceedings or investigations involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled by any local, state or federal agency relating to the procurement or performance of any construction contract?	<input type="checkbox"/>	<input type="checkbox"/>

**PART 5 - SUPERVISORY PERSONNEL**

List all supervisory personnel, such as project managers and superintendents, who will be assigned to the project if your firm is awarded the contract. **Attach the resume of each person listed below.**

NAME	TITLE OR FUNCTION

**PART 6 - CHANGES IN BUSINESS ORGANIZATION OR FINANCIAL CONDITION**

Have there been any changes in your company’s business organization (**including changes in ownership, mergers, or asset/stock sales**), financial condition or bonding capacity since the date your current Certificate of Eligibility was issued?  Yes  No

**If YES, attach a separate page providing complete details.**

**PART 7 – LIST OF COMPLETED CONSTRUCTION PROJECTS SUBMITTED TO THE DIVISION OF CAPITAL ASSET MANAGEMENT AND MAINTENANCE.**

**Attach here a copy of the list of completed construction projects which was submitted with your firm’s DCAMM Application for your most recently issued (not extended or amended) DCAMM Certificate of Eligibility. The Attachment must include a complete copy of the entire Projects Table – “Completed Projects” and the final page – “Certification” (Signature Page) containing the signature and date that the Completed Projects list was submitted to the Division of Capital Asset Management and Maintenance.**

**SUB-BIDDERS' UPDATE STATEMENTS ARE NOT PUBLIC RECORDS AND  
ARE NOT OPEN TO PUBLIC INSPECTION (M.G.L. C.149, §44D)**

## Sub-Bidder Update Statement

### TO ALL SUB-BIDDERS, TRADE CONTRACTORS AND AWARDING AUTHORITIES

A COMPLETED AND SIGNED SUB-BIDDER UPDATE STATEMENT MUST BE SUBMITTED WITH EVERY FILED SUB-BID PURSUANT TO M.G.L. c.149, §44F AND EVERY TRADE SUB-BID PURSUANT TO M.G.L. c. 149A. ANY FILED SUB-BID OR TRADE SUB-BID SUBMITTED WITHOUT AN APPROPRIATE SUB-BIDDER UPDATE STATEMENT IS INVALID AND MUST BE REJECTED.

*Caution: This form is to be used for submitting Filed Sub-Bids and Trade Sub-Bids Only*

### AWARDING AUTHORITIES

If the Awarding Authority determines that the Sub-Bidder is not competent to perform the work as specified on the project, it should reject the bid.

---

### SUB-BIDDER'S AFFIDAVIT

I swear under the pains and penalties of perjury that I am duly authorized by the bidder named below to sign and submit this Sub-Bidder Update Statement on behalf of the bidder named below, that I have read this Sub-Bidder Update Statement, and that all of the information provided by the bidder in this Sub-Bidder Update Statement is true, accurate, and complete as of the bid date.

## INSTRUCTIONS

### INSTRUCTIONS TO SUB-BIDDERS

- This form must be completed and submitted by all Filed Sub-Bidders bidding on projects pursuant to M.G.L. c. 149, §44F and Trade Contractors bidding on projects pursuant to M.G.L. c. 149A.
- You must give complete and accurate answers to all questions and provide all of the information requested. **MAKING A MATERIALLY FALSE STATEMENT IN THIS SUB-BIDDER UPDATE STATEMENT IS GROUNDS FOR REJECTING YOUR BID AND FOR DEBARRING YOU FROM ALL PUBLIC CONTRACTING.**
- **This Sub-Bidder Update Statement must include all requested information that was not previously reported on the Application used for your company's most recently issued (not extended or amended) Sub-Bidder Certificate of Eligibility. The Sub-Bidder Update Statement must cover the entire period since the date of that Application, NOT since the date of your Certification.**
- You must use this official form of Sub-Bidder Update Statement. Copies of this form may be obtained from the awarding authority or from the DCAMM Web Site:  
[www.mass.gov/DCAMM/certification](http://www.mass.gov/DCAMM/certification).
- If additional space is needed, please copy the appropriate page of this Sub-Bidder Update Statement and attach it as an additional sheet.

### INSTRUCTIONS TO AWARDING AUTHORITIES

#### ***Determination of Sub-Bidder Qualifications***

- It is the awarding authority's responsibility to determine each responsible bidder. You must consider all of the information in the bidder's Sub-Bidder Update Statement in making this determination. Remember: this information was not available to the Division of Capital Asset Management and Maintenance at the time of certification.
- The Sub-Bidder's performance on the projects listed in Parts 1 and 2 must be part of your review. Contact the project references.
- Awarding Authorities are strongly encouraged to review the Sub-Bidder's entire certification file at the Division of Capital Asset Management and Maintenance, telephone (857) 204-1305 or via email at [certification.DCAMM@mass.gov](mailto:certification.DCAMM@mass.gov) for an appointment.

#### ***Correction of Errors and Omissions in Sub-Bidder Update Statements***

Matters of Form: An awarding authority shall not reject a Sub-Bidder's bid because there are mistakes or omissions of form in the Sub-Bidder Update Statement submitted with the bid pursuant to M.G.L. c.149, §44D, provided the Sub-Bidder promptly corrects those mistakes or omissions upon request of the awarding authority. [810 CMR 8.13(1)]

Correction of Other Defects: An awarding authority may, in its discretion, give a Sub-Bidder notice of minor defects and omissions as to form in the Sub-Bidder's Update Statement and provide an opportunity to correct its Sub-Bidder Update Statement. However, the Sub-Bidder shall not be allowed to make corrections to a Sub-Bidder Update Statement if material information about the Sub-Bidder was omitted from the Sub-Bidder Update Statement filed with the Sub-Bidder's bid. The Awarding Authority shall advise DCAMM of any material omissions in a Sub-Bidder's Update Statement. [810 CMR 8.13(2)]

**PART 1 - COMPLETED PROJECTS**

List All Public And Private Projects Of \$20,000 or more your company has completed since the date of application for your most recently issued (not extended or amended) Sub-Bidder Certificate Of Eligibility\*.

PROJECT TITLE & LOCATION	WORK CATEGORY	CONTRACT PRICE	START DATE	DATE COMPLETED

Attach additional sheets if necessary

\* If your company has been terminated from a project prior to completion of the work or has failed or refused to complete its work under any contract, full details and an explanation must be provided. See Part 3 of this Sub-Bidder Update Statement.

PROVIDE THE FOLLOWING REFERENCE INFORMATION FOR EACH COMPLETED PROJECT LISTED ON THE PREVIOUS PAGE.

PROJECT TITLE		COMPANY NAME	CONTACT PERSON	TELEPHONE	EMAIL ADDRESS

Are any of the contact persons named above affiliated with your company or any individual who owns, manages or control your company, either through a business or family relationship?  YES  NO

If you have answered YES to either question, explain. \_\_\_\_\_

**PART 3 - GENERAL PERFORMANCE**

**For Parts 3 and 4, if you answer YES to any question, please provide on a separate page a complete explanation. Information you provide herein must supplement the application for your most recently issued (not extended or amended) Sub-Bidder Certificate of Eligibility. You must report all requested information not previously reported on that application.**

Include all details [project name(s) and location(s), names of all parties involved, relevant dates, etc.].

	YES	NO
5A. Has your Company been terminated prior to completion of a Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5B. Has your Company failed or refused to perform or complete any of its Scope of Work under any Contract prior to substantial completion?	<input type="checkbox"/>	<input type="checkbox"/>
5C. Has your Company and/or any principal, officer, or individual with a Financial Interest in your Company filed for bankruptcy?	<input type="checkbox"/>	<input type="checkbox"/>
5D. Has a surety for your Company taken over or been asked to complete your Scope of Work under any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5E. Has a payment or performance bond been invoked against your Company on any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5F. Has any surety for your Company made payment under a payment bond to a vendor or supplier or other party on any Contract?	<input type="checkbox"/>	<input type="checkbox"/>
5G. Has any subcontractor filed a demand for direct payment on any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5H. Has a lawsuit been filed by any of your subcontractors or suppliers to enforce a mechanic's lien in connection with any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5I. Has there been a death of any Company employee or other person in connection with (or as the result of) performing your Company's Scope of Work on any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
5J. Has any Company employee or other person suffered an injury while performing any tasks within the Scope of Work on any of your Contracts resulting in his/her inability to return to work for a period in excess of one year?	<input type="checkbox"/>	<input type="checkbox"/>

**PART 4 - Legal or Administrative Proceedings; Compliance with Laws**

**Please answer the following questions. Information must supplement all judicial and administrative proceedings involving bidder’s company, which were instituted or concluded (adversely or otherwise) since your company’s Application for your most recently issued (not extended or amended) Sub-Bidder Certificate of Eligibility. You must report all requested information not previously reported on that DCAMM Application.**

The term “administrative proceeding” as used in this Sub-Bidder Update Statement includes (i) any action taken or proceeding brought by a governmental agency, department or officer to enforce any law, regulation, code, legal, or contractual requirement, except for those brought in state or federal courts, or (ii) any action taken by a governmental agency, department or officer imposing penalties, fines or other sanctions for failure to comply with any such legal or contractual requirement.

The term “anyone with a financial interest in your company” as used in this Section “1”, shall mean any person and/or entity with a 5% or greater ownership interest in the applicant’s company.

**If you answer YES to any question, on a separate page provide a complete explanation of each proceeding or action and any judgment, decision, fine or other sanction or result. Include all details (name of court or administrative agency, title of case or proceeding, case number, date action was commenced, date judgment or decision was entered, fines or penalties imposed, etc.).**

	YES	NO
6.A. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to the procurement or performance of any of your Contracts?	<input type="checkbox"/>	<input type="checkbox"/>
6.B. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal construction procurement laws?	<input type="checkbox"/>	<input type="checkbox"/>
6.C. Have any criminal charges involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to the procurement or performance of any of your Contracts (e.g., fraud, graft, embezzlement, forgery, bribery, falsification or destruction of records or receipt of stolen property)?	<input type="checkbox"/>	<input type="checkbox"/>
6.D. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of state ethics laws (in Massachusetts: M.G.L. Chapter 268A)?	<input type="checkbox"/>	<input type="checkbox"/>

**PART 4 - Legal or Administrative Proceedings; Compliance with Laws (continued)**

	YES	NO
6.E. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal law regulating hours of labor, unemployment compensation, minimum wages, prevailing wages, overtime pay, equal pay, child labor or worker’s compensation?	<input type="checkbox"/>	<input type="checkbox"/>
6.F. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of any state or federal law prohibiting discrimination in hiring and/or employment?	<input type="checkbox"/>	<input type="checkbox"/>
6.G. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled for violation of any state or federal law regulating labor relations, including collective bargaining agreements, employee welfare benefit plans, employee pension benefit plans, other ERISA and non-ERISA plans?	<input type="checkbox"/>	<input type="checkbox"/>
6.H. Have any proceedings by a local, state, or federal agency been brought, concluded, or settled relating to decertification, debarment or suspension of your Company and/or any principal or officer or individual with a Financial Interest in your Company from construction contracting?	<input type="checkbox"/>	<input type="checkbox"/>
6.I. Have any Judicial Actions or Administrative Proceedings involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled relating to a violation of state or federal environmental laws?	<input type="checkbox"/>	<input type="checkbox"/>
6.J. Has your Company been fined or sanctioned by OSHA and/or any other state or federal agency for violations of any laws or regulations related to occupational health or safety?	<input type="checkbox"/>	<input type="checkbox"/>
6.K. Has your Company ever (i) failed to meet applicable workforce and/or diversity program goals, benchmarks or other requirements, and/or (ii) been sanctioned, fined and/or penalized for non-compliance with workforce policies and/or diversity programs (e.g., for MBEs, WBEs, SDVOBEs and DBEs) and/or failure to maintain and/or submit required reports, such as certified payrolls.	<input type="checkbox"/>	<input type="checkbox"/>
6.L. Other than previously reported in the above questions, have any Judicial Actions or Administrative Proceedings or investigations involving your Company and/or a principal or officer or individual with a Financial Interest in your Company been brought, concluded, or settled by any local, state or federal agency relating to the procurement or performance of any construction contract?	<input type="checkbox"/>	<input type="checkbox"/>

**PART 5 - SUPERVISORY PERSONNEL**

List all supervisory personnel who will be assigned to the project if your company is awarded the contract.

**Attach the resume of each person listed below.**

NAME	TITLE OR FUNCTION

**PART 6 - CHANGES IN BUSINESS ORGANIZATION OR FINANCIAL CONDITION**

Have there been any changes in your company’s business organization (**including changes in ownership, mergers, or asset/stock sales**), financial condition or bonding capacity since the date your current Certificate of Eligibility was issued?  Yes  No

**If YES, attach a separate page providing complete details.**

**PART 7 – LIST OF COMPLETED CONSTRUCTION PROJECTS SUBMITTED TO THE DIVISION OF CAPITAL ASSET MANAGEMENT AND MAINTENANCE ALONG WITH CERTIFICATION SIGNATURE PAGE.**

Attach here a copy of the list of completed construction projects which was submitted with your company’s application for your most recently issued (not extended or amended) Sub-Bidder Certificate of Eligibility. The Attachment must include a complete copy of the entire Completed Projects spreadsheet and the final page Certification (Signature) Page of the online application, containing the signature and date the completed projects list was submitted to the Division of Capital Asset Management and Maintenance.

July 15, 1998

John A. Sulik, P.E., Superintendent  
Department of Public Works  
P. O. Box 517  
Sharon, MA 02067-0517

Subject: **Redevelopment of Well No. 2 Wellfield**

Dear Mr. Sulik:

In accordance with our proposal of September 26, 1997, we submit this letter report on results of redevelopment of the nine wells in the Station No. 2 Wellfield. The purpose of well redevelopment was to restore deteriorated well capacity to the 1992 level, the year the wells were last cleaned.

**Well Redevelopment**

Bids for redevelopment of the wells were received on February 4, 1998, and the work awarded to F.G. Sullivan Drilling Company, the low bidder. Bids included two alternative methods of redevelopment, conventional and a new process called Aqua Freed. Because the cost of the Aqua Freed alternative was the lower of the two, the Contractor was directed to proceed with this method of redevelopment.

The Aqua Freed method employs carbon dioxide injection under pressure into each well. After a contact period of 16 hours or more, the wells are then surged and water pumped to waste until the wells pump freely. The carbon dioxide acidifies the water, which dissolves iron and manganese around the well and opens passageways for water to flow to the wells more freely.

Work began on May 22. All nine wells were pumped individually in order to determine specific capacity before redevelopment. Results are presented in Table 1. The before-cleaning specific capacity results, along with specific capacities after the most recent prior cleaning in 1992, were used to evaluate the effectiveness of cleaning under this contract.

**TABLE 1. RESULTS OF REDEVELOPMENT**

Well	1992 <sup>2</sup>	Specific Capacity - gpm/ft.		Regained Specific Capacity <sup>1</sup>
		Before Cleaning	After Cleaning	
1	11.5	15.3	15.2	132
2	12.2	0.9	10.7	88
3	10.2	8.5	9.4	92
4	6.8	0.6	5.1	75
5	18.8	1.1	17.8	95
6	10.2	0.6	9.5	93
7	19.8	1.2	18.0	91
8	10.3	0.5	10.3	100
9	10.9	1.1	10.9	100

Work under the contract was completed on June 19.

### Results

Results show that eight of the nine wells recovered approximately 90 percent or more of the 1992 target specific capacities. Only Well 4 failed to approach the target. However, this well has

<sup>1</sup> As percent of 1992 specific capacities.

<sup>2</sup> Date of most recent prior redevelopment. Results shown are specific capacities after cleaning.

always been the least productive well in the wellfield. The failure of Well 4 to return to 1992 capacity should not affect total wellfield production.

In the process of the work, Well 8 was found to have a broken saddle at the connection between well casing and discharge main. This condition can allow entrance of surface water contaminants, such as sediment and bacteria, into the water system. Well 8 must be shut off until the saddle is repaired.

Upon completion of redevelopment, the nine wells were disinfected in preparation for returning the wells to service. Samples taken after disinfection showed absence of coliform bacteria in Wells 1, 2, 3, 4, 5 and 9 but the presence of coliform bacteria in Wells 6, 7 and 8. Wells 6 and 7 should be rechlorinated before use and Well 8 disinfected after repairs are complete. Laboratory analyses for bacteria are included in Appendix B. As a continuing routine, we recommend that monthly samples be taken from the raw water pumped from the wellfield to monitor bacterial quality.

In addition to bacteria analyses, water samples were also tested for secondary contaminants (see Appendix B). Samples were taken from all nine wells plus the adjacent stream (Beaver Brook). Well sample results were compared with the stream sample to evaluate whether a possible direct connection exists between surface water and the wells. This precaution was taken to assess the concern that cleaning might have created an interconnection between surface water and the wells.<sup>1</sup> Review of the results of secondary contaminant analyses indicates no apparent interconnection.

Secondary contaminant results also indicate the presence of high concentrations of iron and manganese. From past experience it appears that elevated concentrations of these contaminants is

---

<sup>1</sup> Cleaning by the Aqua Freed process reportedly extends much further into the aquifer around the wells than conventional cleaning, giving opportunity for opening a direct connection between surface and groundwater.

a common result of redevelopment by the Aqua Freed process. But the concentrations typically decrease over a short period of pumping. We expect this pattern of decreasing concentrations will be evident at Well 2. We recommend monitoring iron and manganese from this source on a routine basis.

**Conclusions and Recommendations**

We offer the following conclusions and recommendations:

1. The Aqua Freed redevelopment process restored overall specific capacity to within 3.5 percent of 1992 levels.
2. Well 8 must not be used until the broken saddle connection is repaired.
3. Wells 6 and 7 should be disinfected again before being pumped to the system.
4. Raw water samples should be obtained from the wellfield monthly and tested for bacteria.
5. Analyses for iron and manganese should be performed on this source on a regular basis.
6. Suction pressures and pumping water levels in the wells should be monitored at regular intervals to assess when redevelopment should next be required.

Please call if you have any question.

Very truly yours,

AMORY ENGINEERS, P.C.

\* The maximum contaminant level (MCL) as adopted by the Commonwealth of Massachusetts in drinking water is absent (based on the presence/absence of total coliform).

\*\* Currently there are no limits (recommended or mandated) for this parameter. The Department of Public Health guideline is <500 per mL (this is merely presented for guidance).

Bacteriologically, this water meets the Maximum Contaminant Level requirement as established by the Commonwealth of Massachusetts for drinking water.

Analytical method:

Coliform count: Standard Methods 9222B - 18<sup>th</sup> ed.

Heterotrophic plate count: Standard Methods 9215B - 18<sup>th</sup> ed.

Superintendent  
Department of Public Works  
P. O. Box 517  
Sharon, MA 02067-0517

Re: Redevelopment of Pumping Station No. 2 Wellfield  
and Appurtenant Work, Contract 1991-W1

Dear Mr. Sulik:

This letter is to advise you of the results of redevelopment of Pumping Station No. 2 Wellfield. This project was recommended as part of the Phase 1 Construction Program in the Water Master Plan Update. Bids for Contract 1991-W1 were opened on December 18, 1991. The Contract was executed with F. G. Sullivan Drilling Company of Lancaster, MA on February 28, 1992. The work began on March 5, 1992 and was completed on April 7, 1992.

Well Redevelopment. The first phase of the work consisted of redevelopment of the nine 8-in. production wells by pumping and surging with and without chemicals. Well locations are shown on Appendix Figure A-1. Chemicals used for redevelopment included muriatic acid, hexametaphosphate and calcium hypochlorite.

Mr. John A. Sulik, P.E.  
June 24, 1992  
Page 2

Specific capacities of the wells were measured prior to, during and upon completion of well redevelopment. Specific capacities prior to and upon completion of redevelopment are summarized in Table 1 and presented in the driller's logs in Appendix A. Original specific capacities when the wells were new are also presented in Table 1 for comparison. Results show that specific capacities recovered to between 72 and 130 percent of original.

Upon completion of well redevelopment, the tops of the wells were fitted with 1-in. drop pipes and vacuum gauges for monitoring water levels. Protective steel caps were installed over the tops of the wells.

Water Quality. Water samples were taken from each of the wells after redevelopment and analyzed by Reitzel Laboratories, Clinton, MA. Results indicate that iron and manganese concentrations are acceptable in about half of the wells and excessive in the other half. For aesthetic purposes, the recommended limits for iron and manganese are 0.30 mg/l and 0.05 mg/l, respectively. Iron levels ranged from less than 0.05 mg/l (Wells 3 and 4) to 4.20 mg/l (Well 1). Manganese levels ranged from 0.02 mg/l (Wells 7) to 1.10 mg/l (Well 1). Combined iron and manganese levels were highest in Wells 1, 6 and 8 at 5.3, 2.6 and 2.5 mg/l,

\* - SULFIDE

\*\* - NONE DETECTED

Mr. John A. Sulik, P.E.  
June 24, 1992  
Page 4

respectively. A composite sample from all nine wells, analyzed by Oliveira Laboratories, West Bridgewater, MA, showed a iron level of 1.79 mg/l and manganese level of 0.30 mg/l, both in excess of recommended limits.

Turbidity was detected in all samples, ranging from 0.5 NTU (Well 3) to 35 NTU (Well 6) in the individual samples, and 7.2 NTU in the composite sample. While there is no MCL maximum contaminant levels for turbidity of groundwater, turbidity of 1.0 NTU or less is a desirable performance standard.

Nitrate levels were highest in Wells 1, 3, 6 and 7, ranging from 3.5 to 4.1 mg/l. Nitrate levels in other wells and in the composite sample were 2.3 mg/l or less. The MCL for nitrate is 10 mg/l.

Results of water quality analyses are summarized in Table 2 and presented in Appendix B.

Pump and Piping Tests. The second phase of the work included investigation of wellfield suction piping for leaks and wellfield pumping units for acceptable performance. During redevelopment, a leak was found in the piping connection to Well 8 and repaired by Water Division personnel. Subsequent to repair, the wellfield suction piping between individual well isolation valves and the

Mr. John A. Sulik, P.E.  
June 24, 1992  
Page 5

pumps was subjected to a vacuum test. Results showed no leakage.

On May 14, 1992, pump performance tests were performed on the station's two horizontal turbine pumps, the wellfield pumping units. The results, presented in Table 3 and in Figure 1 for Pump A and Table 4 and Figure 2 for Pump B, show that each pump is operating below original capacity. We believe the reduced performance is the result of normal pump wear for twelve-year-old pumps.

Conclusions and Recommendations. Wellfield water levels should be recorded monthly or more frequently, depending on use. Specific capacity of individual wells should be evaluated annually to determine their rates of decline and timing of future redevelopment.

Iron and manganese have been and continue to be problematic at Station 2. Water quality will continue to cause consumer complaints unless the supply is treated or operated selectively. Until treatment is provided, we recommend that the Water Division operate Station 2 in lag position after other better-water-quality wells, and only as water system demands require. To reduce composite iron and manganese concentrations, we recommend that one or more

of the individual wells with poorer water quality (i.e., Wells No. 1, 6 and 8), be shut off. Composite sampling should be repeated after each well is shut off, to assess improvement in water quality.

Since pump performances have not declined excessively, we recommended against pump replacement at this time. Pump performance should be evaluated annually.

Very truly yours,

AMORY ENGINEERS, P.C.

GRAVEL WELLS - TEST BORINGS - WELL RECONDITIONING • ANYWHERE IN NEW ENGLAND

PARKER ROAD • LANCASTER, MASS. 01523  
TELEPHONE 617-365-2932

Town of Sharon, MA  
Well Redevelopment Pump Sta. #2  
8" Gravel Well #1

4/17/92 - Set up the rig and installed 42' of 4" surge pipe, with an 8" surge set 1 ft. above the top of the screen and test pumped the well.

GPM - 50 with drawdown to 26.30' (2.2 GPF)  
Static from top of pipe - 3.60 A.G. - 0.70  
Depth from top of pipe - 41.70 Top of screen - 35.60 from top of pipe  
Screen length - 5'

The well was then pumped and surged for 7 hrs. The well then pumped 75 GPM with drawdown to 26.20 (3.3 GPF)  
Hrs - 8

4/21/92 - Pumped into the well 55 gals. of Muratic Acid with 1 pt. of Rodine 308, by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it, chased by 25 gals. of water. The well was then surged without pumping for 5 mins. every 15 mins. for 5½ hrs. We then pumped and surged the well for 1 hr. the well then pumped 100 GPM with drawdown to 25.00 (4.7 GPF). The acid was pumped into a settling tank where it was neutralized with 100 lbs. of light soda ash.

A mixture of 100 lbs. of Hexametaphosphate with 300 gals of water was pumped into the well by way of the 4" surge pipe raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 50 gals of water. The well was then surged without pumping for 5 mins. every 15 mins. for 1½ hrs. A mixture of 20 lbs. of calcium hypochlorite and 250 gals. of water was pumped into the well, by way of the 4" surge pipe raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 30 gals. of water. The well was then surged without pumping for 5 mins. every 15 mins. for 1½ hrs. and left overnight.

Hrs. - 10

4/22/92 - Surged the well without pumping for 5 mins. every 15 mins. for 3 hrs. Then pumped and surged the well for 5 hrs. the well then pumped 172 GPM with drawdown to 19.70 (10.7 GPF).

Hrs. - 8

Town of Sharon, MA  
Well Redevelopment Pump Sta. #2  
8" Gravel Well #1  
Page 2

4/23/92 - Surged and pumped the well for 7 hrs. the well then pumped 180 GPM with drawdown to 19.20 (11.5 GPF).

Depth after cleaning - 41.7 from top of pipe

The 4" surge pipe was pulled from the well. The rig was taken down and returned to Lancaster, MA

8" Gravel Well #6

3/20/92 - Set up the rig on the well and installed 33' of 4" surge pipe with an 8" surge set 1 ft. above the top of the screen. The well was then test pumped.

GPM - 50 with drawdown to 26.0' (2.1 GPF)  
Static from top of pipe - 2.40 A.G. - 1.00  
Depth from top of pipe - 32.7  
Top of screen - 26.2 from top of pipe  
Screen length - 5'

The screen was full of rusty material and some sand that had to be sand pumped out.

The well was pumped and surged for 5 hrs. The well then pumped 80 GPM with drawdown to 21.6 (4.1 GPF).

Hrs. - 8

3/23/92 - Pumped into the well 55 gals. of Muratic Acid with 1 pt. Rodine 308 by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 30 gals. of water. The well was then surged without pumping for 5 hrs. We then pumped and surged the well for 2 hrs. The well then pumped 120 GPM with drawdown to 22.00' (6.1 GPF). The acid was pumped into a settling tank where it was neutralized with 100 lbs. of light soda ash. Then we pumped into the well a mixture of 100 lbs. of hexametaphosphate with 300 gals of water by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 75 gals. of water. The well was then surged without pumping for 5 mins. every 15 mins. for 1½ hrs. We then pumped into the well a mixture of 25 lbs. of Calcium Hypochlorite with 300 gals. of water by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 100 gals. of water. The well was then surged without pumping for 5 mins. every 15 mins for 1 hr. and left overnight.

Hrs. - 9½

3/24/92 - Surged the well without pumping for 5 mins. every 15 mins. for 1½ hrs. The well was then pumped and surged for 7 hrs. The well then pumped 190 GPM with drawdown to 21.00 (10.2 GPF).

Hrs. - 8½

GRAVEL WELLS - TEST BORINGS - WELL RECONDITIONING • ANYWHERE IN NEW ENGLAND

PARKER ROAD • LANCASTER, MASS. 01523

TELEPHONE 617-365-2932

Town of Sharon, MA  
Well Redevelopment Pump Sta. #2  
8" Gravel Well #9

3/4/92 - Mobilized the rig from Lancaster, MA to Sharon Well #9 and set it up. Installed 35' of 4" surge pipe and 8" surge. Hay bails were laid out around well site.

Hrs. - 3      Travel - 1

3/5/92 - We test pumped the well. It pumped 50 GPM with drawdown to 24.50 (2.4 GPF). We pumped and surged the well for 5 hrs. The well then pumped 120 GPM with drawdown to 18.9' (8.1 GPF).

Static top of pipe - 4.10      A.G. 1.50  
Depth top of pipe - 34.4  
Top of screen top of pipe - 28.9  
GPM - 50 with drawdown to 24.50 (2.4 GPF)

Hrs. - 6

3/6/92 - Pumped into the well by way of the 4" surge pipe, 55 gals. of Muratic Acid and 1 pt. Rodine 308, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 25 gals. of water. The well was then surged without pumping for 6 hrs. The well was then pumped and surged for 2 hrs. The well then pumped 125 GPM with drawdown to 19.00 (8.3 GPF). The acid was pumped into a settling tank where it was neutralized with 200 lbs. of light sida ash.

Hrs. - 8

3/9/92 - Surged and pumped the well for 3½ hrs. We then pumped into the well a mixture of 100 lbs. of Hexametaphosphate with 300 gals. of water by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 100 gals. of water. We then surged the well without pumping for 5 mins. every 15 mins. for 2 hrs. Then we pumped into the well a mixture of 20 lbs. of Calcium Hypochlorite and 300 gals. of water by way of the 4" surge pipe, raising and lowering it the length of the screen (5') so to evenly distribute it. Chased by 100 gals. of water. We then surged the well without pumping for 5 mins. every 15 mins. for 2 hrs. and left overnight.

Hrs. - 8

Town of Sharon, MA  
Well Redevelopment Pump Sta. #2  
8" Gravel Well #9  
Page 2

3/10/92 - Pumped and surged the well for 8 hrs. The well then pumped 136 GPM with drawdown to 16.6' (10.8 GPF). We pulled the 4" surge pipe from the well and moved the rig to well #8.

Depth - top of pipe - 34.40 after cleaning

Hrs. - 8

Total Hrs. - 33      1Hr. Travel

Template B: Post-Abatement Visual Inspection Documentation .....	20

## **I. Background**

The Massachusetts Department of Environmental Protection's (MassDEP's) asbestos regulation (310 CMR 7.15) protects public health and the environment by establishing safe handling practices for demolishing or renovating buildings and structures to prevent the release of asbestos fibers from asbestos-containing materials (ACM). MassDEP's regulations require notification as well as specific removal, handling, and disposal requirements for all ACM. These work practices include removing ACM prior to demolition or renovation activities, wetting the ACM before it is removed to prevent the release of asbestos dust, fully containing the work area (e.g., with plastic sheeting) and drawing air out of the containment through an air filtration unit equipped with a HEPA filter capable of capturing asbestos fibers, sealing the wetted Asbestos-Containing Waste Material (ACWM) in leak-tight containers with asbestos labeling, and properly disposing of the waste in a landfill permitted to accept ACM or ACWM.

Asbestos cement pipes often are found in underground utility conduits and municipal water, sewer and drainage systems. Asbestos cement pipes buried below ground are considered non-friable if they are in good condition. It should be noted that active asbestos cement pipe that is exposed and is not intended to be replaced or removed and is not disturbed by repair or replacement activities may remain in place and be backfilled.

## **II. Purpose**

This guidance document is based on the requirements in 310 CMR 7.15(12A) and explains how to safely remove, repair and dispose of asbestos cement pipes that are repaired or replaced in underground system networks owned by public and private utilities (e.g. water, sewer, electricity and gas). Its main purpose is to prevent the release of asbestos fibers into ambient air and to protect public health, safety, and the environment while removing, repairing and disposing of asbestos cement pipes.

This guidance document summarizes the requirements for underground asbestos-cement pipe that is owned by public and private utilities (e.g., pipes conveying drinking water, sanitary sewage, storm water, electricity, and gas).

This guidance document and 310 CMR 7.15(12A) only applies to asbestos-cement pipe. If at any time the owner or operator determines that the pipe they are repairing or replacing is not asbestos-cement pipe, they must comply with the applicable requirements of 310 CMR 7.15.

This document does not constitute "final agency action," and is not "regulation" as that term is used in M.G.L. c.30A. It may not be relied upon to create rights, duties, obligations or defenses, implied or otherwise, enforceable by any party in any administrative proceeding with the Commonwealth. In addition, this guidance does not exempt anyone from complying with any other applicable local, state or federal law,

including but not limited to: the United States Environmental Protection Agency (EPA) Asbestos National Emission Standards for Hazardous Air Pollutants (Asbestos NESHAP) regulation at 40 CFR part 61; the applicable United States Occupational Safety & Health Act (OSHA) standards at 29 CFR 1910 & 1926; and the Massachusetts Department of Labor Standards (DLS) regulation at 453 CMR 6.00.

### **III. Guidance Provisions**

#### ***a. Pre-Demolition/Renovation Survey***

MassDEP's asbestos regulation establishes that owners and operators (including contractors) are responsible for determining whether cement pipe in a particular utility conduit that will be repaired or replaced contains asbestos before starting demolition or renovation.

The methods described below can only be used at underground asbestos-cement pipe repair/replacement work conducted by public and privately-owned utilities or their contractors. Owners and operators who are not public or private utilities are subject to the survey requirements at 310 CMR 7.15(4) by employing or engaging an asbestos inspector to thoroughly inspect the pipe, including sampling and analysis for the presence of asbestos using approved EPA protocol.

An owner or operator (including utilities conducting pipe repair or replacement), must conduct a "thorough inspection" to determine the location and amount of any asbestos-containing pipe. A "thorough inspection" under 310 CMR 7.15(12A) shall be satisfied by one of the following three options:

- **Document Review:** The owner or operator shall review as-built plans or other documents identifying the content of particular cement pipes or pipe segments and any other material in the conduit that may be affected by a removal or repair project, provided that the documentation has been updated to reflect any repairs or alterations. "Other documents" may include analytical results from bulk sampling and asbestos analysis using an EPA-approved method, a manufacturer's Safety Data Sheet for the product as actually installed, or other irrefutable identifying information.
- **Visual Observation:** A person who has successfully completed a DLS-approved training course specific to asbestos cement pipe worker safety (e.g., the "8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety" course) or another course similar in length and content that has been reviewed and approved in writing by DLS shall conduct a visual identification through field observations of the pipe to be worked on (e.g., the manufacturer's brand-label markings indicating transite material or

the source of the pipe).

- **Presumption of Asbestos Containing Material:** The owner or operator may presume that a pipe or pipe segment contains asbestos and manage any repairs or removals in accordance with this guidance and 310 CMR 7.15(12A).

If the pipe or pipe segment is not identified as asbestos cement pipe by one of the options listed above, then the owner or operator shall comply with the requirements of 310 CMR 7.15(4) by performing a survey if the pipe contains suspect asbestos-containing material.

The owner/operator of the utility system at which the asbestos cement pipe was removed, repaired or replaced must keep documentation of the pre-demolition/renovation survey, signed and dated by the person who conducted the inspection, for a minimum of two (2) years in the project file. The documentation must indicate what information was relied upon to determine whether the pipe contained asbestos. (See Attachment A for a Pre-Demolition/Renovation Survey Documentation template.)

### ***b. Notification***

A notification must be submitted to MassDEP for each asbestos-cement pipe project on an Asbestos Notification Form ANF-001/BWP AQ-04 in accordance with 310 CMR 7.15(6). The notification must be submitted at least ten (10) working days before starting asbestos cement pipe removal. The ANF-001/BWP AQ-04 and answers to frequently asked questions about filing notifications are available at:

<https://www.mass.gov/how-to/aq-04-anf-001-asbestos-removal-notification>

The asbestos notification is filed online using MassDEP's online notification system, eDEP: <https://edep.dep.mass.gov/>

If you cannot wait the requisite 10 working-day notification period prior to starting work, you will need to request an emergency waiver from the MassDEP regional office that covers the town in which the project is located. (See the response to question number 4 in the "Frequently Asked Questions" section of this guidance document for more details on how to obtain an emergency waiver.) The MassDEP staff person who approves an emergency waiver will provide a project-specific waiver number that must be entered on the notification form in the relevant field.

A notification fee, currently \$100.00, is required when filing an ANF-001/BWP AQ-04. However, asbestos abatements at property owned by cities, towns, counties, districts of the Commonwealth, municipal housing authorities, federally recognized Indian tribe housing authorities, state agencies, the

Massachusetts Bay Transportation Authority, and owners of owner-occupied residential properties with four or fewer units are exempt from this fee.

Owners and operators who are planning to remove or repair several pipe segments over a specific period of time may apply to MassDEP for approval of a “blanket notification”, which would cover the entire project for a time period not to exceed one (1) year. While individual ANF-001/BW AQ-04 forms would still need to be submitted for each segment of the work, the blanket approval would eliminate the ten working day advance notification requirement for the individual filings. Information regarding asbestos blanket notifications may be found at:

<https://www.mass.gov/how-to/aq-05-asbestos-blanket-notification-approval>

An application fee of \$200 is required for each application for a blanket notification approval.

### ***c. Licensing and Training***

DLS’s regulation (453 CMR 6.00) establishes requirements for the use of contractors and other asbestos specialists who are licensed or certified by that Department. Please call DLS for all licensing and training questions. Contact information can be found in the response to Question 28 in the attached Frequently Asked Questions.

In lieu of hiring a DLS-licensed asbestos contractor, an owner or operator conducting asbestos abatement activity on underground asbestos cement piping may hire contractors or other entities who have completed the “8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety” course developed jointly by the MWWA and UCANE, or a course similar in length and content reviewed and approved in writing by DLS, provided that the owner, operator and contractor comply with the provisions and procedures described in this guidance document. To maintain one’s qualification, DLS requires that the contractor or other entity must complete 4-hour ACP Worker Safety Refresher Training at least every 5 years after the initial training.

### ***d. Specific Work Practice Requirements for Underground Asbestos-Cement Pipe.***

Owners/operators shall ensure the work practice standards listed below are followed:

1. Asbestos-cement pipe shall be handled in a manner that will minimize the risk of making it friable ACM or releasing asbestos dust into the environment.
2. At the start of work involving asbestos-cement pipe, owners/operators shall ensure that:
  - a. The asbestos-cement pipe shall be exposed with minimal disturbance.
  - b. Mechanical excavation shall not be used within six inches of the asbestos-cement pipe.

- c. The soil within six inches of the asbestos-cement pipe shall be uncovered by hand or with a shovel.
  - d. Once the pipe has been exposed, an assessment shall be made before proceeding to determine whether the asbestos-cement pipe is damaged, cracked or broken to determine whether the requirements of Section III.d.3. or 4. (below) apply to the asbestos abatement activity.
3. If the assessment shows that the asbestos-cement pipe is intact and not deteriorated:
  - a. Place 6 mil (0.006 inch) thick polyethylene sheeting under the asbestos cement pipe to prevent soil contamination.
  - b. Adequately wet the asbestos-cement pipe with amended water using surfactant or liquid soap before and during removal to avoid creating airborne dust.
  - c. Separate the asbestos cement pipe at the nearest coupling (bell or compression fitting).
  - d. Slide the asbestos-cement pipe apart at the joints (no saw cutting) or use other methods that do not cause the asbestos-cement pipe to break, become friable ACM or otherwise create the potential to release asbestos fibers.
  - e. Wrap wet asbestos cement pipe in two layers of 6 mil polyethylene sheeting, seal with duct tape and label (This may be done either in the trench or adjacent to the trench). Package any other asbestos-containing debris from the abatement in accordance with 310 CMR 7.15(7)(f)(3) – e.g., while wet, place debris in two plastic bags (six-mil minimum thickness each bag, one inside the other) or in leak-proof metal, plastic or plastic lined drums with locking lids.
  - f. If the trench is filled with water, the placement of polyethylene sheeting is not required.
4. If the asbestos-cement pipe is deteriorated or is not intact, or when the use of mechanical breakage with saws, snap or blade cutting, and/or tapping is necessary:
  - a. Place 6 mil (0.006 inch) thick polyethylene sheeting under the asbestos-cement pipe to prevent soil contamination.
  - b. Adequately wet asbestos-cement pipe with amended water where cutting or breaking will occur.
  - c. Saw cutting of asbestos-cement pipe shall only be conducted with a HEPA-shrouded vacuum attachment or wet cutting equipment, unless it is conducted within a small enclosure that isolates the area in which the saw cutting is being conducted to prevent the release of asbestos fibers to ambient air.
  - d. Wrap wet asbestos cement pipe in two layers of 6 mil polyethylene sheeting, seal with duct tape and label (This may be done either in the trench or adjacent to the trench). Package any other asbestos-containing debris from the abatement in accordance with 310 CMR 7.15(7)(f)(3) – e.g., while wet, place debris in two plastic bags (six-mil minimum thickness each bag, one inside the other) or in leak-proof metal, plastic or plastic lined drums with locking lids.

5. For activities that disturb friable ACM, no visible emissions shall be discharged to the outside air during the collection, processing, packaging or transporting of any ACM or ACWM.
6. Refer to Section “III.e.” of this guidance document for packaging, labeling, disposal, and record retention requirements.

### ***e. Packaging, Labeling, Disposal and Record Retention***

All ACWM must be packaged, labeled, transported, stored and disposed of in accordance with requirements specified at 310 CMR 7.15(15): Asbestos-containing Waste Material Packaging Requirements, 310 CMR 7.15(16): Asbestos-containing Waste Material Transport Requirements, 310 CMR 7.15(17): Asbestos-containing Waste Material Storage and Disposal Requirements, 310 CMR 7.15(18): Waste Shipment Records and Reports, and 310 CMR 19.061: Special Waste, including but not limited to the following:

- i. Place properly wrapped and labeled ACWM pipe as well as all other packaged ACWM and debris in a roll-off container(s), or covered trucks, trailers or vans that are lined with 2 layers of 6 mil polyethylene sheeting.
  - a. The container shall be an enclosed and sealed leak-tight container having proper labels and U.S. Department of Transportation placards as required.
  - b. If open-top roll-off containers are used, they must be properly sealed, labeled and secured inside a locked fenced area when they are not being loaded to prevent access by unauthorized personnel, and covered to prevent water accumulation.
- ii. Package, transport and dispose of ACWM in accordance with local, state, and federal regulations.
- iii. Complete waste shipment records must be retained for 2 years by the owner/operator of the facility that generated the ACWM.
- iv. Dispose of ACWM at a landfill permitted to accept ACWM.

**Please note:** “Bulk Loading”<sup>1</sup> of ACWM is not permitted without written approval from MassDEP - via approval of a Non-Traditional Asbestos Abatement Work Practice Application. (See BWP AQ-36 “Application for Non-Traditional Asbestos Abatement Work Practice Approval” <https://www.mass.gov/how-to/aq-36-non-traditional-asbestos-abatement-work-practice-approval> for information about how to apply for this permit.) Loading operations involving waste generated from asbestos cement pipe removal that is handled, packaged, labeled, containerized and stored/disposed of in accordance with Sections III.d. and III.e. of this guidance are not considered bulk loading

---

<sup>1</sup> “Bulk Loading” means the placement of unconfined ACWM in a vehicle or container, such as a roll-off, dumpster or truck *in lieu* of packaging the ACWM in individual leak tight containers.[310 CMR 7.15(1) Definitions

and do not require a Non-Traditional Asbestos Abatement Work Practice Approval.

### ***f. Visual Inspection Requirement***

When asbestos cement pipe removal is repaired or replaced, the final visual inspection shall be performed by a person who has completed a DLS-approved training course specific to asbestos cement pipe worker safety (e.g., the “8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety” course), or another course similar in length and content that has been reviewed and approved in writing by DLS).

The person conducting the final visual inspection shall:

- a. Inspect the work area to ensure there was no visible debris remaining:
  - i. In the excavation trench;
  - ii. In soil excavated from the trench;
  - iii. In the surrounding area adjacent to the trench after the removal of the asbestos cement pipe, and
  - iv. On any tools used during the removal/repair/replacement activities.
- b. Ensure that all ACWM has been removed for proper storage/disposal.

The person who conducted the final visual inspection shall sign and date the documentation of the final inspection, in a format provided by the Department, as evidence that the inspection was performed and that the condition of “no remaining visible debris” was met. Owners/operators shall keep such documentation at their regular place of business for two (2) years from the date of final visual inspection and provide it to the Department upon request. (See Attachment B for an example of a Post-Abatement Visual Inspection template.)

## **Frequently Asked Questions About Asbestos Cement Pipe Removal**

### **1. What is Asbestos? Is it hazardous to your health?**

Asbestos is a naturally occurring fibrous mineral consisting of any one of a number of silicates. Asbestos has been and is still used in a variety of products because of its physical properties, which make it resistant to heat, fire, and many caustic chemicals. Asbestos has been used extensively as fireproofing, an insulating agent, and for decorative purposes, among many other uses.

The physical properties that give asbestos its resistance to heat and decay are linked with several adverse human effects. Asbestos tends to break into a dust of

microscopic fibers. Because of their size and shape, these tiny fibers can remain suspended in the air for long periods of time and can easily penetrate bodily tissue when inhaled or ingested. Because of their durability, these fibers can remain in the body for many years.

Asbestos is known to cause asbestosis and various forms of cancer. **Asbestosis** is a chronic disease of the lungs that makes breathing progressively more difficult, and can lead to death. Cancer can result from breathing asbestos fibers and **lung cancer** is the most frequent. **Mesothelioma**, an incurable cancer of the chest and abdominal membranes, almost never occurs without exposure to asbestos. Asbestos-related diseases have a long latency period and may not show up until 10 to 40 years after exposure. Each exposure increases the likelihood of developing an asbestos-related disease.

## **2. How do I know whether cement pipes contain asbestos?**

Cement pipes used for public drinking water, waste water, roof drains or underground conduits may contain asbestos and should be handled in accordance with MassDEP's asbestos regulation (310 CMR 7.15) and the specific "Requirements for Underground Asbestos-Cement Pipe" (310 CMR 7.15(12A)) unless the owner possesses documentation based on sampling and analysis, in accordance with approved EPA test methods, that has shown that they do not contain asbestos. It is the obligation of anyone removing or repairing materials that contain asbestos to handle them in accordance with applicable laws and regulations. Ignorance or avoidance of this responsibility does not remove this obligation.

Up-to-date as-built plans, reviewed by the owner/operator, that accurately identify the material that pipes or pipe segments are made of can be relied on to confirm that the pipe contains asbestos.. Another acceptable method for determining whether a pipe or pipe segment contains asbestos is through visual identification in the field at the time of excavation, when the pipe material is readily identifiable by observing the manufacturer's brand-label (e.g. Johns-Manville Transite) or other markings on the pipe (e.g., indicating its source). This identification must be done by a person who has completed a DLS-approved training course specific to asbestos cement pipe worker safety (e.g. the "8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety" course) or another course similar in length and content that has been reviewed and approved in writing by DLS). If up-to-date as-built plans are not available and a definitive visual identification cannot be made, the owner/operator can presume the cement pipe contains asbestos and handle it in accordance with this guidance.

## **3. Does MassDEP have to be notified prior to beginning an asbestos cement pipe removal or repair project?**

Yes, the owner/operator of a facility containing asbestos cement pipes must notify MassDEP ten working days before removing or repairing asbestos cement pipes. Notification is required no matter who is doing the removal/repair or how much

asbestos cement pipe is being removed or repaired. Please note that notification is required for repairs of asbestos cement pipe using tools that are considered “non-destructive” or “fail-safe” such as metal compression patches, wet tapping, etc. (See response to Question number 4 below for how to satisfy the notification requirement in the case of an emergency situation.)

#### **4. We have an emergency and the pipe(s) need to be repaired immediately. Can we make the necessary repairs prior to submitting notification to MassDEP?**

Yes, if MassDEP grants you an “emergency waiver.” Work can be performed right away by calling the appropriate regional MassDEP office and obtaining an emergency waiver of the ten (10) working day waiting period. To identify the regional office for the town in which your project is located, please go to the MassDEP website at the following URL: <https://www.mass.gov/service-details/massdep-regional-offices-by-community>. Simply call the service center and ask for the asbestos program staff, or call the asbestos program staff member listed in response to FAQ number 27 below. The MassDEP staff person who approves an emergency waiver will provide a project-specific waiver number that must be entered on the notification form in the relevant field.

If the emergency occurs after business hours or on a weekend, leave a detailed message including your contact information on voice mail for the MassDEP asbestos inspector’s voice mail and proceed with the repairs as detailed in this document. You should then follow up with MassDEP on the following business day. You will still be required to submit an asbestos notification form ANF-001/BWP AQ-04 within 24 hours of the removal.

In addition, you can conduct the work without the required ten working day notification period if you have a MassDEP approved asbestos blanket notification. Information regarding asbestos blanket notifications may be found under the heading “BWP AQ 05 - Application for Asbestos Blanket - Form and Guidance” at the following link: <http://www.mass.gov/eea/agencies/massdep/service/approvals/bwp-aq-05.html>.

#### **5. Is there a notification form I should use?**

Notification for asbestos cement pipe removal must be made by completing and submitting to MassDEP the MassDEP-approved Asbestos Notification Form ANF-001 (also known as BWP AQ-04). The Asbestos Notification Form is available on MassDEP’s web site at <http://www.mass.gov/eea/agencies/massdep/service/approvals/bwp-aq-04-anf-001.html> . The asbestos notification can be filed online via MassDEP’s website. See question number 10 below.

## **6. When must the notification be submitted?**

The regulations require that the notification must be submitted at least ten working days in advance of the start of the asbestos cement pipe removal project. “Working days” do not include Saturdays, Sundays, or any day that MassDEP offices are closed for business, such as legal holidays.

## **7. When does the ten working day waiting period begin and end?**

Your 10 working day waiting period will start when you submit your form, and you will receive an automatic notification that the submittal was received.

Please note that you must start work on the “start date” and end on the “end date” you indicate on the ANF-001. If you change the start date, you must revise your notification prior to the original start date indicated and allow for a full ten-day waiting period prior to the revised start date. If you need to start work sooner than ten days before the revised start date, call the MassDEP regional office to request an emergency waiver of the ten-day waiting period. (See Emergency Waiver information found at FAQ no. 4.) If you start and end work on the dates indicated in the original notification, but work intermittently within that period, that does not require a revision - simply notify the MassDEP regional office which days will not be performing work.

## **8. Will I be notified when I can begin the work?**

No. Unless MassDEP contacts you with a statement of deficiencies about your notification, you can begin work on the "project start date" you entered on the Asbestos Notification Form ANF-001. When completing the ANF-001, be sure that the "project start date" falls on or after the 10 working day wait period.

## **9. Is a fee required for filing an asbestos notification?**

The notification fee required by MassDEP regulations (310 CMR 4.00: Timely Action Schedule and Fee Provisions) for asbestos removal is \$100 per notification. A notification revision requires re-filing the notification and payment of a \$35 fee.

Please note: owners of owner-occupied residential properties with four or fewer units, cities, towns, counties, districts of the Commonwealth, municipal housing authorities, federally recognized Indian tribe housing authorities, state agencies and the MBTA are not subject to the asbestos notification fee. However, state agencies are subject to fees greater than \$100 (e.g., the \$200 Blanket Notification Approval application fee).

## **10. How do I submit the ANF-001 to the MassDEP?**

Notification must be made on a current version of the MassDEP Asbestos Notification Form (ANF-001), which satisfies the requirements of both MassDEP and

DLS regulations (See: <https://www.mass.gov/how-to/aq-04-anf-001-asbestos-removal-notification>.) Follow these steps:

1. If you have not already done so, register online with <https://edep.dep.mass.gov/edep/>. Select “New User” and complete the required steps. It should take no more than five minutes to complete the registration process, and you can begin online filing of your notifications right away.
2. The eDEP Asbestos Notification Form and Instructions are available at: <https://www.mass.gov/guides/massdep-asbestos-construction-demolition-notifications>
3. When filing via eDEP, you will pay the fee online using a credit card. Please note that “fee decals” are no longer sold and cannot be used to file online.
4. When filing electronically through eDEP, your 10-working day waiting period will start when you submit your form, and you will receive an automatic notification that the submittal has been recorded.

#### *Troubleshooting*

If you get an error message after you click “Error Check & Next” at the end of the form that says “License # is not recognized,” please check to make sure you typed the DLS License and Certification Numbers for the asbestos contractor, on-site supervisor/foreman, project monitor, and asbestos analytical lab number correctly. (Please note: Only fill in the fields for the DLS license/certification #'s for questions 6-9 in Section A of the form. The fields with the corresponding names and addresses will be pre-populated when you click “Error Check & Next.”)

If the project does not require the use of a DLS-licensed asbestos contractor, then simply check off the appropriate boxes on the BWP AQ04 (ANF-001) PreForm and when you click “Error Check & Next,” it will automatically pre-populate the asbestos contractor and asbestos supervisor fields (i.e. questions 6 and 7) to reflect work by a “Non Licensed Removal.” For the project monitor and analytical lab information (i.e. questions 8 and 9) for this type of “Non Licensed Removal” situation, you can enter the DLS certification number in the appropriate data field if one of those disciplines will be used on the project. Or if those disciplines will not be used, then you can simply enter “N/A” in the DLS Certification data fields and leave the “Name” data fields blank.

If you still get an error message pop-up box, please contact the MassDEP data systems group: [BAW.eDEP@state.ma.us](mailto:BAW.eDEP@state.ma.us)

### *eDEP Features*

Use of the eDEP online notification system ensures that you are using the most current form, and that you have provided all required information. Filing your ANF-001 Notification online via eDEP helps avoid common mistakes. Furthermore, electronic filers can see all of the Construction/Demolition Notification Forms they have submitted on-line by clicking on the “My eDEP” tab in the upper left corner of your log-in screen. In the event that either the project start date or end date changes, triggering the requirement to file a notification revision, the simplest way to do this is by filing a notification revision online via eDEP. (See Question 10 for more information on filing notification revisions.)

If you are unable to use the eDEP online notification system to file your ANF-001, you may file an alternate format (e.g. a paper version of the ANF-001) by emailing a request to [BAW.eDEP@state.ma.us](mailto:BAW.eDEP@state.ma.us). Please include a phone number where you can be reached so that MassDEP can help you in your request. If you have any questions or desire further information about filing electronically through eDEP, please email your inquiry to [BAW.eDEP@state.ma.us](mailto:BAW.eDEP@state.ma.us).

### **11. Do I need to notify other government agencies in addition to the MassDEP?**

You may be required to notify the local Building Department, Fire Department, or Board of Health in the city or town where the asbestos is being removed. Always contact local officials to ask what notification or permits are required. Submittal of a complete ANF-001 to MassDEP satisfies **state** (both MassDEP and DLS) and **federal** notification requirements (e.g., EPA Asbestos NESHAP) for projects that will remove or disturb asbestos-containing material.

### **12. Do I need to hire an asbestos contractor to repair and/or remove asbestos cement pipe?**

DLS’s regulation (453 CMR 6.00) establishes requirements for the use of contractors and other asbestos specialists who are licensed or certified by DLS. Please call DLS for all licensing and training questions. Contact information can be found in the response to Question 28 in the attached Frequently Asked Questions.

In lieu of hiring a DLS-licensed asbestos contractor, an owner or operator conducting asbestos abatement activity on underground asbestos cement piping may hire Contractors or other entities who have completed the “8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety” course or a course similar in length and content reviewed and approved in writing by DLS, provided that the owner, operator and contractor comply with the provisions and procedures that are described in this guidance document.

**13. Can I crush the asbestos cement pipe in the trench and place new pipe over it?**

No, crushing an asbestos cement pipe and leaving it in the trench is prohibited under 310 CMR 7.15. Further, the EPA has determined that backfilling and burial of the crushed asbestos cement pipe would cause these locations to be considered active disposal sites and therefore subject to the “Standard for Active Waste Disposal Sites” (40 CFR 61.154).

**14. Can I “ream” or “pipe burst” new water supply pipe through existing asbestos cement pipe?**

No, this is not allowed because reaming or pipe bursting through an existing asbestos cement pipe would cause the existing asbestos cement pipe to become crushed and “friable” (see response to question number 13 above).

**15. What if the trench is filled with water which prevents the placement of polyethylene sheeting below the asbestos cement pipe (as required in Section IV.d. – Handling Practices)?**

If the trench is filled with water, the placement of polyethylene sheeting is not required, as stated in Section III.d – Specific Work Practice Requirements. However, any visible debris must be managed in accordance with the requirements of Section III.e. – Packaging, Labeling, Disposal and Record Retention and III.f. – Visual Inspection Requirement.

**16. What should I do with the water in the trench?**

For work on the intact asbestos cement pipe(s), first try to pump the water out to a storm drain prior to any work. If there is substantial damage to the asbestos cement pipe and there are numerous pieces immersed in standing water, then the contaminated water should be pumped out and filtered through a 5 micron filter before the water is discharged.

**17. Am I required to remove asbestos cement pipe that will not be disturbed by repair or replacement activities?**

MassDEP only requires the removal of asbestos cement pipe that is exposed and will be disturbed during repair or replacement activities.

When a section of asbestos cement pipe is being repaired or replaced, the remaining portions of that pipeline are not required to be removed, provided that they are not exposed by excavation activity.

Additionally, if a section of asbestos cement pipe that is being actively used (e.g., a utility conduit) is exposed by excavation but will not be impacted by the repair or replacement work, it may be left in place and backfilled.

**18. Where can I obtain the packaging and labeling materials?**

The MassDEP-required asbestos warning labels and asbestos waste bags may be obtained from industrial supply houses, insulation supply houses, or may be purchased directly from licensed asbestos contractors. Polyethylene sheeting and duct tape are widely available from hardware, home supply and other stores.

**19. Can I store waste asbestos cement pipe?**

Asbestos cement pipe waste material that has been properly wetted, packaged in sealed, leak-tight containers, and labeled can be temporarily stored for up to thirty (30) days at a secure location on property owned or controlled by the owner or operator of the public/private utility system or at the place of business of the company/contractor removing asbestos-cement pipe from its site of origin. The storage location must be secured (e.g., storage in a locked fenced-in area) and maintained in accordance with all federal, state and local requirements. Contact local officials to determine if temporary storage of asbestos cement pipes is allowed in your municipality.

**20. Can I store unused “virgin” asbestos cement pipe?**

Unused (i.e. “virgin”) asbestos cement pipe that is still suitable for use is not considered an ACWM, and is therefore not subject to the ACWM storage limitations. Measures should be taken to ensure that stored virgin asbestos cement pipe does not become deteriorated by constant exposure to the elements. If virgin asbestos cement pipe deteriorates so that it is no longer suitable for use, then it would be considered ACWM and subject to all the applicable packaging, labeling, storage and disposal requirements at 310 CMR 7.15(15) – (18).

**21. Can I dispose of the asbestos cement pipes with my other solid waste?**

No. The asbestos cement pipes must be managed as a “Special Waste” (requiring proper packaging, labeling, and disposal) and in Massachusetts may only be disposed of at a facility that is permitted to accept ACWM under 310 CMR 19.061 (“Special Waste” regulation).

**22. How can I find a place to dispose of the asbestos cement pipes?**

The best option is to hire a waste hauler or asbestos contractor to transport the asbestos cement pipes to a disposal facility. Many waste haulers and asbestos contractors are familiar with various disposal facilities and frequently transport wastes to facilities permitted to accept ACWM.

You also can contact a landfill directly and arrange to transport the waste to the landfill yourself. ACWM can only be disposed at a solid waste landfill permitted to accept “Special Waste”, which in Massachusetts must be operated in accordance with regulatory requirements specified at 310 CMR 19.061, or in another state, in

accordance with the relevant “Special Waste” permit requirements. You should contact the facility in advance of transporting ACWM for disposal.

ACWM may not be sent to an incinerator or to a construction and demolition (C&D) debris processing facility in Massachusetts. Likewise, no Massachusetts transfer stations are permitted to accept ACWM.

### **23. How do I find an asbestos waste hauler?**

Asbestos waste haulers may be located by using any available internet search engine or by looking this topic up in the Yellow Pages. Try entering/looking under topics such as "rubbish," "waste" or "asbestos." Any firm hauling ACWM must be registered with the Federal Highway Administration’s Motor Carrier Division. Call the nearest regional MassDEP office for additional help.

### **24. Can I transport the waste asbestos cement pipes myself?**

Waste asbestos cement pipe that has been packaged and labeled in accordance with Section III.e. – Packaging, Labeling, Disposal and Record Retention, may be transported in a covered truck, trailer or van to a secured, temporary storage location at property owned or controlled by the pipe owner or operator or at the place of business of the company/contractor that removed the asbestos-cement pipe from the excavation, as outlined in question 19. If a van is used, the waste asbestos cement pipe should be transported in a compartment separate from the driver or passenger seats. A pickup truck bed should be covered with an impermeable tarpaulin cover and secured so that it does not allow the accumulation of rain water. The waste containers should not be loaded above the side rails in any truck or trailer.

### **25. Is there any paperwork required for transporting the waste asbestos cement pipes?**

Yes. 310 CMR 7.15(18): Waste Shipment Records and Reports requires that an asbestos Waste Shipment Record (WSR) document accompanies each shipment of ACWM. Waste hauling companies and/or asbestos removal companies can supply WSR forms. (A template for the WSR form is available at: <https://www.mass.gov/guides/massdep-asbestos-construction-demolition-notifications>). The WSR must be signed by each company or person involved with removal, transportation and disposal of the ACWM, including the facility owner or “generator” of the asbestos. The asbestos removal contractor may sign on behalf of the owner.

Pursuant to 310 CMR 7.15(18), if a completed copy of the WSR, signed by the disposal facility to acknowledge receipt of the waste shipment, is not received back by the generator within 35 days of the initial shipment, the generator must contact the transporter or disposal facility to determine the status of the waste shipment. This section of the regulation also requires the generator to notify the MassDEP regional office in writing if the generator does not receive a signed copy of the WSR from the disposal facility within 45 days of the date of shipment. The generator, the transporter, and the disposal facility must each retain a copy of the WSR signed by all

the parties for at least two years. You do not need to send a completed copy of the WSR to any regulatory agency, but MassDEP may request a copy of the WSR from any of the parties in the event of an inspection.

Additionally, transportation of asbestos (which is designated as a hazardous material for transportation) is regulated by the U.S. Department of Transportation (US DOT), which has established requirements for shipping documents, packaging, labeling, and vehicle placarding (49 CFR 173.1090): asbestos must be loaded, handled and unloaded in a manner that will minimize occupational exposure to airborne asbestos fibers released during transit. US DOT also requires that transporters carry identification papers for all quantities of asbestos greater than 1 pound. The Massachusetts state police enforce this requirement.

## **26. Does MassDEP have a document containing general information about asbestos?**

Yes. The “Asbestos Information and Resource Guide” is available <https://www.mass.gov/guides/massdep-asbestos-construction-demolition-notifications>. The guide includes contact information for various government agencies responsible for asbestos, a list of regulations governing asbestos, and general information about asbestos and asbestos removal.

## **27. How do I contact MassDEP for more information?**

For more information on asbestos or other environmental issues, please visit MassDEP’s website at [www.mass.gov/dep/about/contacts.htm](http://www.mass.gov/dep/about/contacts.htm) or contact the following MassDEP officials:

**Boston:** (For general information about asbestos policy/regulation and notification/fees) Mike Elliott at 617-292-5575 or [michael.elliott@mass.gov](mailto:michael.elliott@mass.gov)

**Central Region:** Gregg Levins at 508-767-2768 or [gregory.levins@mass.gov](mailto:gregory.levins@mass.gov)

**Northeast Region:** John MacAuley at 978-694-3262 or [john.macauley@mass.gov](mailto:john.macauley@mass.gov)

**Southeast Region:** Cynthia Baran at 508-946-2887 or [cynthia.baran@mass.gov](mailto:cynthia.baran@mass.gov)  
Emergency Waiver Hotline: 508-946-2882

**Western Region:** Marc Simpson at 413-755-2115 or [marc.simpson@mass.gov](mailto:marc.simpson@mass.gov)

## **28. How do I contact Massachusetts DLS?**

For information about DLS asbestos training, certification and/or licensing, contact:

Massachusetts Department of Labor Standards/Asbestos Program  
Charles Hurley Building  
19 Staniford Street, 2nd Floor  
Boston, MA 02114

## Template A: Pre-Demolition/Renovation Survey Documentation

### 1. Project Location:

\_\_\_\_\_  
(Street address, GPS coordinates or other location identification)

City/Town: \_\_\_\_\_, MA

### 2. Pre-Demolition/Renovation Survey

Survey Date: \_\_\_\_\_

MassDEP's asbestos regulation requires owners and operators (including contractors) to determine whether cement pipe in the utility conduit that will be disturbed contains asbestos. Please identify the information that was used to determine whether the pipe at this location contains asbestos by checking all applicable boxes:

Accurate, up-to-date as-built plans or other utility network documents. Specify title and revision date of the as-built drawing or other documentation:

\_\_\_\_\_  
 Visual identification/ field observations of exposed pipe. Specify manufacturer's brand-label marking (e.g. "Johns-Manville Transite") or other features used to identify composition/source of pipe:

\_\_\_\_\_  
 I was physically present at the location described above and personally observed the pipe or pipe segment when it was exposed and before it was removed, replaced and/or repaired.

Presumed that pipe contained asbestos.

Relied on representative samples that were analyzed at a certified laboratory.

Identify Laboratory and DLS certification number: \_\_\_\_\_

Date samples were collected: \_\_\_\_\_ Date of lab report: \_\_\_\_\_

Result of the analysis (% asbestos): \_\_\_\_\_

**Does the pipe (or pipe segment) that will be disturbed contain asbestos?**  Yes  No

**If "Yes", what is the MassDEP Asbestos Notification Number (ANF-001 Form)?** \_\_\_\_\_

### 3. Qualifications. Please check the applicable box:

I have successfully completed the "8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety" course approved by the Massachusetts Department of Labor Standards (DLS), or a course similar in length and content reviewed and approved in writing by DLS; or

I am a DLS-certified Asbestos Inspector.

Title/Company: \_\_\_\_\_

Signature: \_\_\_\_\_ Date: \_\_\_\_\_

## Template B: Post-Abatement Visual Inspection Documentation

### 1. Project Location/Identification:

\_\_\_\_\_  
(Street address, GPS coordinates or other location identification)

City/Town: \_\_\_\_\_ MA

MassDEP Asbestos Notification Number (ANF-001 Form): \_\_\_\_\_

### 2. Post-Abatement Visual Inspection

Date of Visual Inspection: \_\_\_\_\_

When any repair/removal of an asbestos cement pipe or pipe segment is complete, a visual inspection must be done before the trench is backfilled to confirm that ALL of the following conditions have been met. Please check each condition below to document that the visual inspection confirmed:

- No visible debris was present in trench.
- No visible debris was present outside of the trench (e.g. in excavated soils and the immediately surrounding area).
- No visible contamination was seen on tools.
- All Asbestos Containing Waste Material has been removed from the area for proper disposal.
- I was physically present at the location described above and personally conducted this inspection while the pipe or pipe segment was exposed and before the trench was backfilled.

### 3. **Qualifications.** Please check the applicable box:

- I have successfully completed the "8 hour OSHA Class II Asbestos Training: Asbestos Cement Pipe (ACP) Worker Safety" approved by the Massachusetts Department of Labor Standards (DLS), or a course similar in length and content reviewed and approved in writing by DLS; or
- I am a DLS-certified Asbestos Project Monitor.

PROJECT NOTIFICATION FORM

After review of MHC files and the materials you submitted, it has been determined that this project is unlikely to affect significant historic or archaeological resources.

Project Name: Wells 2, 3, and 4 Water Treatment Plant

Location / Address: 15 Tree Lane

City / Town: Town of Sharon, Massachusetts

Project Proponent

Name: Eric Hooper, Department of Public Works Superintendent

Address: 217R South Main Street, BOX 517

City/Town/Zip/Telephone: Town of Sharon, Massachusetts 02067

Edward L. Bell  
Deputy State Historic Preservation Officer  
Massachusetts Historical Commission

(781) 784-1525 ext. 2311

Agency license or funding for the project (list all licenses, permits, approvals, grants or other entitlements being sought from state and federal agencies).

Agency Name

Type of License or funding (specify)

Refer to the Attached License/Funding List

Project Description (narrative):

The project consists of the construction of a water treatment plant at the 15 Tree Lane site, the existing site of Well 4. Site improvements include the construction of an access road, a building (7,500 square feet), infiltration basins to attenuate stormwater, and new water main piping to connect the well sites to the new treatment facility.

Does the project include demolition? If so, specify nature of demolition and describe the building(s) which are proposed for demolition.

This project includes the possible demolition of the existing chemical building located south of the proposed WTP, as the building will no longer be needed following construction of the proposed facility.

Does the project include rehabilitation of any existing buildings? If so, specify nature of rehabilitation and describe the building(s) which are proposed for rehabilitation.

Yes, the project includes rehabilitation of existing water treatment equipment and support systems. The existing chemical equipment will be removed at all well sites. Hazardous material assessments will also be conducted to determine whether additional rehabilitation is needed.

Does the project include new construction? If so, describe (attach plans and elevations if necessary).

Yes, the project includes the construction of a new water treatment plant. Refer to Figure 3 for a preliminary design plan.

950 CMR: OFFICE OF THE SECRETARY OF THE COMMONWEALTH

APPENDIX A (continued)

To the best of your knowledge, are any historic or archaeological properties known to exist within the project's area of potential impact? If so, specify.

No.

What is the total acreage of the project area?

Woodland	<u>±3.1</u>	acres	Productive Resources:	
Wetland	<u>+0.9</u>	acres	Agriculture	_____ acres
Floodplain	<u>+1.6</u>	acres	Forestry	_____ acres
Open space	<u>0</u>	acres	Mining/Extraction	_____ acres
Developed	<u>±0.7</u>	acres	Total Project Acreage	<u>6.3</u> acres

What is the acreage of the proposed new construction? 0.17 acres (building only)

What is the present land use of the project area?

The project area is adjacent to an existing paved right-of-way and is currently undeveloped (wooded).

Please attach a copy of the section of the USGS quadrangle map which clearly marks the project location.

Please refer to the attached Figure 1 and Figure 2.

This Project Notification Form has been submitted to the MHC in compliance with 950 CMR 71.00.

CERTIFICATE OF THE SECRETARY OF ENERGY AND ENVIRONMENTAL AFFAIRS  
 ON THE  
 SINGLE ENVIRONMENTAL IMPACT REPORT

PROJECT NAME : Wells 2, 3, and 4 Water Treatment Plant  
 PROJECT MUNICIPALITY : Sharon  
 PROJECT WATERSHED : Boston Harbor  
 EEA NUMBER : 16725  
 PROJECT PROPONENT : Town of Sharon  
 DATE NOTICED IN MONITOR : October 23, 2023

Pursuant to the Massachusetts Environmental Policy Act (MEPA; M.G.L. c. 30, ss. 61-62L) and Section 11.08 of the MEPA regulations (301 CMR 11.00), I have reviewed the Single Environmental Impact Report (Single EIR) and hereby determine that it **adequately and properly complies** with MEPA and its implementing regulations.

Project Description

As described in the Single EIR, the project consists of the construction of a new 7,500-square foot (sf) water treatment plant (WTP) with a capacity of 1.85 million gallons per day (mgd), approximately 1.1 miles of new water mains to connect three existing (Wells 2, 3 and 4) to the WTP, and upgrades to three existing well stations. The proposed WTP will be constructed at the Well 4 site to treat water from Wells 2, 3 and 4, using chemical and filtration treatment systems, including potassium hydroxide for pH adjustment; sodium hypochlorite for disinfection and oxidation; three vertical pressure filters for the removal of iron and manganese; sodium bisulfite for dechlorination; bag filtration for solids removal; an adsorptive media vessel-based treatment for removal of PFAS; and standard finishing processes such as the addition of fluoride to water. The WTP will be designed as a “zero discharge” facility; process waste streams will be directed into the backwash waste tank then recycled to the head of

the WTP. Settled solids in the backwash tank will be periodically pumped to a tanker truck for off-site disposal. The WTP will also include a new driveway off Tree Lane near the existing driveway to the Well 4 site that parallels Tree Lane and ends in a parking area at the northern end of the site and a new stormwater management system.

Water from Wells 2, 3 and 4 will be pumped to the new WTP. A new 8-inch raw water main will be constructed using horizontal directional drilling (HDD) under Beaver Brook and associated wetlands to convey water from Well 3 to the existing Well 2 10-inch discharge water main. The 10-inch water main, in turn, will convey raw water from Wells 2 and 3 to a proposed 8-inch raw water main at the end of the Well 2 access drive that will transmit raw water to the proposed WTP. The proposed 8-inch water main will be installed between the Well 2 access drive and the proposed WTP at the Well 4 site following a route along Moose Hill Parkway, Depot Street and Tree Lane. A new 8-inch water main will be installed to convey raw water from Well 4 to the proposed WTP. The existing well stations at Wells 2, 3, and 4 will be upgraded with new pumps and electrical systems within the existing well station buildings.

The Town's water supply consists of six groundwater wells. Wells 2, 3 and 4 have a maximum daily withdrawal rate of 1.85 mgd; however, the Town is authorized to withdraw only 1.28 mgd from these sources. Water samples collected from Wells 2 and 3 over the last two years detected levels of iron and manganese in Well 2 that exceeded the SMCL and levels exceeding the SMCLs for manganese in Well 3. The Town began testing for PFAS in its wells after MassDEP established a PFAS MCL of 20 parts per trillion (ppt) in 2020. Water samples collected from Wells 2, 3 and 4 were found to contain PFAS at levels above the MCL. The Town installed a temporary PFAS treatment system at Well 4, where PFAS levels were nearly 5 times the MCL, and removed Well 2 from service. The Town is not proposing any change to the permitted withdrawal rate from the wells. The purpose of the project is to ensure that the Town can continue to use Wells 2, 3, and 4, which provide water to most of the Town's residents.

### Project Site

The site of the proposed WTP consists of two Town-owned parcels in central Sharon with a combined area of approximately 6.3 acres. The site is bordered to the east by railroad tracks used by the Massachusetts Bay Transportation Authority (MBTA) Providence/Stoughton commuter rail and Amtrak; to the south by Upland Road and Depot Street; to the west and northwest by residences along Tree Lane and Pine Grove Avenue; and to the north by undeveloped forested land. The site slopes steeply from elevation 205 feet (ft) NAVD 88 adjacent to wetlands associated with Beaver Brook in the eastern part of the site to an elevation approximately 240 ft NAVD 88 at Tree Lane. The existing Well 4 facility is located in the central part of the site at elevation 215 ft NAVD 88 and is accessed by an unpaved driveway off Tree Lane. Most of the site is forested, except for Beaver Brook and associated wetland resource areas in the eastern and southern parts of the site. According to the Federal Emergency Management Agency National Flood Hazard Layer, a 100-year floodplain (Zone AE) with a Base Flood Elevation (BFE) of 204 ft NAVD 88 is located in the low-lying part of the site adjacent to Beaver Brook; the southernmost section of the floodplain is designated as a regulatory floodway. The 100-year floodplain is regulated as Bordering Land Subject to Flooding (BLSF) under the Wetlands Regulations (310 CMR 10.00).

Well 2 is located in a wooded, undeveloped area approximately 0.6 miles southwest of Well 4 and the proposed site of the WTP. It is accessed by a driveway off Moose Hill Parkway. Well 2 is bordered to the east by a large wetland associated with Beaver Brook, to the south and west by undeveloped land owned by MassAudubon and to the north by undeveloped land and Moose Hill Parkway. The site is located within the 100-year floodplain (Zone A) with a BFE of 216 ft NAVD 88. Well 3 is located approximately 0.4 miles south of Well 2 and the northern end of Farnham Road. It is bordered to the north and west by the large wetland system associated with Beaver Brook, to the east by the Town's composting site and to the south by undeveloped land and a residential neighborhood along Sandy Ridge Circle.

Wells 2 and 3 are located within one mile of an Environmental Justice (EJ) population<sup>1</sup> (Block Group 3, Census Tract 4141) designated as Minority located in southwest Sharon. The location of the proposed WTP at the Well 4 site is not located within one mile of an EJ population. The project areas are within five miles of 32 additional EJ populations in Stoughton, Canton, Norwood, Walpole and Foxborough designated as Minority and Minority and English Isolation.

### Environmental Impacts and Mitigation

Potential environmental impacts associated with the project include alteration of 46,480 sf (1.07 acres) acres of land, including removal of trees and site regrading; creation of 19,450 sf (0.45 acres) of impervious area; and alteration of approximately 63,595 sf (1.46 acres) of Riverfront Area. The project will also temporarily impact BLSF in connection with installation of new water mains; however, this impact was not quantified because no regrading or construction of new permanent structures are proposed in BLSF.

The purpose of the project is to provide safe drinking water by reducing levels of PFAS, manganese and iron from three of the Town's drinking water wells. Measures to avoid, minimize, and mitigate environmental impacts include construction of a new stormwater management system, the use of erosion and sedimentation controls during project construction, use of HDD to avoid impacts to wetland resource areas due to construction of the raw water main under Beaver Brook, the restoration of temporarily disturbed areas following construction, and measures to increase the resiliency of proposed structures.

### Jurisdiction and Permitting

This project is subject to MEPA review because it requires an Agency Action and meets/exceeds the thresholds at 301 CMR 11.03(4)(b)(4) (construction of a New drinking water treatment plant with a Capacity of 1,000,000 or more gpd) and 301 CMR 11.03(3)(b)(1)(f) (alteration of ½ or more acres of any other wetlands (Riverfront Area)). The project requires the preparation of an EIR pursuant to 301 CMR 11.06(7)(b) because it is located within a DGA (1 mile) around one or more EJ Populations. The project will require a BRP-WS 24 (Approval to Construct a Water Treatment Facility) permit from MassDEP.

The project requires an Order of Conditions from the Sharon Conservation Commission (or in

---

<sup>1</sup> "Environmental Justice Population" is defined in M.G.L. c. 30, § 62 under four categories: Minority, Income, English Isolation, and a combined category of Minority and Income.

the case of an appeal, a Superseding Order of Conditions from MassDEP) and a National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP) from the U.S. Environmental Protection Agency (EPA).

The project is seeking Financial Assistance from the State Revolving Fund (SRF) Drinking Water Program, administered by MassDEP. Therefore, MEPA jurisdiction is broad in scope and extends to all aspects of the project that may cause Damage to the Environment, as defined in the MEPA regulations.

#### Changes Since the Filing of the Expanded Environmental Notification Form (EENF)/Proposed EIR

The Single EIR identified the following changes to the project since the filing of the EENF/Proposed EIR:

- The WTP has been redesigned with a residential façade rather than a barn-like façade;
- The orientation of the WTP has been adjusted to provide a larger buffer between the facility and Tree Lane; and,
- To minimize impacts to wetlands, the proposed water main between Well 2 and Well 3 will be constructed entirely using horizontal directional drilling (HDD) rather than by a combination of trenching and HDD.

#### Review of the Single EIR

The Single EIR was generally responsive to the limited Scope included in the Certificate on the EENF/Proposed EIR. It reviewed the Town's public engagement efforts since the EENF/Proposed EIR was filed, provided updated plans showing wetland resource area boundaries in relation to project components and impact estimates, provided the results of a Sound Analysis, and reviewed resiliency measures incorporated into the design of the project. It provided responses to comments received on the EENF/Proposed EIR and included draft Section 61 Findings.

The Single EIR included a Sound Analysis which summarized the results of an evaluation of secondary noise impacts associated with the proposed WTP. The analysis modeled the impacts of the facility at the proposed location at the Well 4 site on Tree Lane and at the Well 3 site off Farnham Road, which is one of the alternative locations for the WTP evaluated in the EENF. The analysis was conducted by the Town in response to concerns from residents north and west of the Well 4 site; the residents indicated that the site, which consists of a wooded hillside under existing conditions, would no longer provide a noise buffer between the residential area and trains passing along tracks south and east of the Well 4 site. The analysis was based on background sound levels recorded at the proposed WTP site and the alternative WTP site at Well 3, and modeled changes in sound levels due to both the removal of trees and the reflection of sound waves off the proposed building at each site. The analysis concluded that the proposed would cause a change in sound levels ranging from a decrease of 3 decibels (dB) to an increase of 3 dB at nearby residences at both locations. According to the Single EIR, a change of 3 dB would not be expected to be noticeable. The analysis did not evaluate the noise generated by operation of the proposed WTP; according to the Town, all operations will be confined to the interior of the building and will not be audible at adjacent residences. I encourage the Town to conduct a more comprehensive noise study prepared consistent with MassDEP's Noise Policy and to incorporate

measures to sound impacts from construction and operation of the WTP to the maximum extent practicable.

### *Alternatives Analysis*

The Single EIR provided supplemental information for the three alternative WTP sites reviewed in the EENF/Proposed EIR, including revised estimates of the environmental impacts associated with each alternative.<sup>2</sup>

Build Alternative A1 would construct the WTP at a site near Well 2 and its access road, and installation of approximately 6,000 ft of new water main between the site and Well 4. The WTP would be constructed in a level area that has been mostly cleared of trees located at the base of a steep hill. The site is in a remote area with no nearby residences or other uses. However, the site is entirely located within Riverfront Area and within the 100-year floodplain of Beaver Brook with a BFE of 216 ft NAVD 88 and would have the greatest impacts to these resource areas than any of the other alternatives. The ground level at the site is at elevation 208 ft. According to the Town, MassDEP typically requires that new water treatment facilities and their access roads be located at least two feet above the 100-year floodplain, which in this case would require construction of the building 10 feet above existing grade and elevating the access road by a similar amount. The Single EIR also indicated that, because the project is seeking federal funding, it would have to comply with the requirement that the first-floor elevation of the WTP be three feet above the 100-year flood elevation, or 11 feet above the existing grade. In addition, the cleared area is too small to accommodate the footprint of the WTP, which would require additional site clearing and regrading. According to the Single EIR, the addition of 11 feet of fill to raise the site of the WTP, and a comparable amount of fill to elevate the roadway, would make this alternative infeasible; therefore, no cost estimate was developed.

Build Alternative A2 would construct the WTP near the top of the hill at the Well 2 site (rather than at the base of the hill as proposed in Build Alternative A1) and approximately 6,000 ft of new water main. The Build Alternative A2 site is also in a remote area without nearby residential or commercial uses. However, the site is entirely wooded and has a steep topography, which would require a significant amount of regrading and clearing to establish a level construction site. In addition, a new, 300-ft long driveway would have to be constructed down the hill to meet the existing access drive. The potential routes for the new driveway are limited by steep grades and ledge on the hillside and wetlands adjacent to the existing access drive. Although the WTP would be located well above the 100-year flood elevation, the new driveway would be partially located in the floodplain; as a result, this alternative would have temporary impacts to 23,990 sf of BLSF. In addition, construction of the new driveway would require relocation of an existing hiking trail from the adjacent MassAudubon property to the existing access drive. According to the Single EIR, Build Alternative A2 is not a practicable site for the WTP due to the challenging construction conditions, which result in an estimated cost of \$42.95 million; this is higher than any other alternative.

---

<sup>2</sup> After the close of the comment period on the Single EIR, I received comments recommending that the Town evaluate a No Build Alternative involving a connection to the MWRA system rather than construction of the proposed WTP and water mains. According to the Town, this alternative was discussed by the Selectboard but rejected for several reasons, including its costs. I note that a connection to the MWRA system would have impacts of its own, including an interbasin transfer of water. Accordingly, I do not find it necessary to require further consideration of this No Build Alternative as part of this MEPA review.

Build Alternative B would construct the WTP on the Well 3 site at the end of Farnham Road. The site has several suitable characteristics for construction of a WTP, including a generally flat topography that is located outside of wetland resource areas and the floodplain and compatibility with the Town's use of a nearby site as its composting facility. The site is located within 500 feet of up to six homes on Sandy Ridge Circle, which is located to the south/southwest. Construction of water mains would have no permanent impacts to Riverfront Area and temporarily alter approximately 24,225 sf of Riverfront Area, which is significantly less than the wetlands impacts of the other alternatives. In addition, Build Alternative B would require approximately 12,000 ft of new water mains, including approximately 3,000 ft main to convey water from Well 2; a separate 6,600-ft water main to convey water from Well 4; and 6,600 ft of new main to convey finished water from the WTP to the distribution system. All three new water mains would require a crossing of Beaver Brook, which would increase the cost of this alternative, which is estimated to be approximately \$42.04 million. Finally, Build Alternative B is the only alternative which would require a main carrying finished water to be installed deep under Beaver Brook using HDD; if the finished water main under Beaver Brook were to break or require repair, it would remove all three wells from operation and limit the Town's ability to meet the Town's demand for water.

The Preferred Alternative includes the construction of a new WTP at the Well 4 site. According to the Single EIR, the advantages of the Well 4 site include sufficient land area available to avoid impacts to BLSF and to minimize impacts to Riverfront Area; it requires less earthwork than the Well 2 site; and it minimizes the length of new water mains (5,300 ft) that would need to be installed. However, the preferred site is located within a residential neighborhood with four direct abutters and six or more residences within 500 feet. According to residents of the surrounding neighborhood, the amount of earthwork proposed at the site and the facility, including the retaining wall and fence proposed along the site's Tree Lane frontage, would impact the scenic nature of the neighborhood and generate noise and lighting impacts. The Single EIR described a revised orientation of the WTP which, compared to the design originally described in the EENF/Proposed EIR, shifts the northern end of the facility to the east, away from the neighborhood, and allows for additional plantings between the facility and the neighborhood. Compared to the orientation included in the EENF/Proposed EIR, which was designed to minimize Riverfront Area impacts, the revised orientation of the building increases permanent impacts to the Riverfront Area from 14,735 sf to 23,205 sf and temporary Riverfront Area impacts from 17,660 sf to 40,390 sf. However, the revised orientation was selected as the Preferred Alternative due to the increased buffer provided from residences. According to the Single EIR, the Preferred Alternative would cost \$36.34 million, which is significantly less than any of the other alternatives.

### *Environmental Justice*

The project area is located within one mile of one EJ population in Sharon designated as Minority. Within the census tract containing the above EJ population, no languages are identified as those spoken by 5% or more of residents who also identify as not speaking English very well. In the EENF/Proposed EIR, the Town provided a baseline assessment of any existing "unfair or inequitable Environmental Burden and related public health consequences" impacting the identified EJ population in accordance with 301 CMR 11.07(6)(n)(1) and the MEPA Interim Protocol for Analysis of EJ Impacts. The baseline assessment included a review of the data provided by the Department of Public Health (DPH) EJ Tool applicable to the DGA regarding "vulnerable health EJ criteria"; this term is defined in

the DPH EJ Tool to include any one of four environmentally related health indicators (Childhood Lead Exposure, Childhood Asthma Emergency Department Visits, Low Birth Weight and Heart Attack Hospitalizations) that are measured to be 110% above statewide rates based on a five-year rolling average. As documented in both the EENF/Proposed EIR and Single EIR, neither the Town of Sharon nor Block Group 3, Census Tract 4141, in which the EJ population is located, exceed 110% of the statewide rates of any of the four vulnerable health EJ criteria. According to the Single EIR, the project will not have disproportionate adverse effects on EJ populations because no project activities are proposed within EJ populations, there are minimal air emissions associated with the project, the project will have minimal traffic impacts during the operations and construction periods and stormwater runoff will be managed on-site. The purpose of the project is to protect the public health of all residents served by the drinking water system, which includes residents in EJ populations, by constructing a treatment facility that will ensure that the drinking water from Wells 2, 3 and 4 meets drinking water standards.

Prior to the publication of the EENF/Proposed EIR, the Town sent advance notification of the project in the form of an EJ Screening Form to a “EJ Reference List” provided by the MEPA Office and consisting of Community Based Organizations (CBOs) and tribes/indigenous organizations. Organizations on the EJ Reference List were provided with notice of the MEPA remote and in-person site visits conducted during the EENF/Proposed EIR review period. In addition, the Town posted notices of public meetings at Town Hall, the Sharon Public Library and the Sharon Post Office. Since the Certificate on the EENF/Proposed EIR was issued on July 31, 2023, the project was presented and discussed at public meetings held by Town of Sharon Water Management Advisory Committee and the Select Board, and the project will be the topic of upcoming public hearings to be held by the Sharon Conservation Commission, Sharon Planning Board, and Sharon Board of Zoning Appeals. According to the Single EIR, notices of the meetings were distributed to residents of the neighborhood adjacent to the proposed WTP and organizations on the EJ Reference List, and were posted at Town Hall, the Sharon Public Library and the Sharon Post Office. The Town will continue to use these notification methods to encourage public participation in future meetings during the design, permitting, and construction phases of the project.

#### *Wetlands and Stormwater*

The Single EIR provided a revised design of the section of water main to be installed between Well 3 and Well 2. In the EENF/Proposed EIR, the Town proposed to install most of the water main in a trench and to use HDD to install only the section under Beaver Brook. According to the Single EIR, the entire raw water main will be constructed below wetlands and Beaver Brook using HDD; this change will reduce temporary impacts to Riverfront Area by 6,863 sf and to BLSF by 7,545 sf. The project will comply with all requirements of the Order of Conditions to be issued by the Sharon Conservation Commission minimizing and mitigating impacts to Riverfront Area and BLSF.

The project will add 0.45 acres of impervious area at the proposed WTP site. According to the Single EIR, a new stormwater management system be constructed at the WTP site that will be designed in accordance with the MassDEP Stormwater Management Standards (SMS), including requirements for pollutant removal and peak flow attenuation through the use of Best Management Practices (BMPs) such as deep-sump hooded catch basins, sediment forebays and two infiltration basins with emergency overflow spillways and riprap aprons. As detailed below, the stormwater management system will be designed to accommodate storm events under projected future climate conditions.

### *Climate Change*

The Single EIR reviewed the output report, previously included in the EENF/Proposed EIR, from the MA Resilience Design Tool which assessed the climate risks of the project. Based on the output report, the project has a “High” exposure rating based on the project’s location for extreme heat and riverine and urban flooding due to extreme precipitation. Based on the 30-year useful life and the self-assessed criticality identified for the WTP, the MA Resilience Design Tool recommends a planning horizon of 2050 and a return period associated with a 50-year (2% chance) storm event when designing the WTP. It also recommends planning for the 90th percentile for applicable extreme heat parameters. According to the Single EIR, the WTP is unlikely to experience riverine flooding because its first-floor elevation will be 226 ft NAVD 88, which is over 20 ft higher than the 100-year flood elevation of Beaver Brook. The stormwater management system at the WTP will be designed with the capacity handle the current 100-year storm event having a 24-hour precipitation depth of 9.07 inches, which exceeds the 8.9 inches of precipitation projected for the 2050 50-year storm event. Given the critical nature of the WTP, I encourage the Town to evaluate a stormwater management system design with the capacity to handle an even higher level of increased precipitation associated with more intense storm events anticipated under future climate conditions. According to the Single EIR, the Well Stations will be upgraded with new high-efficiency variable frequency drive pumps and will install electrical equipment within water-tight panels and conduits to provide protection from flooding.

### Mitigation and Draft Section 61 Findings

The Single EIR included an updated chapter that summarized proposed mitigation measures and provided individual draft Section 61 Findings for each Agency that will issue permits for the Project. The draft Section 61 Findings will be revised and finalized during permitting.

### *Environmental Justice*

- The Town will continue to provide notification to residents of public meetings during the design, permitting, and construction phases of the project.

### *Wetlands and Waterways*

- Work within wetland resource areas will be conducted in accordance with the Order of Conditions issued by the Sharon Conservation Commission.
- A stormwater management system, designed consistent with the Massachusetts Stormwater Management Standards, will be constructed at the WTP.
- Minimize impacts to wetland resource areas by constructing water mains within roadways and previously-disturbed areas and by using HDD to install the raw water main from Well 3 under Beaver Brook.
- Restore disturbed Riverfront Area and BLSF to original site grades, and by revegetating disturbed areas.
- Minimize impacts to wetlands and water quality by using sedimentation and erosion controls around work areas and other stormwater management measures required by the Order of Conditions and Storm Water Pollution Prevention Plan (SWPPP) prepared in accordance

with the NPDES General Permit.

### *Adaptation and Resiliency*

- A landscaped buffer will be planted between the WTP and Tree Lane.
- The WTP will be located at an elevation approximately 20 ft higher than the Beaver Brook BFE (204 ft NAVD 88) near the site, which minimizes the potential for riverine flooding of the site under future storm conditions.
- The WTP will be designed to be energy efficient, including a high-efficiency building envelope, an electric air source heat pump (ASHP) to heat and cool the control room/laboratory, reduced light power density and outdoor LED lighting.
- The stormwater management system at the WTP will be designed with the capacity handle the current 100-year storm event with a 24-hour precipitation depth of 9.07 inches, which exceeds the 8.9 inches of precipitation projected for the 2050 50-year storm event.
- Well station upgrades include installation of new pumps with high-efficiency variable frequency drives.
- The Well Stations will be designed to protect electrical equipment by using water-tight panels and conduits and will be constructed with backup generators located in weatherproof enclosures.

### *Construction Period*

- Install and maintain sedimentation and erosion controls around work areas and implement other stormwater management measures in accordance with the SWPPP.
- Minimize dust by implementing dust control measures, such as sweeping streets in work areas, covering dump trucks and sprinkling water or calcium chloride on disturbed areas.
- Minimize air emissions by using an emission control device such as a diesel oxidation catalyst or diesel particulate filter on each piece of diesel construction equipment, using ultra-low sulfur diesel (ULSD) fuel, prohibiting motor vehicle engines from idling more than five minutes, and require that diesel equipment meet EPA's Tier 4 Emissions Standards.
- Develop a traffic management plan to maintain safe roadway conditions for pedestrians, bicyclists and motorists.
- Notify MassDEP if any contaminated soil and groundwater is encountered during construction.
- Manage any contaminated soil and groundwater encountered during construction in accordance with applicable Massachusetts Contingency Plan (MCP) requirements and under the supervision of a Licensed Site Professional (LSP).
- Manage any asbestos cement water mains encountered during construction by storing and disposing of the material in accordance with the Solid Waste Management Regulations (310 CMR 19.00) and Air Quality Regulations (310 CMR 7.00) including requirements for handling and disposal of asbestos.

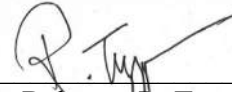

### Conclusion

Based on a review of the Single EIR and consultation with Agencies, I find that the Single EIR adequately and properly complies with MEPA and its implementing regulations. The project may

proceed to permitting. Participating Agencies should forward copies of the final Section 61 Findings to the MEPA Office for publication in accordance with 301 CMR 11.12.

Re: Sharon Wells 2, 3 and 4 Treatment – SEIR comments MEPA #16725

Dear Mr Strysky,

After reviewing the Town of Sharon's Single EIR I am disappointed that the town has produced another document that fails to accurately depict the environmental consequences of each Alternative. I find the document misleading in several ways and feel that clarifying this analysis is important to federal, state, and local boards and agencies in their decision-making process.

I would like to submit the following additional comments on the project MEPA documentation.

1. 1. The Noise Study is incomplete
  - o The sound study required by the MEPA Certificate on the EENF and conducted by the town appears to be incomplete. The study at Well 4 does not model the loss of the earthen hillside that currently buffers the Pine Grove and Tree Lane Neighborhoods from the train noise and vibration nearby. This study should include the impact of loss of hillside as requested (not just the loss of vegetation). Further, it does not model noise from the new treatment plant itself on the abutting homes and, the sound modeling was conducted at the proposed well site, not at the receptors in the neighborhood. Abutters to Well 4 have been told that the facility cannot be turned, as the downslope side creates "too much noise" to turn it toward the neighborhood. It's not clear why this new noise would have been omitted from the study, or why the study did not take noise measurements at the receptor locations.
2. The Cost Analysis is Incomplete
  - o Once the sound study is updated, any costs or additional disturbance that may be needed to mitigate noise impacts to the neighborhood must be part of the alternatives analysis.
  - o Beyond any needed noise mitigation, the \$36 million cited in the document does not include other mitigation costs already committed to by the Select Board during their hearing process. These costs need to be added to the Well 4 project costs as line item and not lumped into the contingency that will inevitably be eroded by other unforeseen costs that inevitably come up during construction.
  - o Without this additional information, the cost comparison in the document is incomplete.
3. The Wetlands impacts discussion and Riverfront Alternative Analysis is incomplete and misleading

- We note that 310 CMR 10.58 requires an alternatives analysis to minimize impacts to Riverfront. We note that Well 3 represents a total avoidance alternative for all jurisdictional wetlands, including Riverfront. The town has indicated that Well 3 is feasible operationally and is constructable (and will in fact have far less site earthwork than other options) Since this site represents an avoidance alternative that meets the purpose and need of the project, 310 CMR 10.58 would require that it be selected as the preferred. The costs that have been left out of Well 4 accounting create a misleading cost comparison between these two alternatives that is relevant to this regulatory process.
  - The description of Well 2 hillside on page 15 describes the permitting as a “significant” regulatory challenge. When in fact this Alternative is less impactful to regulated wetlands than Well 4, which the document describes as “more favorable”. This assessment is factually wrong since Well 4 has the greatest impact of any alternative. This statement is silent on permitting at Well 3 which would be even easier to permit than the other two given it avoids all impacts to buffers, and Riverfront.
  - Well 3 is described as having “regulatory challenges” to crossing Beaver Brook, when in fact an HDD crossing is required of all alternatives, not just Well 3. In fact, the document states elsewhere that HDD was selected because it avoid impacts on the wetlands. So how can the HDD crossing of Beaver Brook “avoid impacts” for Well 4 but create “permitting challenges” for Well 3?
  - The description of each well site and its proximity to homes continues to be misleading as well. Rather than state the *closest* distance to a nearby homes the analysis lumps all homes into two categories: 250 and 500 feet. Conveniently avoiding the actual distance to homes at (which at Well 4 is 70 feet, significantly below the 250-foot arbitrary threshold and three times closer than any other alternative.) This type of analysis obfuscates the actual details that downplay the community impacts. Since proximity to homes was selected by the town as a criterion for the alternatives analysis, it should be more accurately represented and mitigated appropriately with detailed commitments and financial accounting.
4. Statements throughout compare only one alternative to another rather than comparing all three. Comparing Well 4 to Well 2 rather than to both Well 2 and 3 is misleading and factually incorrect – for example:
- “Consequently, obtaining approvals from the Sharon Conservation Commission and DEP would be comparatively less challenging than the Well 2 site.” It appears this is incorrect as the impacts at Well 4 are *greater* than both Well 2 hillside and Well 3 and raises the question as to why this analysis avoids comparing it to Well 3 where permitting would be easiest.

In reviewing the proposed alternative layouts, the preferred alternative as presented would have the greatest environmental harm – placing a chemical treatment plant in a neighborhood with no undisturbed buffer as would be afforded at every other site, creating pathways for additional noise and air pollution from nearby trains due to the loss of the earthen hillslope, placing construction traffic and activity at a high crash site in the center of town, creating greater impacts to riverfront than either of the other alternatives, and resulting in greater impacts to the 100 foot buffer than either of the other sites. This is not clearly stated anywhere in the document. Mitigating the impacts to the Well 4 neighborhood as

promised by the town will undoubtedly add to the cost. Leaving these costs out of the document leads to a misleading conclusion that this site is far less expensive than other alternatives, which is not the case.

Thank you for the opportunity to comment.

Sincerely,

A handwritten signature in blue ink, appearing to read 'Meredith Avery', with a long, sweeping horizontal line extending to the right.

RE: SEIR Review. EOEEA # 16725  
SHARON. Wells 2, 3, 4 Water Treatment at  
15 Tree Lane

Dear Secretary Tepper,

The Southeast Regional Office of the Department of Environmental Protection (MassDEP) has reviewed the Single Environmental Impact Report (SEIR) for the Wells 2, 3, 4 Water Treatment at 15 Tree Lane, Sharon, Massachusetts (EOEEA #16725). The Project Proponent provides the following information for the Project:

**The Project proposes to construct a permanent treatment facility for the removal of iron, manganese, and per- and polyfluoroalkyl Substances (PFAS) from the raw water at Wells 2, 3, and 4. The project includes a new water treatment plant (WTP) located at the existing Well Station 4 site at 15 Tree Lane in Sharon, MA as well as water main work to connect Wells 2, 3, and 4 to the new WTP. The proposed WTP site includes the following:**

- An approximate 7,500 square foot building with a residential façade and slab on grade to house the treatment facility;
- Below grade pipe gallery, finished water wet well, and backwash waste tank;
- Access road and parking;
- Screening from neighboring residences in accordance with the Sharon Zoning Bylaw;
- Plantings and associated landscaping improvements;
- Stormwater infiltration basins, catch basins, and drainage manholes; and,
- Retaining walls to reconcile grade differentials across the site.

Additionally, the project includes approximately 5,800 feet of new water main to connect Wells 2, 3, and 4 to the new WTP facility.

**Since the filing of the Proposed EIR, the following project updates have been made and incorporated into this Single EIR:**

- **WTP Building façade** – The architectural design of the building façade changed from a barn-like façade to a residential façade.
- **WTP Building Site Orientation** – The site layout at the Preferred Well 4 site was updated to include a vegetated buffer between the building and Tree Lane and closed draining system.
- **Well 2 to Well 3 Water Main** - The alignment of the proposed cross country water main changed to be a direct horizontal directional drill from Well 2 to Well 3.
- **Alternatives Analysis** – The Alternatives Analysis has been expanded based on comments submitted on the Proposed EIR as follows:
  - a. The Proponent developed concept level site development plans for two additional sites: the Well 2 and Well 3 sites.
  - b. The concept level site plans helped develop an opinion of probable project cost (OPPC) to supplement the alternatives analysis.
- **Noise Analysis** – The Proponent completed a noise analysis based on comments submitted on the Proposed EIR.
- **Public Outreach** – The Proponent held multiple Town meetings to review and evaluate the project. Public notice of meetings included notification to abutters of all alternative sites under evaluation.

### *Bureau of Water Resources (BWR) Comments*

**Wetlands.** The Proponent is reminded that the Wetlands Notice of Intent, including the stormwater report, shall be submitted to both the Sharon Conservation Commission and MassDEP. The Stormwater

**Drinking Water.** As designed, the new WTP appears to provide drinking water in compliance with the Secondary Maximum Contaminant Levels (MCL) for iron and manganese, the Massachusetts Primary MCL for PFAS6 and the probable new Federal Primary MC for PFAS compounds.

**Underground Injection Control (UIC).** Because at the time of submittal of the SEIR Stormwater Control design plans have not been finalized, the Proponent is reminded that underground infiltration structures may be subject to the jurisdiction of the MassDEP *Underground Injection Control (UIC)* program. These structures must be registered with MassDEP UIC program through the submittal of a BRP WS-06 UIC Registration application through MassDEP’s electronic filing system, eDEP. The statewide UIC program contact is Joe Cerutti, who can be reached at [joseph.cerutti@state.ma.us](mailto:joseph.cerutti@state.ma.us). All information regarding on-line (eDEP) UIC registration applications may be obtained at the following web page under the category “Applications & Forms”: <https://www.mass.gov/underground-injection-control-uic>.

Additional information can be found at: <https://www.mass.gov/how-to/ws-06-registration-of-a-class-v-uic-well-and-modification-of-an-existing-registration>.

### *Bureau of Air and Waste (BAW) Comments*

#### **Air Quality.**

##### *Noise.*

As discussed in the SEIR, “the Proponent is working to retain a natural tree buffer between the proposed WTP and Tree Lane properties to help mitigate potential noise impacts.”

The Project Proponent is advised that the MassDEP noise policy (<https://www.mass.gov/doc/massdep-noise-policy/download>) that applies to the Project establishes a 10 dB(A) increase in sound as the maximum sound impact which cannot be exceeded at the property line or the nearest receptor. Sound increases are evaluated in accordance with the MassDEP Noise

Pollution Policy Interpretation. The Proponent is reminded that the 10 dB(A) is not a design standard but a performance standard. Sound impacts should be mitigated to extent practicable during and after the WTP's construction.

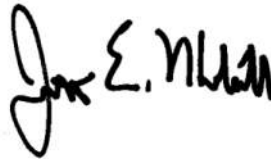

**Solid Waste Management** The Proponent did not commit to source separation at the construction site in the SEIR. MassDEP recommends the Proponent reconsider source separation or separating different recyclable materials at the job site. Source separation may lead to higher recycling rates and lower recycling costs. Further guidance can be found at: <https://recyclingworksma.com/construction-demolitionmaterials-guidance/>

For more information on how to prevent banned materials from entering the waste stream the Proponent should contact the RecyclingWorks in Massachusetts program at (888) 254- 5525 or via email at [info@recyclingworksma.com](mailto:info@recyclingworksma.com) RecyclingWorks in Massachusetts also provides a website that includes a searchable database of recycling service providers, available at <http://www.recyclingworksma.com>.

***Other Comments/Guidance***

The MassDEP Southeast Regional Office appreciates the opportunity to comment on this SEIR. If you have any questions regarding these comments, please contact George Zoto at [George.Zoto@mass.gov](mailto:George.Zoto@mass.gov) or [Jonathan.Hobill@mass.gov](mailto:Jonathan.Hobill@mass.gov).

Very truly yours,

Jonathan E. Hobill,  
Regional Engineer,

**From:** [Paul Lauenstein](#)  
**To:** [Strycky, Alexander \(EEA\)](#)  
**Subject:** comments on Sharon's MEPA application for a PFAS filtration facility  
**Date:** Monday, November 27, 2023 6:32:03 PM  
**Attachments:** [Filtration v MWRA.pdf](#)

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Attached are comments concerning the Town of Sharon's MEPA application to build a PFAS filtration plant.

They include comments about the environmental impact of Sharon's wells, which will continue to impact Sharon's local environment until Sharon switches to MWRA water.

Paul Lauenstein  
4 Gavins Pond Rd.  
Sharon, MA 02067  
781-784-2986

**Sharon's Drinking Water Source:  
Local Wells or MWRA Reservoirs?**

**Four factors to consider:**

- 1. Contamination of drinking water**
- 2. Water hardness**
- 3. Environmental impacts**
- 4. Cost**

My name is Paul Lauenstein. I live at 4 Gavins Pond Rd. By way of disclosure, I served for nine years on Sharon's Water Management Advisory Committee, and I am currently a volunteer member of MWRA's Water Supply Citizens Advisory Committee.

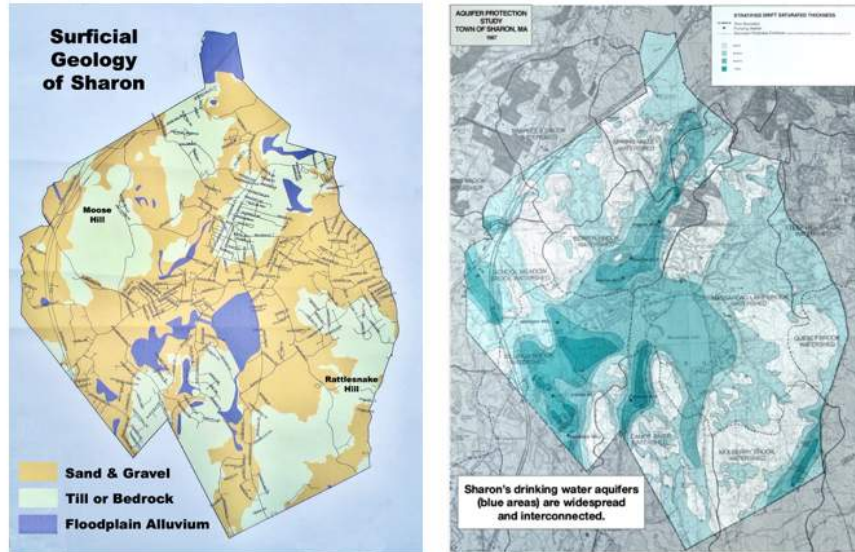

Sharon is facing a choice between building a PFAS filtration plant, or building a pipeline to connect to the MWRA water supply system.

Either option will cost tens of millions of dollars. We cannot afford to do both.

Four factors should be weighed in making this choice:

1. Contamination of drinking water,
2. Hard water vs. soft water,
3. Environmental impacts, and
4. Cost

## 1. Contamination

**Permeable sand & gravel overlies most of Sharon's aquifers.**

First, let's take a look at contamination.

Sharon's municipal drinking water wells tap permeable sand and gravel aquifers. These aquifers get re-charged by rain that percolates down to the aquifers through sand and gravel. Contaminants on the surface dissolve in the rain water, and end up in the aquifers.

**Septic Systems**

**Herbicides & Pesticides  
applied to lawns**

Effluent from approximately 6,000 septic systems constantly adds pharmaceuticals and personal care products to the groundwater.

Homeowners and businesses apply a wide variety of herbicides and pesticides to their lawns, which washes into the ground when it rains.

**Pesticide application at a soccer field near Well #7**

Pesticides were applied to a soccer field in a groundwater protection district near Well #7. When town officials found out, they told those responsible never to do that again, but enforcement is problematic.

**Facility installed behind Shaw's Plaza to remove trichloroethylene (TCE) from the groundwater**

Years ago, trichloroethylene (TCE) from a dry cleaning business at Shaw's Plaza contaminated the groundwater near Well #5. A facility had to be constructed to prevent the TCE from contaminating Well #5, which is only about a quarter mile away. TCE in the groundwater behind Shaw's Plaza continues to be monitored to this day.

Road salt elevates the level of sodium in Sharon's well water, which has approximately double the concentration of sodium found in MWRA water.

**Automotive chemicals stained this garage floor.**

If road salt is getting into Sharon's well water, what other automotive chemicals from Sharon's 100 miles of roadways might be finding their way into our drinking water aquifers?

**WATER QUALITY SUMMARY** Listed below are 19 contaminants detected in Sharon's drinking water in 2021. Not listed are over 100 other contaminants for which we tested but did not detect. The complete list of contaminants that we test for is available at the Department of Public Works office and at the Sharon Public Library.

**SAMPLES COLLECTED FROM OUR WATER SUPPLY**

Substance (Contaminant)	Units	Highest Annual Average	Range of Detection	Maximum Contaminant Level Goal (MCLG)	Maximum Contaminant Level (MCL)	Other State or Federal Action Level	Source of Contaminant
<b>PRIMARY CHEMICALS</b>							
Acetone	ppb	17.9	ND - 17.9	6300	N/A		Discharge from industrial production and use, in automobile exhaust, from landfills and natural sources
Alpha Emitters	pCi/L	10.8	0.1-10.6	15	0		Erosion of natural deposits
Chloroform	ppb	2.1	ND-2.1	70	N/A		By-product of drinking water chlorination
Combined Radium	pCi/L	2.39	0.29-2.39	5	0		Erosion of natural deposits
Fluoride	ppm	0.82	0.63-0.82	4	4		Water additive which promotes strong teeth
Nitrate	ppm	6.30	0.75-6.30	10	10		Runoff from fertilizer use; Leaching from septic tanks
Perchlorate <sup>1</sup>	ppb	0.34	0.07-0.34	2.0	N/A		Oxygen additive in solid fuel propellant for rockets, missiles, and fireworks
PFAS <sup>2</sup>							
Well # - violation (Avg)	ppb	88.8	ND-88.8	20.0	N/A		Discharges and emissions from industrial and manufacturing sources associated with the production or use of these PFAS, including production of moisture and oil-resistant coatings on fabrics and other materials. Additional sources include the use and disposal of products containing these PFAS, such as fire-fighting foams.
All other sources (Avg)	ppb	19.5	ND-19.5	20.0	N/A		
<b>SECONDARY CHEMICAL</b>							
Manganese <sup>3</sup>	ppb	64 (Avg)	9 - 230	NR	NR		Erosion of natural deposits
<b>UNREGULATED CHEMICALS<sup>4</sup></b>							
Bromodichloromethane	ppb	0.8	ND-0.8	NR	NR		By-product of drinking water chlorination
Chlorodibromomethane	ppb	0.7	ND-0.7	NR	NR		By-product of drinking water chlorination
Perfluorobutane sulfonic acid (PFBS)	ppb	0.9	ND-0.3	NR	NR		N/A
Perfluorohexanoic acid (PFHxI)	ppb	1.3	ND-6.1	NR	NR		N/A
Sodium <sup>5</sup>	ppm	82.2	20.1-113	NR	NR		Discharge from the use and improper storage of sodium-containing de-icing compounds or in water softening agents

**Water suppliers are only required to test for a few of the thousands of possible contaminants in drinking water.**

**SAMPLES COLLECTED FROM YOUR FAUCETS**

Substance (Contaminant)	Units	Maximum Contaminant Level Goal (MCLG)	Range of Detection	Maximum Contaminant Level (MCL)	Other State or Federal Action Level	Source of Contaminant
<b>PRIMARY CHEMICALS</b>						
Total Trihalomethanes	ppb	23.9 (DTE 4)	3.3-37.4	80	N/A	By-product of drinking water chlorination
Halacetic Acids (HAA5)	ppb	4.9 (DTE 4)	ND-11	80	N/A	By-product of drinking water chlorination
Chlorine	ppm	0.45	0.07-1.52	ADMCL	ADMCL	Water additive used to control microbes
<b>OTHER</b>						
Copper <sup>6</sup> (if samples exceeded the action level)	ppm	0.16	0 - 0.21	1.3	1.3	Corrosion of household plumbing systems
Lead <sup>7</sup> (if samples exceeded the action level)	ppb	7	0 - 9	15	0	Corrosion of household plumbing systems

Public water suppliers are required to test for a few dozen potential contaminants. The results are posted on the town web site. However, there are thousands of chemicals in the products we use daily. It is simply not feasible to test the drinking water for all of them.

For example, there are more than 5,000 different kinds of PFAS and new ones are being developed all the time, but public water suppliers are only required to test for six of them. Prior to 2021, no PFAS testing was required at all. As a result, Sharon residents including infants and pregnant women were exposed to PFAS.

The Quabbin Reservoir, which provides most of MWRA's water, is surrounded by mostly uninhabited forest, which naturally filters and purifies the water. The MWRA is one of the few major water supplies in the United States where filtration is not required by the EPA.

## 2. Water Hardness

**Mineral deposits in toilet bowls are evidence of Sharon's hard water.**

Second, let's take a look at water hardness.

Groundwater from Sharon's wells is "hard" meaning it is high in dissolved minerals.

Hard water reduces the effectiveness of detergents, so clothes and dishes do not get as clean.

Hard water is not good for skin and hair.

Hard water leads to more frequent replacement of water heaters and washing machines.

				<b>Total</b>	<b>\$8,471.10</b>

**Notes**

We recommend the water softener in your home due to the level of hardness detected in your water. Water that is hard will leave a residue on fixtures, sinks, tubs, appliances, etc. This residue over time will cause premature failure of appliances and fixtures, leading to costly repairs. In some cases hard water can cause skin to be dry and irritated as well as drying out hair. This unit will eliminate those issues you are experiencing by dramatically reducing hardness causing minerals in your water. It will also reduce iron therefore preventing iron staining and damage. The maintenance on this unit is keeping salt in the brine tank. Typically, brines will fill up the brine tank every 9-12 months. The cost of each fill up is around \$100.

We recommend the Carbon filter to remove contaminants from the town water. The carbon filter would help improve the taste, smell, and clarity of the water. The maintenance on the carbon unit is every 5 years. It requires a resin re-bed. We remove the old media and replace it with new media. The cost of this service is about \$550.

The AC30 Reverse Osmosis system, is a point of use unit used for drinking water purposes. This unit will dramatically reduce impurities in your drinking water such as sodium, fluoride, chlorine, copper, etc. These filters are changed every year for a cost of approximately \$295. There is a membrane on the unit that gets changed about every 4-6 years, based off our water test, and that is an additional \$195.

**Terms**

The whole system, top to bottom, comes with a one-year warranty. If anything needs to be fixed or replaced on the units in the first year it will be at no charge to you. The HE circuit boards, control valve bodies and brine tank have a 10-year warranty. The Quadra-hull softener tank and carbon tank have a lifetime warranty.

For the AC30, the faucet, tank, and manifold have a lifetime warranty. The filters, O-rings and tubing have a one-year leak guarantee from when they are changed by a Culligan technician.

Along with the warranty you have a 100% satisfaction guarantee on this system for the first 30 days. If you are not satisfied within the first 30 days, we will remove the system and give you a full equipment refund.

Upon completion of the work payment is due. We accept cash, check, and credit cards. For projects over \$10,000, a 25% deposit is required.

All quotes are good for 30 days.

Signatures

**Water softening systems are expensive.**

**This one cost \$8,500, not including ongoing operating and maintenance costs.**

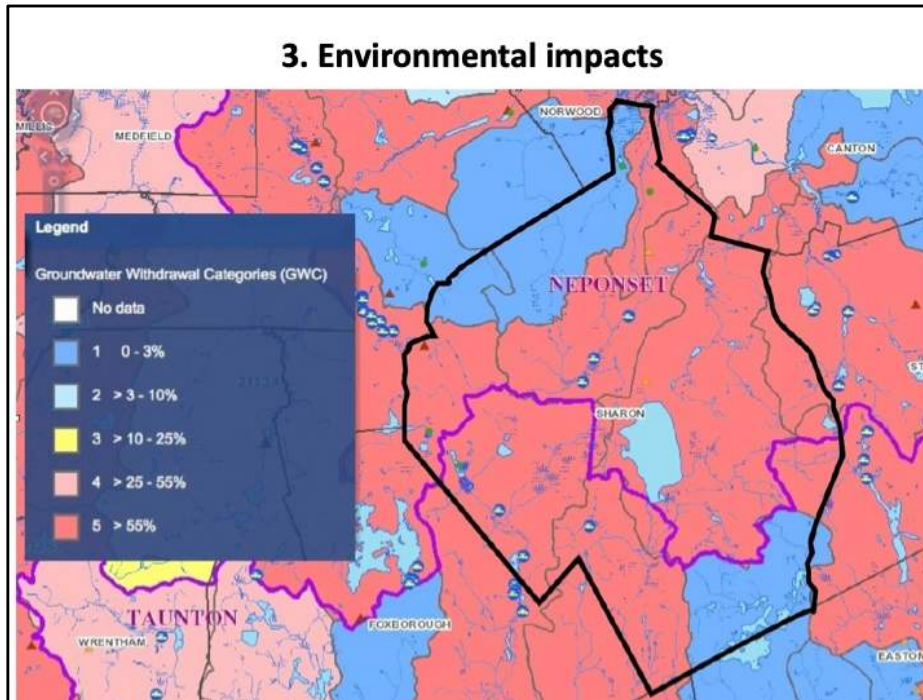

Water softening systems are expensive.

This one, installed recently in a Sharon home, cost almost \$8,500, not including operating and maintenance costs.

It would cost \$50 million dollars to install water softening systems like this one in every home in Sharon.

Surface water from MWRA's reservoirs is naturally "soft," meaning it is low in dissolved minerals.

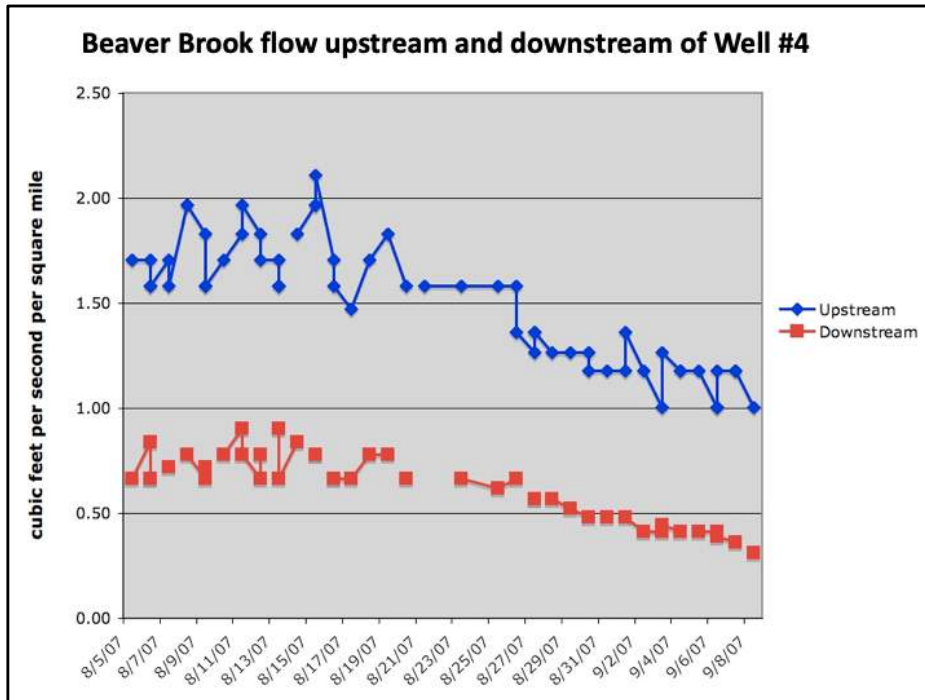

### 3. Environmental impacts

Third, let's take a look at environmental impacts.

Areas shown in red on this map of Sharon are classified by the state as Groundwater Withdrawal Level 5, meaning most of Sharon's environment is maximally impacted by pumping of municipal wells, which appear as blue dots on the map.

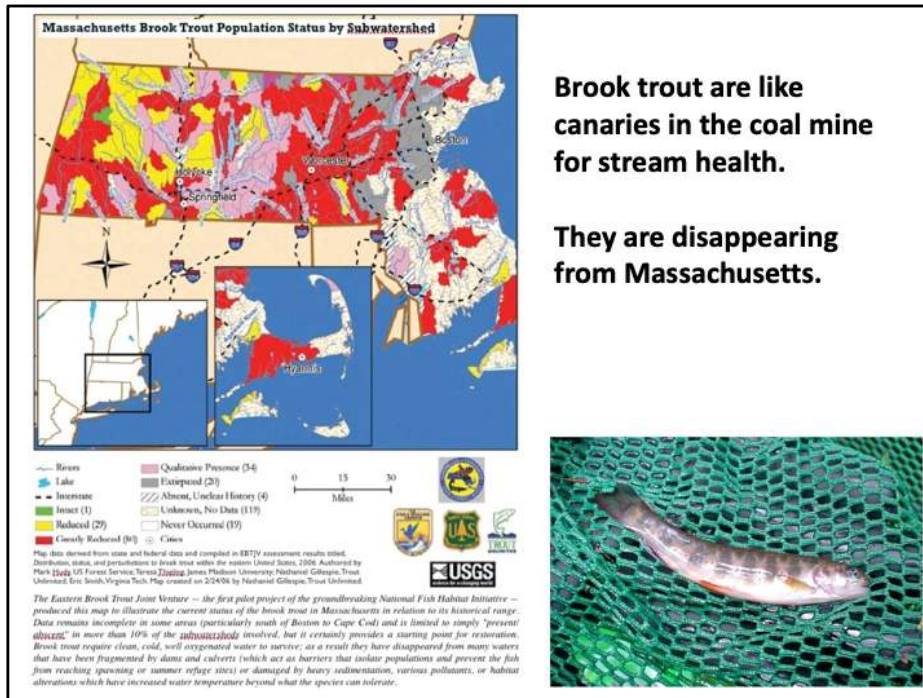

Well #4, located beside Beaver Brook, pumps up to a million gallons per day.

Streams and rivers normally gain flow as they flow downstream. However, the flow in Beaver Brook downstream of Well #4, shown in red, can be lower than flow upstream of the well, shown in blue, due to amount of water withdrawn by the well.

The impact of well pumping is most acute during hot, dry summer weather when aquatic ecosystems are most stressed.

**Brook trout are like canaries in the coal mine for stream health.**

**They are disappearing from Massachusetts.**

Brook trout are like canaries in the coal mine for stream health.

They have disappeared from the areas shown in gray on the map, and they are greatly reduced in the areas shown in red.

When the Massachusetts Division of Fisheries and Wildlife sampled fish populations in Beaver Brook they only found brook trout upstream of the wells.

**Town Meeting resolution passed in 2019**

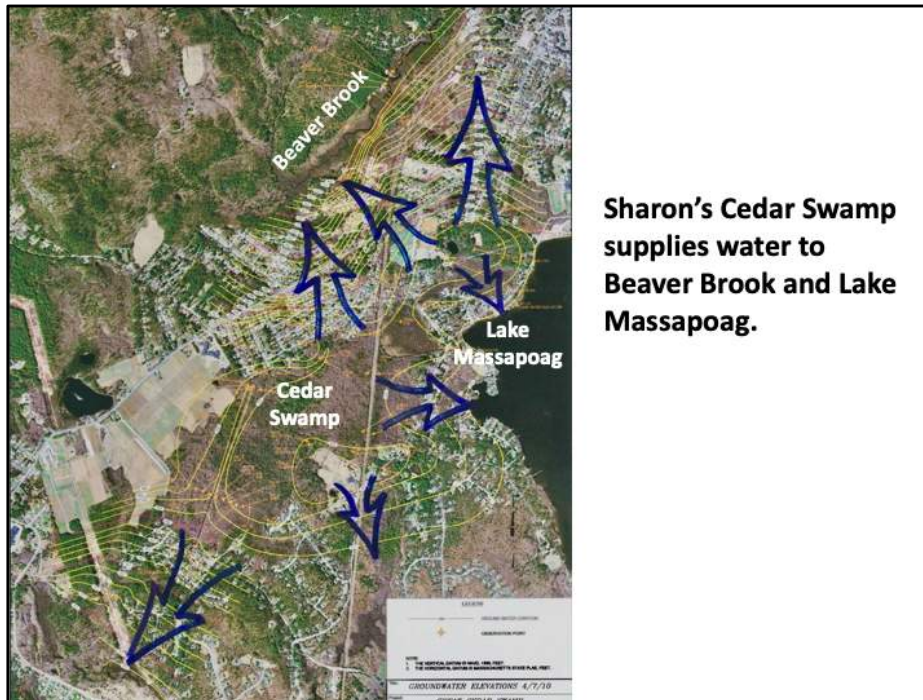

**BE IT FURTHER RESOLVED that the Town of Sharon adopt a goal of reducing greenhouse gas emissions to zero by 2050, and move as quickly as possible to achieve that goal.**

In 2019, Sharon Town Meeting adopted a goal of zero emissions by 2050. As part of that resolution, town officials and staff were asked to consider greenhouse gas emissions as part of the municipal decision-making process.

A filtration plant requires energy to operate, and would increase Sharon's greenhouse gas emissions.

MWRA has reduced its greenhouse gas emissions by approximately 40% since 2006.

Organic peat up to 12 feet deep has been accumulating in Sharon's 250-acre Atlantic White Cedar Swamp for thousands of years. The peat absorbs rain water like a gigantic sponge and gradually releases it to feed Beaver Brook and the underwater springs that feed Lake Massapoag.

When properly hydrated, wetlands like the Cedar Swamp can sequester carbon four times faster than upland forest.

When the water table drops, the carbon sequestration process is reversed. Bacteria oxidize the organic matter, which is released to the atmosphere as carbon dioxide.

By lowering the water table, municipal well pumping has contributed to the loss of up to three feet of organic peat from Cedar Swamp, exposing the roots of this cedar tree, toppling others, and releasing carbon dioxide.

#### **4. Cost**

**The Finance Committee's analysis shows MWRA water would be more expensive, but:**

- **Hidden costs of hard water were not considered.**
- **The treatment plant would only treat 3 of our 6 wells.**
- **Our wells are old, and will require renovation.**
- **Ongoing costs can be controlled through conservation.**

Finally, let's take a look at cost.

The Finance Committee's analysis shows MWRA water would be more expensive, but:

- The hidden costs of hard water were not considered.
- The proposed \$37 million dollar treatment plant would only treat three of our six wells.
- Our wells average 52 years of age. They will eventually have to be renovated at considerable expense.
- Ongoing costs can be controlled through water conservation.

**Only the three wells shown in green are included.**

Date	PFAS6 Concentration (nanograms per liter)					
	Well 2	Well 3	Well 4	Well 5	Well 6	Well 7
4/6/21	19.5	6.2	Not Used	0.0	2.2	8.6
5/4/21	19.8	5.9	Not Used		9.2	4.3
6/7/21	34		Not Used			0
6/21/21	Not Used		ND			
6/23/21	Not Used		ND			0
7/14/21	Not Used	13.1	ND	NS	10.0	5.7
8/12/21	Not Used	10.2	ND	0.0	9.1	5.4
9/16/21	Not Used	13.1	ND	0.0	15.1	7.1
10/13/21	Not Used	Not Used	ND	NS	17.2	6.8
11/18/21	Not Used	Not Used	ND	NS	Not Used	6.0
12/16/21	Not Used	Not Used	ND	NS	Not Used	6.0

ND – None Detected

NS – No Sample Required due to prior 0.0 nanograms per liter results

When Well #4 had to be shut down due to PFAS, all five of the other wells were used to keep Sharon supplied with water.

The proposed filtration plant would only treat the three municipal wells along Beaver Brook, shown in green.

Of the other three municipal wells, two tested positive for PFAS at higher levels than new EPA rules would allow.

The cost to provide PFAS treatment facilities at the two contaminated wells shown in red is not included in the \$37 million in the warrant article, and the cost to operate and maintain these additional facilities was not included in the Finance Committee’s cost analysis.

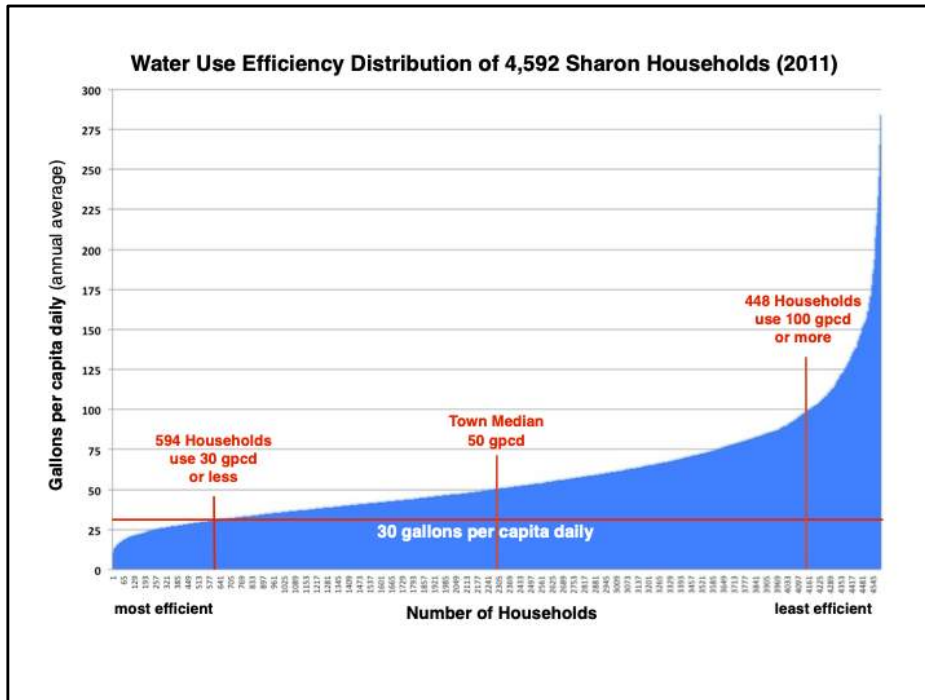

### Sharon's aging wells

Well No.	#2	#3	#4	#5	#6	#7
Year built	1979	1954	1959	1972	1976	1989
Age	44	69	64	51	47	34

**The average age of Sharon's six wells is 52 years.**

Sharon's wells are aging. They will eventually have to be renovated at considerable expense unless we switch to MWRA.

The amount of water used by households in Sharon varies from less than 30 gallons per person per day to more than 100 gallons per person per day.

If every Sharon household were to use water as efficiently as the most water-efficient 600 homes in Sharon, town-wide water use could be cut almost in half. That would greatly reduce the cost of importing MWRA water.

Every homeowner can control their own water bills by controlling their household water use. The Sharon Water Department helps by providing rebates for water-efficient toilets and washing machines.

### **Conclusion**

**The peace of mind of reliably safe, naturally soft MWRA water is worth the cost, especially considering the ability of every household to control their own cost of water through conservation.**

**We should have an opportunity to vote for MWRA water at a future Town Meeting.**

**Please vote NO on Article 1.**

The peace of mind of reliably safe, naturally soft MWRA water is worth the cost, especially considering the ability of every household to control their own cost of water through conservation.

So if you would like an opportunity to vote for MWRA water at a future Town Meeting, please vote NO on Article 1 tonight.

RE MEPA file # 16725 Wells 2, 3 and 4 Treatment in Sharon MA

Dear Mr. Strysky,

I am a resident of Sharon, and just learned about the MEPA process today.

While our Town's water department has been considering solutions for the new EPA PFAS guidelines for years, they have proceeded, to my knowledge, without seriously considering the MWRA option. They also have not informed residents about the MWRA option. At an earlier meeting of the Water Management Advisory Committee where this topic was under discussion, I and other residents were not allowed to comment or ask questions. And my subsequent question to the DPW about the MWRA option went unanswered.

Just recently, in the 11<sup>th</sup> hour, I learned about the planned location for a local water treatment facility, and the MEPA process.

In the MEPA filing they describe the No-Build Alternative (Section 4.1.1): "is not considered a viable option for the Project Site". That statement is non-sensical. The No Build option is clearly an alternative if we consider switching to MWRA water as an option to the issue at hand i.e. the new EPA PFAS guidelines and protecting the health of residents.

I am requesting, and will request through the town, that the residents of Sharon be provided with an environmental impact analysis that compares the MWRA vs. local PFAS treatment facility options.

I am also requesting that the residents of Sharon learn the true cost of joining the MWRA as our water provider. While the Town has hired professional consults to provide the cost estimates of several locations for a local PFAS treatment facility, they are comparing those numbers to in-house DPW-generated estimates of the cost of joining the MWRA. We need non-biased professionals to learn the estimated cost of joining the MWRA, an environmentally friendly option, which can then be compared to the cost of a local PFAS treatment plant with environmental impacts.

Thank you for taking the time to hear my concerns.

Sincerely,

Debbie Tatro, PhD  
10 Sturges Rd.  
Sharon, MA. 02067

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Hello Alexander,

I am writing to comment on the above referenced project. Recognizing that this comment is arriving late I will keep it brief.

We would urge the Secretary to require that the applicant submit a Supplemental EIR to incorporate an additional alternative that has been conspicuously omitted from the analysis, specifically a year round or seasonal connection to the MWRA water system.

Although this alternative has been omitted from the analysis, it has been actively discussed within the town and the town has gone so far as to develop a cost estimate for this alternative. The town already has a physical connection to the MWRA system which is presently only authorized for emergency use. Further it appears that the cost of the MWRA alternative is similar to the cost of the preferred alternative or perhaps less expensive when external subsidies are excluded. The MWRA alternative also comes with significantly fewer environmental impacts as summarized below.

All the alternatives described in the EIR involve permanent and temporary construction impacts to wetlands, many if not all of which could be avoided with the MWRA alternative.

Perhaps more importantly, the existing local water withdrawals associated with wells 2, 3 and 4 have a very significant negative impact on streamflow, aquatic life and wetlands in an extensive watershed area downstream.

Beaver Brook where the water withdrawals are located is classified by MassDEP as a groundwater category 5 stream, MassDEP's most severely impacted category which indicates that healthy native aquatic life communities can not be sustained.

In fact MassDEP finds that Beaver Brook has an August groundwater depletion level of 200%+ and a net groundwater depletion level of 178%. These depletion levels are among the highest, if not the highest, found anywhere in the Neponset River Watershed.

Site specific studies of the Beaver Brook Watershed conducted by MassDEP and MA DFG confirm that native fluvial fish species including cold water species are present in a small section of brook upstream of the wells, but absent downstream of the wells in spite of the availability of high quality riparian habitat in the downstream area. A finding which is fully consistent with the MassDEP groundwater category classification.

The Town of Sharon should be lauded for its effective efforts at conserving water which have slightly reduced the magnitude of these withdrawal impacts, but in order to restore Beaver Brook to a healthy state, it will still be necessary to further reduce withdrawals far beyond the savings that could be achieved through even the most aggressive water conservation efforts.

The only feasible means to achieve such a reduction would be to import water from the MWRA on at least a seasonal basis. In practice the preferred alternative will make impacts to Beaver Brook worse, because none of Sharon's water sources outside the Beaver Brook sub watershed will be furnished with needed treatment plants, thus making the Town even more dependent on the already overstressed Beaver Brook.

The MWRA option would also come with a number of other environmental, reliability, climate resilience, drought resilience, and water quality / public health benefits to the town, at what appears to be a similar overall cost and potentially with lower greenhouse gas emissions.

Given the the substantial benefits and reasonable cost associated with the MWRA alternative, and the fact that this alternative has been evaluated in other fora but has been actively and entirely omitted from the list of alternatives evaluated through the MEPA process, we urge the Secretary to require a supplemental EIR that incorporates this alternative in its analysis.

Thank you for your consideration.

# SECTION 2 SITE EVALUATION, ASSESSMENT, AND PLANNING

## Section 2.1 PROJECT/SITE INFORMATION

### Project Name and Address

Project/Site Name: Wells 2, 3 and 4 Water Treatment Plant

Street/Location: 15 Tree Lane

City: Sharon

State: Massachusetts

ZIP Code: 02067

County or Similar Government Division: Norfolk

### Project Latitude/Longitude

Latitude: 42.073635 ° N

(decimal degrees)

Longitude: 71.110492 ° W

(decimal degrees)

Latitude/longitude data source:  Map  GPS  Other (please specify): Google Earth

Horizontal Reference Datum:  NAD 27  NAD 83  WGS 84

### Additional Site Information

Is your site located on Indian country lands, or on a property of religious or cultural significance to an Indian Tribe?  Yes  No

## Section 2.2 DISCHARGE INFORMATION

Does your project/site discharge stormwater into a Municipal Separate Storm Sewer System (MS4)?

Yes  No

Are there any waters of the U.S. within 50 feet of your project's earth disturbances?

Yes  No

**Table 1: Discharge Receiving Waters**

Point of Discharge ID	Name of receiving water that receives stormwater discharge:	Is the receiving water impaired (on the CWA 303(d) list)?	If yes, list the pollutants that are causing the impairment:	Has a TMDL been completed for this receiving waterbody?	If yes, list TMDL Name and ID:	Pollutant(s) for which there is a TMDL:	Is this receiving water designated as a Tier 2, Tier 2.5, or Tier 3 water?	If yes, specify which Tier (2, 2.5, or 3)?
[001]	Beaver Brook	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	NA	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	NA	NA	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	NA

## Section 2.3 NATURE OF CONSTRUCTION ACTIVITIES

### General Description of Project

The proposed project includes constructing a new water treatment plant building with associated landscape, access road, parking, utility, and stormwater improvements.

Business days and hours for the project: Monday – Friday

### Size of Construction Site

Size of Property	7.6 acres
Total Area Expected to be Disturbed by Construction Activities	1.07 acres
Maximum Area Expected to be Disturbed at Any One Time, Including On-site and Off-site Construction Support Areas	1.07 acres

### Type of Construction Site *(check all that apply):*

Single-Family Residential   
  Multi-Family Residential   
  Commercial   
  Industrial  
 Institutional   
  Highway or Road   
 Utility   
 Other \_\_\_\_\_

Will you be discharging dewatering water from your site?                       Yes     No

If yes, will you be discharging dewatering water from a current or former Federal or State remediation site?                       Yes     No

### Pollutant-Generating Activities

List and describe all pollutant-generating activities and indicate for each activity the associated pollutants or pollutant constituents that could be discharged in stormwater from your construction site. Take into account where potential spills and leaks could occur that contribute pollutants to stormwater discharges, and any known hazardous or toxic substances, such as PCBs and asbestos, that will be disturbed during construction.

Pollutant generating activities will be consistent with general land development projects. This includes the demolition of an existing buildings on site, disturbance of wooded areas, installation of utilities and stormwater management systems, construction of a 7,500 sf Water Treatment Plant building, construction of new parking areas and site driveways, and general landscaping.

<b>Pollutant-Generating Activity</b> (e.g., paving operations; concrete, paint, and stucco washout and waste disposal; solid waste storage and disposal; and dewatering operations)	<b>Pollutants or Pollutant Constituents</b> (e.g., sediment, fertilizers, pesticides, paints, caulks, sealants, fluorescent light ballasts, contaminated substrates, solvents, fuels)
Paving Operations	Fuels, paints

<b>Pollutant-Generating Activity</b> (e.g., paving operations; concrete, paint, and stucco washout and waste disposal; solid waste storage and disposal; and dewatering operations)	<b>Pollutants or Pollutant Constituents</b> (e.g., sediment, fertilizers, pesticides, paints, caulks, sealants, fluorescent light ballasts, contaminated substrates, solvents, fuels)
Construction Sediment	Sediment
Construction Debris	Sediment, fuels

**Construction Support Activities**

Describe any construction support activities for the project (e.g., concrete or asphalt batch plants, equipment staging yards, material storage areas, excavated material disposal areas, borrow areas):

There will be very limited storage of construction supplies and materials on-site.

**Contact Information for Construction Support Activities**

Contact information for construction support activities will be identified after project is bid for construction.

## Section 2.4 SEQUENCE OF ESTIMATED DATES OF CONSTRUCTION ACTIVITIES

Estimated Schedule

Estimated Start Date of Construction Activities for this Phase	Summer 2024
Estimated End Date of Construction Activities for this Phase	Fall 2026
Estimated Date(s) of Application of Stabilization Measures for Areas of the Site Required to be Stabilized	Summer 2024
Estimated Date(s) when Stormwater Controls will be Removed	Fall 2026

## Section 2.5 AUTHORIZED NON-STORMWATER DISCHARGES

### List of Authorized Non-Stormwater Discharges Present at the Site

Authorized Non-Stormwater Discharge	Will or May Occur at Your Site?
Discharges from emergency fire-fighting activities	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Fire hydrant flushing	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Landscape irrigation	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Water used to wash vehicles and equipment	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Water used to control dust	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Potable water including uncontaminated water line flushing	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
External building washdown (soaps/solvents are not used and external surfaces do not contain hazardous substances)	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Pavement wash waters	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Uncontaminated air conditioning or compressor condensate	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Uncontaminated, non-turbid discharges of ground water or spring water	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Foundation or footing drains	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
Uncontaminated construction dewatering water	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No

## Section 2.6 SITE MAPS

Project Design Drawings are included in Appendix A of this report.

# SECTION 3 DOCUMENTATION OF COMPLIANCE WITH OTHER FEDERAL REQUIREMENTS

## Section 3.1 ENDANGERED SPECIES PROTECTION

This project is eligible for coverage under Criterion C under this permit.

- Criterion C:** Discharges not likely to result in any short- or long-term adverse effects to ESA-listed species and/or designates critical habitats. ESA-listed species and/or designated critical habitat(s) under the jurisdiction of the USFWS and/or NMFS are likely to occur in or near your site's "action area," and you certify to EPA that your site's discharges and discharge-related activities are not likely to result in any short- or long-term adverse effects to ESA-listed threatened or endangered species and/or designated critical habitat. This certification may include consideration of any stormwater controls and/or management practices you will adopt to ensure that your discharges and discharge-related activities are not likely to result in any short- or long-term adverse effects to ESA-listed species and/or designated critical habitat. To certify your eligibility under this criterion, indicate 1) the ESA-listed species and/or designated habitat located in your "action area" using the process outlined in Appendix D of this permit; 2) the distance between the site and the listed species and/or designated critical habitat in the action area (in miles); and 3) a rationale describing specifically how short- or long-term adverse effects to ESA-listed species will be avoided from the discharges and discharge-related activities. (Note: You must include a copy of your site map from your SWPPP showing the upland and in-water extent of your "action area" with your NOI.)
- Check to confirm you have provided documentation in your SWPPP as required by CGP Appendix D.

Refer to the US Fish and Wildlife Service report and justification for the Criterion C classification in the attached Appendix K.

## Section 3.2 HISTORIC PROPERTY SCREENING PROCESS

**Instructions (see CGP Part 1.1.6, 7.2.9.b, Appendix E, and the "Historic Preservation" section of the Appendix H – NOI Form and Instructions):**

Follow the screening process in Appendix E of the permit to determine whether your installation of subsurface earth-disturbing stormwater controls will have an effect on historic properties.

- Include documentation supporting your determination of eligibility.
- To contact your applicable State historic preservation office, information is available at <https://ncshpo.org/directory/>
- To contact your applicable Tribal historic preservation office, information is available at [https://grantsdev.cr.nps.gov/THPO\\_Review/index.cfm](https://grantsdev.cr.nps.gov/THPO_Review/index.cfm)

### Appendix E, Step 1

- Do you plan on installing any stormwater controls that require subsurface earth disturbance, including, but not limited to, any of the following stormwater controls at your site? Check all that apply below, and proceed to Appendix E, Step 2.
- Dike
- Berm
- Catch Basin
- Pond
- Constructed Site Drainage Feature (e.g., ditch, trench, perimeter drain, swale, etc.)
- Culvert
- Channel
- Other type of ground-disturbing stormwater control: Infiltration Basins, Drain manhole, Proprietary stormwater treatment units

### Appendix E, Step 2

- If you answered yes in Step 1, have prior professional cultural resource surveys or other evaluations determined that historic properties do not exist, or have prior disturbances at the site have precluded the existence of historic properties?  YES  NO

The project has received negative determination from the Massachusetts Historical Commission (MHC) stating that the project is unlikely to affect significant historic or archaeological resources. The notification has been included in the attached Appendix L.

## Section 3.3 SAFE DRINKING WATER ACT UNDERGROUND INJECTION CONTROL REQUIREMENTS

### Instructions (see CGP Part 7.2.9.c):

- If you will use any of the identified controls in this section, document any contact you have had with the applicable State agency or EPA Regional Office responsible for implementing the requirements for underground injection wells in the Safe Drinking Water Act and EPA's implementing regulations at 40 CFR Parts 144-147.
- For State UIC program contacts, refer to the following EPA website:  
<https://www.epa.gov/uic>.

Do you plan to install any of the following controls? Check all that apply below.

- Infiltration trenches (if stormwater is directed to any bored, drilled, driven shaft or dug hole that is deeper than its widest surface dimension, or has a subsurface fluid distribution system)
- Commercially manufactured pre-cast or pre-built proprietary subsurface detention vaults, chambers, or other devices designed to capture and infiltrate stormwater flow

- Drywells, seepage pits, or improved sinkholes (if stormwater is directed to any bored, drilled, driven shaft or dug hole that is deeper than its widest surface dimension, or has a subsurface fluid distribution system)

# SECTION 4 EROSION AND SEDIMENT CONTROLS AND DEWATERING PRACTICES

**General Instructions (See CGP Parts 2.2 and 7.2.6):**

- Describe the erosion and sediment controls that will be implemented at your site to meet the requirements of CGP Part 2.2.
- Describe any applicable stormwater control design specifications (including references to any manufacturer specifications and/or erosion and sediment control manuals/ordinances relied upon).
- Describe any routine stormwater control maintenance specifications.
- Describe the projected schedule for stormwater control installation/implementation.

Erosion and sediment controls that will be implemented at the site include stabilized construction exit, perimeter siltation control with filter sock, additional siltation control with silt fence, loaming and seeding, inlet control placed in catch basins, and the other features as mentioned below. Please refer to the project's Operation and Maintenance manual for maintenance protocols relative to the proprietary stormwater devices on-site.

## Section 4.1 NATURAL BUFFERS OR EQUIVALENT SEDIMENT CONTROLS

**Buffer Compliance Alternatives**

Are there any receiving waters within 50 feet of your project's earth disturbances?  YES  NO

(Note: If no, no further documentation is required for Section 4.1 in the SWPPP Template. Continue to Section 4.2.)

Check the compliance alternative that you have chosen:

- No natural buffer exists due to preexisting development disturbances (e.g., structures, impervious surfaces) that occurred prior to the initiation of planning for this project.

Project Design Drawings are included in Appendix A of this report which demonstrates compliance with this alternative.

## Section 4.2 PERIMETER CONTROLS

Sediment controls that will be installed downhill of this project site during construction include filter socks and silt fence along with the silt sacks at the catch basins on Tree Lane.

The contractor will install sediment control barriers along the perimeter of the site prior to land disturbance as shown on the Project Design Drawings included in Appendix A. Additional control barriers shall be installed as required to control runoff from the site. If intense rainfall is predicted before all tributary areas are stabilized, erosion control measures will be reinforced for the duration of the storm. All trenches will be backfilled as soon as possible.

**Specific Perimeter Controls**

<b>Sediment Control Barrier</b>	
<b>Description:</b> Sediment control barriers will be siltation fencing in addition to filter sock	
<b>Installation</b>	Sediment control barriers will be installed prior to the start of land clearing in the locations shown on the Project Drawings. These barriers will remain in place until all tributary surfaces have been fully stabilized. Refer to the Erosion Control Detail Sheet CD-1 in Appendix A for the perimeter controls construction details—sediment control barriers shall be anchored adequately into the ground surface and barriers shall overlap sufficiently (not placed side-by-side) to block passage of sediment.
<b>Maintenance Requirements</b>	<ul style="list-style-type: none"> <li>• Sediment captured by perimeter controls shall be checked twice each month and after each heavy rain. Silt shall be removed prior to accumulation to one half of the above-ground height of the barrier (minimum of 6 in).</li> <li>• Condition of sediment control device shall be checked twice each month or more frequently as required. Damaged and/or deteriorated items shall be replaced. Sediment control devices shall be maintained in place and in effective condition.</li> </ul>

Section 4.3 SEDIMENT TRACK-OUT

<p><b>Instructions (see CGP Parts 2.2.4 and 7.2.6.b.iii):</b></p> <ul style="list-style-type: none"> <li>– Describe stormwater controls that will be used to minimize sediment track-out.</li> <li>– Describe location(s) of vehicle exit(s), procedures to remove accumulated sediment off-site (e.g., vehicle tracking), and stabilization practices (e.g., stone pads or wash racks or both) to minimize off-site vehicle tracking of sediment. Also include the design, installation, and maintenance specifications for each control.</li> </ul>
---

The contractor will install, inspect and maintain a stabilized construction exit for the duration of the project to minimize sediment tracking onto impervious surfaces and public ways. Sweeping shall be completed at the end of each working day to minimize sediment track out. The contractor shall inspect the public roadways adjacent to the construction entrance at least twice a day to ensure sediment track out is controlled, and undertake efforts consistent with this SWPPP and local regulations to ensure that any accumulated sediment on public roadways is removed.

**Specific Track-Out Controls**

<b>Stabilized Construction Exit(s)</b>	
<b>Description:</b> The stabilized construction exit will be constructed of coarse stone aggregate on top of a fabric layer.	
<b>Installation</b>	The construction exit will be installed at the beginning of the project in the location indicated on the Site Plans and will remain in place for the duration of the project.
<b>Maintenance Requirements</b>	<ul style="list-style-type: none"> <li>• Conditions at the exit from the site shall be inspected, at a minimum of, at the start and finish of each workday. Any sediment tracks or accumulation shall be cleaned by means of sweeping, vacuuming, or brushing/shoveling. Hosing or sweeping of sediment into stormwater conveyance infrastructure not intended for sediment control is prohibited.</li> <li>• Entrance shall be top dressed with new stone as required to maintain effectiveness. Additional locations may also be considered if sediment tracking becomes an issue.</li> </ul>
<b>Design Specifications</b>	See Construction Detail CD-1 Plans.

**Section 4.4 STOCKPILES OR LAND CLEARING DEBRIS PILES COMPRISED OF SEDIMENT OR SOIL**

The contractor shall store materials and equipment off-site and away from the close proximity of the wetland resource areas. Inclusion of any additional perimeter protection shall be considered if need arises for the additional sediment control measures due to stock piles.

<b>Perimeter Protection</b>	
<b>Description:</b> Sediment control barriers will be a filter sock barrier. Control barriers shall be installed at the base of all stockpiles. All stockpiles shall be within the limit of work. In advance of significant rainstorms, considerations for additional protection, including covering the piles, shall be made. Material stockpiles shall be located to minimize potential for runoff impacts, generally away from the surface waters and drainage inlets.	
<b>Installation</b>	Sediment control barriers for stockpiles will be installed once stockpiling of materials begins.
<b>Maintenance Requirements</b>	<ul style="list-style-type: none"> <li>• Watch for erosion along the pile and regrade/compact to prevent further erosion; cleanup any sediment that travels down the pile.</li> <li>• Any piles that will be unused for 14 or more days will be covered or an appropriate temporary stabilization will be provided.</li> <li>• The contractor is prohibited from hosing down or sweeping soil or sediment accumulated on pavement or other impervious surfaces into any stormwater conveyance, storm drain inlet, or water of the U.S.</li> </ul>

## Section 4.5 MINIMIZE DUST

The contractor shall take steps to minimize the amount of dust created by construction activities. Dust control should be undertaken on an as-needed basis, especially when unstabilized surfaces are present. The contractor shall expect dust conditions to be worse during summer months or periods of extended dry weather.

### **Specific Dust Controls**

<b>Water Controls</b>	
<b>Description:</b> Contractor shall use on-site water or water trucks to control dust on-site.	
<b>Installation</b>	As necessary.
<b>Maintenance Requirements</b>	N/A

## Section 4.6 MINIMIZE STEEP SLOPE DISTURBANCES

The contractor shall minimize the amount of time any disturbed steep slopes are left un-stabilized and should be aware of any weather conditions that may increase the chances of slope wash-out and take necessary precautions to prevent this condition.

### **Specific Steep Slope Controls**

<b>Hydroseed</b>	
<b>Description:</b> Contractor shall hydroseed slopes with general seed mix to stabilize the slopes.	
<b>Installation</b>	Hydroseeding shall be completed within 7 days of final topsoil placement.
<b>Maintenance Requirements</b>	Watch for erosion of soils below and compact and re-hydroseed as needed to continue towards full stabilization and establishment of vegetative materials.

## Section 4.7 TOPSOIL

The project includes the conversion of existing wooded areas into impervious area via building construction and construction of asphalt throughout the site. In these areas, the topsoil must be removed to its full depth to allow for the import of the base materials for the finished surfaces. In the areas of proposed infiltrative stormwater features, any topsoil must be removed to a depth sufficient to remove all unsuitable fill material and replaced with appropriate soil media. The intent is to keep as much topsoil on-site; however, it is likely that excess topsoil will be generated and will have to be removed from site. Soils and sediment removed from the site will be legally disposed of to comply with local, state, and federal regulations.

## Section 4.8 SOIL COMPACTION

The contractor shall restrict vehicle and equipment use in locations where vegetative stabilization will occur or where infiltration practices will be installed. The contractor shall utilize areas of proposed compacted or impervious surfaces to the greatest extent possible for vehicle or equipment maneuvering. The contractor will manage construction as well as placement of sand

below infiltrative stormwater management facilities. The design requires the removal of all fill in the areas of the infiltrative stormwater management facilities and replacement of the fill with sandy material to promote infiltration. The removal of fill and placement of sand in these areas will occur after the building is substantially constructed and heavy machinery is no longer necessary to travel on these areas.

## Section 4.9 STORM DRAIN INLETS

Silt sacks shall be installed at all drainage inlets in the general vicinity of the project site.

### Specific Storm Drain Inlet Controls

<b><u>Drain System Protection (Existing and New)</u></b>	
<b>Description:</b> Silt sacks will be installed at drainage structures and maintained and cleaned until all areas flowing to these structures are adequately stabilized with vegetation and/or final surface treatment.	
<b>Installation</b>	<ul style="list-style-type: none"> <li>Inlet protection will be installed prior to the start of construction. These protections will remain in place until all tributary surfaces have been fully stabilized.</li> </ul>
<b>Maintenance Requirements</b>	<ul style="list-style-type: none"> <li>Sediment within the drain system protection shall be checked twice each month and after each heavy rain. Silt shall be removed if greater than 6 in. deep or is impacting the function of the device.</li> <li>Clean, or remove and replace, the protection measures as sediment accumulates, the filter becomes clogged, and/or performance is compromised. Where there is evidence of sediment accumulation adjacent to the inlet protection measure, remove the deposited sediment by the end of the same business day in which it is found or by the end of the following business day if removal by the same business day is not feasible.</li> </ul>
<b>Design Specifications</b>	See Construction Detail Plans.

## Section 4.10 CONSTRUCTED SITE DRAINAGE FEATURE

### Specific Site Drainage Controls

<b><u>Diversions Swales</u></b>	
<b>Description:</b> The site drainage features to be installed are included in the site plans in Appendix A. These plans outline the various control practices that will be implemented during the construction of the site drainage features to manage erosion and control water velocity.	
<b>Installation</b>	As indicated in the Plans in Appendix A
<b>Maintenance Requirements</b>	Remove sediment accumulated before it reaches one-half of the above ground height of the proposed drainage features.

## Section 4.11 SEDIMENT BASINS OR SIMILAR IMPOUNDMENTS

Temporary sediment basins are depressions constructed downslope of construction activity and located such that stormwater runoff from upland areas and any construction diversion swales flow into the basin. After a contractor is selected, the contractor shall be responsible for installing sediment basin(s) to detain the 2-year, 24-hour storm, if needed. The basin(s) shall be kept in effective operating condition and sediment shall be removed when sediment accumulates to one-half of the design capacity of the basin, or sooner.

## Section 4.12 CHEMICAL TREATMENT

The use of chemical treatments is not proposed at this time. Should the Operator choose to use polymers, flocculants, or other treatment chemicals at the site, the operator must update the SWPPP to include the following:

- **Soil Types**
  - List all the soil types including soil types expected to be exposed during construction in areas of the project that will drain to chemical treatment systems and those expected to be found in fill material.
- **Treatment Chemicals**
  - List all treatment chemicals that will be used at the site and explain why these chemicals are suited to the soil characteristics.
  - Describe the dosage of all treatment chemicals you will use at the site or the methodology you will use to determine dosage.
  - Provide information from any applicable Safety Data Sheets (SDS).
  - Describe how each of the chemicals will be stored consistent with CGP Part 2.2.13c.
  - Include references to applicable State or local requirements affecting the use of treatment chemicals, and copies of applicable manufacturer's specifications regarding the use of your specific treatment chemicals and/or chemical treatment systems.
- **Special Controls for Cationic Treatment Chemicals** (if applicable)
  - If the applicable EPA Regional Office authorized you to use cationic treatment chemicals, include the official EPA authorization letter or other communication, and identify the specific controls and implementation procedures designed to ensure that your use of cationic treatment chemicals will not lead to a discharge that does not meet water quality standards.
- **Schematic Drawings of Stormwater Controls/Chemical Treatment Systems**
  - Provide schematic drawings of any chemically-enhanced stormwater controls or chemical treatment systems to be used for application of treatment chemicals.
- **Training**
  - Describe the training that personnel who handle and apply chemicals have received prior to permit coverage, or will receive prior to the use of treatment chemicals.

## Section 4.13 DEWATERING PRACTICE

When dewatering is required, the following practices shall be followed:

1. The contractor shall coordinate dewatering with all Local, State, and Federal agencies and obtain all required permits.
2. The contractor shall treat dewatering discharges with controls to minimize discharges of pollutants.
3. The contractor shall not discharge visible floating solids or foam.
4. The contractor shall use an oil-water separator or suitable filtration device (such as a cartridge filter) that is designed to remove oil, grease, or other products if dewatering water is found to contain these materials.
5. To the extent feasible, the contractor shall use vegetated, upland areas of the site to infiltrate dewatering water before discharge. Use of waters of the U.S. as part of the treatment area is prohibited.
6. At all points where dewatering water is discharged, the contractor shall comply with the velocity dissipation requirements of Part 2.2.11 of the CGP.
7. The contractor shall either haul backwash water away for disposal or return it to the beginning of the treatment process.
8. The contractor shall replace and clean the filter media used in dewatering devices when the pressure differential equals or exceeds the manufacturer's specifications.

The project requires the use dewatering bags as shown in the Detail Plans.

## Section 4.14 OTHER STORMWATER CONTROLS

Contractor shall update this SWPPP if any additional stormwater control measures have been adapted.

## Section 4.15 SITE STABILIZATION

### Total Amount of Land Disturbance Occurring at Any One Time

- Five Acres or less*  
 *More than Five Acres*

<b>Loam and Seed</b>
<input checked="" type="checkbox"/> <i>Vegetative</i> <input type="checkbox"/> <i>Non-Vegetative</i> <input type="checkbox"/> <i>Temporary</i> <input type="checkbox"/> <i>Permanent</i>
<b>Description:</b> <ul style="list-style-type: none"><li>• Areas of disturbed soils that do not receive a final surface treatment as part of the project will be loamed and seeded. Depending on the final vegetation type (maintained versus naturalized) different seed mixes shall be used accordingly. Initiation of the installation of stabilization measures will begin immediately in any areas of exposed soil where construction activities has permanently ceased or will be temporarily inactive for 14 or more days. Completion of the installation of stabilization measures will be completed as soon as practicable, but not later than seven days after stabilization has been initiated.</li></ul>

<b>Loam and Seed</b>	
<b>Installation</b>	Schedule for seed mix timing is to be determined after the contract project is awarded
<b>Completion</b>	Immediately in any areas of exposed soil where construction activities has permanently ceased or will be temporarily inactive for 14 or more days.
<b>Maintenance Requirements</b>	Irrigate as needed. Care shall be taken by contractor to maintain the loamed and seeded area for the proper growth of vegetation.

# SECTION 5 POLLUTION PREVENTION CONTROLS

## Section 5.1 POTENTIAL SOURCES OF POLLUTION

Construction Site Pollutants include the following:

<b>Pollutant-Generating Activity</b>	<b>Pollutants or Pollutant Constituents</b> (That could be discharged if exposed to stormwater)	<b>Location on Site</b> (Or reference SWPPP site map where this is shown)
Clearing/Grubbing/Earthwork	Sediment	Refer to Project Drawings
Paving Operations	Sediment, trash, oils	Refer to Project Drawings
Material Delivery/Storage	Sediment, oils, solids, chemicals	Site Entrance
Solid Waste	Solids	N/A
Spills	Sediment, Nutrients, oils, hazardous chemicals, other chemicals	N/A
Vehicle Storage	Sediment, oils, chemicals	N/A
Landscape Operations	Sediment, nutrients, bacteria	Refer to Project Drawings
Sanitary Facilities	Sediment, nutrients, bacteria	N/A

## Section 5.2 SPILL PREVENTION AND RESPONSE

The contractor will train all personnel in the proper handling and cleanup of spilled materials. No spilled hazardous materials or hazardous wastes will be allowed to come in contact with stormwater discharges. If such contact occurs, the stormwater discharge will be contained on-site until appropriate measures in compliance with State and Federal regulations are taken to dispose of such contaminated stormwater. It shall be the responsibility of the job site superintendent to properly train all personnel in spill prevention and cleanup procedures.

All materials with hazardous properties (such as pesticides, petroleum products, fertilizers, detergents, construction chemicals, acids, paints, paint solvents, cleaning solvents, additives for soil stabilization, concrete curing compounds and additives, etc.) will be stored in a secure location, with their lids on, preferably under cover, when not in use.

1. During construction, liquid petroleum products and other hazardous materials with the potential to contaminate groundwater shall not be stored or handled in areas of the site draining to an infiltration area. An 'infiltration area' is any area of the site that by design or as a result of soils, topography and other relevant factors accumulates runoff that infiltrates into the soil. Dikes, berms, sumps, and other Stormwater Pollution Prevention (SWPPP)

forms of secondary containment that prevent discharge to groundwater may be used to isolate portions of the site for the purpose of storage and handling of these materials.

2. A spill control and containment kit (containing, for example, absorbent materials, acid neutralizing power, brooms, dust pans, mops, rags, gloves, goggles, plastic and metal trash containers, etc.) will be provided at the site.

Manufacturer's recommended methods for spill cleanup will be clearly posted and site personnel will be trained regarding these procedures and the location of the information and supplies.

In the event of a spill the following procedures should be followed:

1. All spills will be cleaned up immediately after discovery.
2. The spill area will be kept well ventilated and personnel will wear appropriate protective clothing to prevent injury from contact with the hazardous substances.
3. The project manager and the Engineer of Record will be notified immediately.
4. Spills of toxic or hazardous materials will be reported to the appropriate Federal, State, and/or Local government agency, regardless of the size of the spill.
5. The Sharon Fire Department will be contacted: Call 911 or (781) 784-2121.
6. If the spill exceeds a Reportable Quantity, the SWPPP must be modified within seven (7) calendar days of knowledge of the discharge to provide a description of the release, the circumstances leading to the release, and the date of the release, The plans must identify measures to prevent the recurrence of such release and to respond to such releases.

The job site superintendent will be the spill prevention and response coordinator. He/she will designate the individuals who will receive spill prevention and response training. These individuals will each become responsible for a particular phase of prevention and response. The names of these personnel will be posted on site.

## Section 5.3 FUELING AND MAINTENANCE OF EQUIPMENT AND VEHICLES

The Contractor shall minimize fueling and equipment maintenance on site as this is an active drinking water supply property. The Contractor shall take extreme care if fueling and maintenance is performed on site.

Inspect construction vehicles daily and repair any leaks immediately. Dispose of all used oil, antifreeze, solvents, and other automotive-related chemicals according to manufacturer instructions off-site. These wastes require special handling and disposal. Used oil, antifreeze, and some solvents can be recycled at designated facilities, but other chemicals must be disposed of at a hazardous waste disposal site.

Vehicle maintenance operations produce substantial amounts of hazardous and other wastes that require regular disposal. Cleanup spills and dispose of cleanup materials off-site immediately. Inspect equipment and storage containers regularly to identify leaks or signs of deterioration.

## Section 5.4 WASHING OF EQUIPMENT AND VEHICLES

Contractor shall minimize washing of equipment and vehicles on site. If the Contractor must, the Contractor shall designate a special paved area for the washing of vehicles and area shall be designated with a sign.

### Specific Pollution Prevention Practices

<b>Washing of Equipment / Vehicles</b>	
<b>Description:</b> Contractor shall locate a special paved area for the washing of equipment or vehicles. Area shall have a sign that designates it as a washout area. To direct wash water to treatment facilities, ensure that vehicle washing areas are impervious and are equipped with a berm. Use blowers or vacuums instead of water to remove dry materials from vehicles if possible. Because water alone can remove most dirt adequately, use high-pressure water spray without detergents at vehicle washing areas. If contractor must use detergents, they shall avoid phosphate- or organic-based cleansers to reduce nutrient enrichment and biological oxygen demand in wastewater. Use only biodegradable products that are free of halogenated solvents. Clearly mark all washing areas, and inform workers that all washing must occur in this area. Do not perform other activities, such as vehicle repairs, in the wash area.	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	TBD
<b>Design Specifications</b>	N/A

## Section 5.5 STORAGE, HANDLING, AND DISPOSAL OF BUILDING PRODUCTS, MATERIALS, AND WASTES

### Section 5.5.1 Building Materials and Building Products

The project will result in construction and domestic debris and waste. Contractor shall supply the means to minimize the exposure of construction products, materials, and waste to precipitation and stormwater. The contractor shall provide facilities to properly handle and dispose of waste with considerations for health and safety of the employees.

### Specific Pollution Prevention Practices

<b>Storage, Containment, Handling of Materials</b>	
<p><b>Description:</b> Contractor shall designate a waste collection area on site that does not receive a substantial amount of runoff from upland areas and does not drain directly to a water body.</p> <ul style="list-style-type: none"> <li>• Ensure that containers have lids so they can be covered before periods of rain, and keep containers in a covered area whenever possible.</li> <li>• Schedule waste collection to prevent the containers from overflowing.</li> <li>• Clean spills immediately. For hazardous materials, follow cleanup instructions on the package. Use an absorbent material such as sawdust or kitty litter to contain the spill.</li> <li>• During the demolition phase of construction, provide extra containers and schedule more frequent pickups.</li> <li>• Collect, remove and dispose of all construction site wastes at authorized disposal areas.</li> <li>• Contact a local environmental agency to identify these disposal sites.</li> </ul>	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	N/A
<b>Design Specifications</b>	N/A

## Section 5.5.2 Pesticides, Herbicides, Insecticides, Fertilizers, and Landscape Materials (CGP 2.3.3.b) General

Fertilizers are not planned to be used on the landscape areas throughout the project site at the time of this SWPPP preparation. If fertilizers are used, the contractor shall follow all regulations that apply to the use, handling, or disposal of pesticides and fertilizers. Contractor shall store fertilizers and pesticides in a dry, covered area and will take precautions to minimize the exposure of these chemicals to precipitation and to stormwater.

### Specific Pollution Prevention Practice

<b>Proper Handling and Application of Materials</b>	
<p><b>Description:</b></p> <ul style="list-style-type: none"> <li>• Contractor shall follow all Federal, State, and Local regulations that apply to the use, handling, or disposal of pesticides and fertilizers.</li> <li>• Contractor shall not handle the materials any more than necessary.</li> <li>• Contractor shall store pesticides and fertilizers in a dry, covered area.</li> <li>• Contractor shall construct berms or dikes to contain stored pesticides and fertilizers in case of spillage.</li> <li>• Contractor shall follow the recommended application rates and methods for the products.</li> <li>• Contractor shall have equipment and absorbent materials available in storage and application areas to contain and cleanup any spills that occur.</li> </ul>	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	N/A
<b>Design Specifications</b>	N/A

### Section 5.5.3 Diesel Fuel, Oil, Hydraulic Fluids, Other Petroleum Products, and Other Chemicals (CGP 2.3.3.c)

Any on-site fueling shall be limited to vehicles that are to remain onsite. Other fluids shall not be stored on-site with all maintenance on vehicles being completed at off-site locations. Should storage of materials on site be required, Contractor shall store materials in water-tight containers and provide cover to minimize the exposure of these products to precipitation and stormwater.

#### Specific Pollution Prevention Practices

<b>Material Handling</b>	
<b>Description:</b>	
<ul style="list-style-type: none"> <li>• Contractor shall store new and used petroleum products for vehicles in covered areas with berms or dikes in place to contain any spills.</li> <li>• Immediately contain and cleanup any spills with absorbent materials.</li> <li>• Have equipment available in fuel storage areas and in vehicles to contain and cleanup any spills that occur.</li> </ul>	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	Contractor shall clean up spills immediately, using dry clean-up methods where possible, and dispose of used materials properly. Contractor is prohibited from hosing down areas to clean surfaces or spills. Contractor shall eliminate the source of the spill to prevent a discharge or a furtherance of an ongoing discharge.
<b>Design Specifications</b>	N/A

### Section 5.5.4 Hazardous or Toxic Waste (CGP 2.3.3.d)

Should the project result in the generation of toxic or hazardous wastes, the Contractor shall store materials in containers which are constructed to prevent leakage and corrosion.

#### Specific Pollution Prevention Practices

<b>Material Handling</b>	
<p><b>Description:</b></p> <ul style="list-style-type: none"> <li>• Contractor shall consult with local waste management authorities about the requirements for disposing of hazardous materials.</li> <li>• To prevent leaks, empty and clean hazardous waste containers before disposing of them.</li> <li>• Never remove the original product label from the container because it contains important safety information. Follow the manufacturer’s recommended method of disposal, which should be printed on the label.</li> <li>• Never mix excess products when disposing of them, unless specifically recommended by the manufacturer.</li> <li>• Contractor shall separate hazardous or toxic waste from construction and domestic waste.</li> <li>• Waste shall be stored in sealed containers, which are constructed of suitable materials to prevent leakage and corrosion, and which are labeled in accordance with applicable Resource Conservation and Recovery Act (RCRA) requirements and all other applicable Federal, State, or Local requirements.</li> <li>• All outside containers shall be stored within appropriately-sized secondary containment (spill berms, decks, spill containment pallets) to prevent spills from being discharged.</li> <li>• Contractor shall clean up spills immediately, using dry clean-up methods, and dispose of used materials properly. Contractor is prohibited from hosing the area down to clean surfaces or spills. Contractor shall eliminate the source of the spill to prevent a discharge or a furtherance of an ongoing discharge.</li> </ul> <p>To ensure the proper disposal of any contaminated soils that have been exposed to and still contain hazardous substances, the contractor shall consult with State or Local solid waste regulatory agencies or private firms. Some landfills might accept contaminated soils, but they require laboratory tests first. Any disposal of contaminated soils shall be coordinated with the Project Engineer and shall conform to all State and Local regulations.</p>	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	Review daily.
<b>Design Specifications</b>	N/A

## Section 5.5.5 Construction and Domestic Waste (CGP 2.3.3.e)

The project will result in construction and domestic debris and waste. The Contractor shall provide facilities to properly handle and dispose of waste with considerations for health and safety of employees.

### Specific Pollution Prevention Practices

<b>Waste Containers</b>	
<b>Description:</b>	
<ul style="list-style-type: none"> <li>• Contractor shall designate a waste collection area on site that does not receive a substantial amount of runoff from upland areas and does not drain directly to a water body.</li> <li>• Contractor shall provide waste containers of sufficient size and number to contain construction and domestic wastes.</li> <li>• Contractor shall ensure that containers have lids so they can be covered before periods of rain, and shall keep containers in a covered area whenever possible.</li> <li>• Contractor shall schedule waste collection to prevent the containers from overflowing.</li> <li>• Contractor shall cleanup spills immediately.</li> <li>• Contractor shall collect, remove and dispose of all construction site wastes at authorized disposal areas. Contact a local environmental agency to identify these disposal sites.</li> </ul>	
<b>Installation</b>	TBD
<b>Maintenance Requirements</b>	Review daily.
<b>Design Specifications</b>	N/A

## Section 5.5.6 Sanitary Waste (CGP 2.3.3.f)

Temporary facilities shall be provided by the contractor for on-site use by employees. This section shall be updated by the contractor once the project is awarded and temporary facilities has been included on-site.

### Specific Pollution Prevention Practices

<b>Temporary Facilities</b>	
<b>Description:</b> Temporary facilities shall be provided by the contractor.	
<b>Installation</b>	Temporary facilities will be installed at the beginning of the project. Facilities shall be positioned so that they are secure and will not be tipped or knocked over. Temporary facilities shall be located away from the waters of the U.S. and stormwater inlets and conveyances.
<b>Maintenance Requirements</b>	Temporary facilities shall have routine inspections and shall be scheduled for waste collection as needed.
<b>Design Specifications</b>	N/A

## Section 5.6 WASHING OF APPLICATORS AND CONTAINERS USED FOR STUCCO, PAINT, CONCRETE, FORM RELEASE OILS, CUTTING COMPOUNDS, OR OTHER MATERIALS

Should washout of paint of other materials be required, Contractor shall direct wash water into leak-proof containers or lined pit designed so that no overflows can occur due to inadequate sizing or precipitation.

**Specific Pollution Prevention Practices**

<b>Washout Container</b>	
<p><b>Description:</b> Contractor shall direct wash water into a leak-proof container or leak-proof and lined pit designed so that no overflows can occur due to inadequate sizing or precipitation. If the washout of paint or other materials are required, Contractor shall handle washout or cleanout wastes as follows:</p> <ul style="list-style-type: none"> <li>• Contractor shall not dump liquid wastes in storm sewers or waters of the U.S.</li> <li>• Contractor shall dispose of liquid wastes in accordance with applicable requirements in Part 2.3.3 of the 2017 CGP.</li> <li>• Contractor shall remove and dispose of hardened concrete waste consistent with the handling of other construction wastes.</li> </ul>	
<b>Installation</b>	Washout container will be installed as required for the project. Any washout or cleanout activities will be located as far away as possible from the waters of the U.S. and stormwater inlets or conveyances, and, to the extent feasible, the contractor shall designate the washout areas to be used for washout or cleanout only.
<b>Maintenance Requirements</b>	Maintenance of the washout is to include removal of hardened concrete. The facility shall have sufficient volume to contain all the concrete waste resulting from washout and a minimum freeboard of 1 foot. Facility shall not be filled beyond 95% capacity and shall be cleaned out once 75% full unless a new facility is constructed.
<b>Design Specifications</b>	N/A

## Section 5.7 APPLICATION OF FERTILIZERS

At the time of the preparation of this SWPPP, fertilizers are not planned to be used on the landscape areas throughout the project site. If the contractor deems fertilizers necessary, and approved by the Engineer and Owner, the Contractor shall follow all regulations that apply to the use, handling, or disposal of fertilizers. Contractor shall store fertilizers in a dry, covered area and will take precautions to minimize the exposure of these chemicals to precipitation and to stormwater.

**Specific Pollution Prevention Practices**

<b>Appropriate Use</b>	
<ul style="list-style-type: none"> <li>• <b>Description:</b> Type and amount of fertilizer is to be determined by the final plantings determined for the site.</li> </ul>	

<b>Appropriate Use</b>	
<b>Installation</b>	Fertilizer shall be applied at the appropriate time of year to coincide as closely as possible to the period of maximum vegetation uptake and growth. Contractor shall apply fertilizer at a rate in amounts consistent with manufacturer's specifications. Contractor shall avoid applying fertilizers before heavy rains that could cause excess nutrients to be discharged. Contractor shall never apply fertilizers to frozen ground. Contractor shall never apply fertilizers to stormwater conveyance channels. Contractor shall follow all Federal, State, and Local requirements regarding fertilizer application.
<b>Maintenance Requirements</b>	N/A
<b>Design Specifications</b>	N/A

## Section 5.8 OTHER POLLUTION PREVENTION PRACTICES

Contractor shall provide information below about any other pollution prevention practices that are implemented during construction that are not described above.

# SECTION 6 INSPECTION, MAINTENANCE, AND CORRECTIVE ACTION

## Section 6.1 INSPECTION PERSONNEL AND PROCEDURES

### **Instructions (see CGP Parts 4, 5, and 7.2.7):**

Describe the procedures you will follow for maintaining your stormwater controls, conducting inspections, and, where necessary, taking corrective actions in accordance with CGP Parts 4, 5, and 7.2.7.

Inspection Personnel shall be designated by the Contractor after the construction contract is awarded.

### **Site Inspection Schedule**

#### **Standard Frequency:**

- Every 7 calendar days
- Every 14 calendar days and within 24 hours of either:
  - A storm event that produces 0.25 inches or more of rain within a 24-hour period (including when there are multiple, smaller storms that alone produce less than 0.25 inches but together produce 0.25 inches or more in 24 hours), or
  - A storm event that produces 0.25 inches or more of rain within a 24-hour period on the first day of a storm and continues to produce 0.25 inches or more of rain on subsequent days (you conduct an inspection within 24 hours of the first day of the storm and within 24 hours after the last day of the storm that produces 0.25 inches or more of rain (i.e., only two inspections would be required for such a storm event)), or
  - A discharge caused by snowmelt from a storm event that produces 3.25 inches or more of snow within a 24-hour period.

#### **Reduced Frequency (if applicable)**

##### **For stabilized areas**

- Twice during first month, no more than 14 calendar days apart; then once per month after first month until permit coverage is terminated consistent with Part 9 in any area of your site where the stabilization steps in 2.2.14.a have been completed.
  - Specify locations where stabilization steps have been completed
  - Insert date that they were completed(Note: It is likely that you will not be able to include this in your initial SWPPP. If you qualify for this reduction (see CGP Part 4.4.1), you will need to modify your SWPPP to include this information. If construction activity resumes in this portion of the site at a later date, the inspection frequency immediately increases to that required in Parts 4.2 and 4.3, as applicable.)

**For stabilized areas on “linear construction sites” (as defined in Appendix A)**

- Twice during first month, no more than 14 calendar days apart; then once more within 24 hours of a storm event that produces 0.25 inches or more of rain within a 24-hour period, or within 24 hours of a snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period
  - Specify locations where stabilization steps have been completed
  - Insert date that they were completed(Note: It is likely that you will not be able to include this in your initial SWPPP. If you qualify for this reduction (see CGP Part 4.4.1), you will need to modify your SWPPP to include this information.)

**For arid, semi-arid, or drought-stricken areas during seasonally dry periods or during drought**

- Once per month and within 24 hours of either:
  - A storm event that produces 0.25 inches or more of rain within a 24-hour period, or
  - A snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period.

Insert beginning and ending month identified as the seasonally dry period for your area or the valid period of drought:

- Beginning month of the seasonally dry period: Insert approximate date
- Ending month of the seasonally dry period: Insert approximate date

**For frozen conditions where construction activities are being conducted**

- Once per month

Insert beginning and ending dates of frozen conditions on your site:

- Beginning date of frozen conditions: Insert approximate date
- Ending date of frozen conditions: Insert approximate date

**For frozen conditions where construction activities are suspended**

- Inspections are temporarily suspended

Insert beginning and ending dates of frozen conditions on your site:

- Beginning date of frozen conditions: Insert approximate date
- Ending date of frozen conditions: Insert approximate date

**Dewatering Inspection Schedule**

Select the inspection frequency that applies based on CGP Part 4.3.2

**Dewatering Inspection**

- Once per day on which the discharge of dewatering water occurs.

**Site Inspection Report Forms**

See Appendix D for inspection report form.

## Section 6.2 CORRECTIVE ACTION

**Instructions (CGP Parts 5 and 7.2.7):**

- Describe the procedures for taking corrective action in compliance with CGP Part 5.

**Personnel Responsible for Corrective Actions**

The Contractor shall be responsible for corrective actions. The Contractor will be selected following public bidding.

**Corrective Action Forms**

See Appendix E for Corrective Action Form.

## Section 6.3 DELEGATION OF AUTHORITY

**Instructions:**

- Identify the individual(s) or positions within the company who have been delegated authority to sign inspection reports.
- Attach a copy of the signed delegation of authority (see example in Appendix J of this SWPPP Template.)
- For more on this topic, see Appendix G, Subsection 11 of EPA's CGP.

**Duly Authorized Representative(s) or Position(s):**

This section of the SWPPP will be updated after the project contract is awarded.

See Appendix J for Delegation of Authority documentation.

# SECTION 7 CERTIFICATION AND NOTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

## APPENDIX A

### Site Plans

*(Provided under separate cover)*

APPENDIX B

2022 CGP

*(Provided under separate cover)*

APPENDIX C  
NOI and EPA Authorization Email

This appendix will be updated after the NOI has been submitted by the Contractor.

APPENDIX D  
Site Inspection Form and Dewatering Inspection Form

<b>Section A – General Information</b> (If necessary, complete additional inspection reports for each separate inspection location.)	
<b>Inspector Information</b>	
<b>Inspector Name:</b>	<b>Title:</b>
<b>Company Name:</b>	<b>Email:</b>
<b>Address:</b>	<b>Phone Number:</b>
<b>Inspection Details</b>	
<b>Inspection Date:</b>	<b>Inspection Location:</b>
<b>Inspection Start Time:</b>	<b>Inspection End Time:</b>
<b>Current Phase of Construction:</b>	<b>Weather Conditions During Inspection:</b>
<b>Did you determine that any portion of your site was unsafe for inspection per CGP Part 4.5?</b> <input type="checkbox"/> Yes <input type="checkbox"/> No <b>If “Yes,” provide the following information:</b> Location of unsafe conditions: The conditions that prevented you inspecting this location:	
<b>Indicate the required inspection frequency:</b> (Check all that apply. You may be subject to different inspection frequencies in different areas of the site.)	
<b>Standard Frequency (CGP Part 4.2):</b> <input type="checkbox"/> At least once every 7 calendar days; <b>OR</b> <input type="checkbox"/> Once every 14 calendar days <i>and</i> within 24 hours of the occurrence of either: <ul style="list-style-type: none"> <li>• A storm event that produces 0.25 inches or more of rain within a 24-hour period, or</li> <li>• A snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period</li> </ul>	
<b>Increased Frequency (CGP Part 4.3.1)</b> (If site discharges to sediment or nutrient-impaired waters or to waters designated as Tier 2, Tier 2.5, or Tier 3): <input type="checkbox"/> Once every 7 calendar days <i>and</i> within 24 hours of the occurrence of either: <ul style="list-style-type: none"> <li>• A storm event that produces 0.25 inches or more of rain within a 24-hour period, or</li> <li>• A snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period</li> </ul>	

**Reduced Frequency (CGP Part 4.4):**

- For stabilized areas: Twice during first month, no more than 14 calendar days apart; then once per month after first month until permit coverage is terminated
- For stabilized areas on "linear construction sites": Twice during first month, no more than 14 calendar days apart; then once more within 24 hours of the occurrence of either:
  - A storm event that produces 0.25 inches or more of rain within a 24-hour period, or
  - A snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period
- For arid, semi-arid, or drought-stricken areas during seasonally dry periods or during drought: Once per month and within 24 hours of the occurrence of either:
  - A storm event that produces 0.25 inches or more of rain within a 24-hour period, or
  - A snowmelt discharge from a storm event that produces 3.25 inches or more of snow within a 24-hour period
- For frozen conditions where construction activities are being conducted: Once per month

**Was this inspection triggered by a storm event producing 0.25 inches or more of rain within a 24-hour period?**  Yes  No

**If "Yes," how did you determine whether the storm produced 0.25 inches or more of rain?**

- On-site rain gauge
- Weather station representative of site.  
Weather station location:

**Total rainfall amount that triggered the inspection (inches):**

**Was this inspection triggered by a snowmelt discharge from a storm event producing 3.25 inches or more of snow within a 24-hour period?**  Yes  No

**If "Yes," how did you determine whether the storm produced 3.25 inches or more of snow?**

- On-site rain gauge
- Weather station representative of site.  
Weather station location:

**Total snowfall amount that triggered the inspection (inches):**

Section B – Condition and Effectiveness of Erosion and Sediment (E&S) Controls (CGP Part 2.2) (Insert additional rows if needed)					
Type and Location of E&S Control	Conditions Requiring Routine Maintenance? <sup>1</sup>	If “Yes,” How Many Times (Including This Occurrence) Has This Condition Been Identified?	Conditions Requiring Corrective Action? <sup>2, 3</sup>	Date on Which Condition First Observed (If Applicable)?	Description of Conditions Observed
1.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
2.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
3.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
4.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
5.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
<p><b>If the same routine maintenance was found to be necessary three or more times for the same control at the same location (including this occurrence), follow the corrective action requirements and record the required information in your corrective action log, or describe here why you believe the specific condition should still be addressed as routine maintenance:</b></p>					

<sup>1</sup> Routine maintenance includes minor repairs or other upkeep performed to ensure that the site’s stormwater controls remain in effective operating condition, not including significant repairs or the need to install a new or replacement control. Routine maintenance is also required for specific conditions: (1) for perimeter controls, whenever sediment has accumulated to half or more the above-ground height of the control (CGP Part 2.2.3.c.i); (2) where sediment has been tracked-out from the site onto paved roads, sidewalks, or other paved areas (CGP Part 2.2.4.d); (3) for inlet protection measures, when sediment accumulates, the filter becomes clogged, and/or performance is compromised (CGP Part 2.2.10.b); and (4) for sediment basins, as necessary to maintain at least half of the design capacity of the basin (CGP Part 2.2.12.f)

<sup>2</sup> Corrective actions are triggered only for specific conditions (CGP Part 5.1):

1. A stormwater control needs a significant repair or a new or replacement control is needed, or, in accordance with Part 2.1.4.c, you find it necessary to repeatedly (i.e., three (3) or more times) conduct the same routine maintenance fix to the same control at the same location (unless you document in your inspection report under Part 4.7.1.c that the specific reoccurrence of this same problem should still be addressed as a routine maintenance fix under 2.1.4); or
2. A stormwater control necessary to comply with the requirements of this permit was never installed, or was installed incorrectly; or
3. Your discharges are not meeting applicable water quality standards; or
4. A prohibited discharge has occurred (see CGP Part 1.3); or
5. During the discharge from site dewatering activities:
  - a. The weekly average of your turbidity monitoring results exceeds the 50 NTU benchmark (or alternate benchmark if approved by EPA pursuant to Part 3.3.2.b); or
  - b. You observe or you are informed by EPA, State, or local authorities of the presence of the conditions specified in Part 4.6.3.e.

<sup>3</sup> If a condition on your site requires a corrective action, you must also fill out a corrective action log found at <https://www.epa.gov/npdes/construction-general-permit-resources-tools-and-templates>. See CGP Part 5.4 for more information.

Section C – Condition and Effectiveness of Pollution Prevention (P2) Practices and Controls (CGP Part 2.3)					
(Insert additional rows if needed)					
Type and Location of P2 Practices and Controls	Conditions Requiring Routine Maintenance? <sup>1</sup>	If “Yes,” How Many Times (Including This Occurrence) Has This Condition Been Identified?	Conditions Requiring Corrective Action? <sup>2, 3</sup>	Date on Which Condition First Observed (If Applicable)?	Description of Conditions Observed
1.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
2.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
3.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
4.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
5.	<input type="checkbox"/> Yes <input type="checkbox"/> No		<input type="checkbox"/> Yes <input type="checkbox"/> No		
<p>If the same routine maintenance was found to be necessary three or more times for the same control at the same location (including this occurrence), follow the corrective action requirements and record the required information in your corrective action log, or describe here why you believe the specific condition should still be addressed as routine maintenance:</p>					

Section D – Stabilization of Exposed Soil (CGP Part 2.2.14) (Insert additional rows if needed)					
Specific Location That Has Been or Will Be Stabilized	Stabilization Method and Applicable Deadline	Stabilization Initiated?	Final Stabilization Criteria Met?	Final Stabilization Photos Taken?	Notes
1.		<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date initiated:	<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date criteria met:	<input type="checkbox"/> Yes <input type="checkbox"/> No	
2.		<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date initiated:	<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date criteria met:	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.		<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date initiated:	<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date criteria met:	<input type="checkbox"/> Yes <input type="checkbox"/> No	
4.		<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date initiated:	<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date criteria met:	<input type="checkbox"/> Yes <input type="checkbox"/> No	
5.		<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date initiated:	<input type="checkbox"/> Yes <input type="checkbox"/> No If "Yes," date criteria met:	<input type="checkbox"/> Yes <input type="checkbox"/> No	

Section E – Description of Discharges (CGP Part 4.6.2) <i>(Insert additional rows if needed)</i>	
<p><b>Was a discharge (not including dewatering) occurring from any part of your site at the time of the inspection?<sup>4</sup></b>    <input type="checkbox"/> Yes    <input type="checkbox"/> No</p> <p><b>If “Yes,” for each point of discharge, document the following:</b></p> <ul style="list-style-type: none"> <li>• The visual quality of the discharge.</li> <li>• The characteristics of the discharge, including color; odor; floating, settled, or suspended solids; foam; oil sheen; and other indicators of stormwater pollutants.</li> <li>• Signs of the above pollutant characteristics that are visible from your site and attributable to your discharge in receiving waters or in other constructed or natural site drainage features.</li> </ul>	
Discharge Location	Observations
1.	
2.	
3.	
4.	
5.	

<sup>4</sup> If a dewatering discharge was occurring, you must conduct a dewatering inspection pursuant to CGP Part 4.3.2 and complete a separate dewatering inspection report.

**Section F – Signature and Certification (CGP Part 4.7.2)**

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information contained therein. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information contained is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

**MANDATORY: Signature of Operator or "Duly Authorized Representative:"**

<b>Signature:</b>	<b>Date:</b>
<b>Printed Name:</b>	<b>Affiliation:</b>

**OPTIONAL: Signature of Contractor or Subcontractor**

<b>Signature:</b>	<b>Date:</b>
<b>Printed Name:</b>	<b>Affiliation:</b>

## **General Tips for Using This Template**

This Site Inspection Report Template is provided to assist you in preparing site inspection reports for EPA's 2022 Construction General Permit (CGP). If you are covered under the 2022 CGP, you can use this template to create a site inspection report form that is customized to the specific circumstances of your site and that complies with the minimum reporting requirements of Part 4.7 of the permit. Note that the use of this form is optional; you may use your own site inspection report form provided it includes the minimum information required in Part 4.7 of the CGP.

This template does not address the CGP's inspection reporting requirements related to dewatering activities. A separate inspection template has been developed specifically for dewatering activities and is available at <https://www.epa.gov/npdcs/construction-general-permit-resources-tools-and-templates>.

Keep in mind that this document is a template and not an "off-the-shelf" inspection report that is ready to use without some modification. You must first customize this form to include the specifics of your project in order for it to be useable for your inspection reports. Once you have entered all of your site-specific information into the blank fields, you may use this form to complete inspection reports.

The following tips for using this template will help you ensure that the minimum permit requirements are met:

- **Review the inspection requirements.** Before you start developing your inspection report form, read the CGP's Part 4 inspection requirements. This will ensure that you have a working understanding of the permit's underlying inspection requirements.
- **Complete all required blank fields.** Fill out all blank fields. Only by filling out all fields will the template be compliant with the requirements of the permit. (Note: Where you do not need the number of rows provided in the template form for your inspection, you may delete these or cross them off as you see fit. Or, if you need more space to document your findings, you may insert additional rows in the electronic version of this form or use the bottom of the page in the field version of this form.)
- **Use your site map to document inspection findings.** In several places in the template, you are directed to specify the location of certain features of your site, including where stormwater controls are installed and where you will be stabilizing exposed soil. You are also asked to fill in location information for unsafe conditions and the locations of any discharges occurring during your inspections. Where you are asked for location information, EPA encourages you to reference the point on your SWPPP site map that corresponds to the requested location on the inspection form. Using the site map as a tool in this way will help you conduct efficient inspections, will assist you in evaluating problems found, and will ensure proper documentation.
- **Complete the inspection report within 24 hours of completing a site inspection.** You must complete an inspection report in accordance with Part 4.7.1 of the CGP.
- **Include the inspection form with your SWPPP.** Once your form is complete, make sure to include a copy of the inspection form in your SWPPP in accordance with Part 7.2.7.e of the CGP.
- **Retain copies of all inspection reports with your records.** You must also retain in your records copies of all inspection reports in accordance with the requirements in Part 4.7.3 of the CGP. These reports must be retained for at least 3 years from the date your permit coverage expires or is terminated in accordance with the requirements in Part 4.7.4 of the CGP.

## **Instructions for Section A**

### **Inspector Name**

Enter the name of the person that conducted the inspection. Include the person's contact information (title, affiliated company name, address, email, and phone number).

### **Inspection Date and Time**

Enter the date you performed the inspection and the time you started and ended the inspection.

### **Weather Conditions During Inspection**

Enter the weather conditions occurring during the inspection, e.g., sunny, overcast, light rain, heavy rain, snowing, icy, windy.

### **Current Phase of Construction**

If this project is being completed in more than one phase, indicate which phase it is currently in.

### **Inspection Location**

If your project has multiple locations where you conduct separate inspections, specify the location where this inspection is being conducted. If only one inspection is conducted for your entire project, enter "Entire Site." If necessary, complete additional inspection report forms for each separate inspection location.

### **Unsafe Conditions for Inspection (CGP Part 4.5.7)**

Inspections are not required where a portion of the site or the entire site is subject to unsafe conditions. These conditions should not regularly occur and should not be consistently present on a site. Generally, unsafe conditions are those that render the site (or a portion of it) inaccessible or that would pose a significant probability of injury to applicable personnel. Examples could include severe storm or flood conditions, high winds, and downed electrical wires.

If your site, or a portion of it, is affected by unsafe conditions during the time of your inspection, provide a description of the conditions that prevented you from conducting the inspection and what parts of the site were affected. If the entire site was considered unsafe, specify the location as "Entire Site."

### **Inspection Frequency**

Check all the inspection frequencies that apply to your project. Note that you may be subject to different inspection frequencies in different areas of your site.

### **Inspection Triggered by a Storm Event**

If you were required to conduct this inspection because of a storm event that produced 0.25 inches or more of rain within a 24-hour period, indicate whether you relied on an on-site rain gauge or a nearby weather station (and where the weather station is located). Also, specify the total amount of rainfall for this specific storm event.

If you were required to conduct this inspection because of a snowmelt discharge from a storm event that produced 3.25 inches or more of snow within a 24-hour period, then indicate whether you relied on an on-site measurement or a nearby weather station (and where the weather station is located). Also, specify the total amount of snowfall for this specific storm event.

## **Instructions for Section B**

### **Type and Location of Erosion and Sediment (E&S) Controls**

Provide a list of all erosion and sediment (E&S) controls that your SWPPP indicates will be installed and implemented at your site. This list must include at a minimum all E&S controls required by CGP Part 2.2. Include also any natural buffers established under CGP Part 2.2.1. Buffer requirements apply if your project's earth-disturbing activities will occur within 50 feet of a discharge to receiving water. You may group your E&S controls on your form if you have several of the same type of controls (e.g., you may group "Inlet Protection Measures," "Perimeter Controls," and "Stockpile Controls" together on one line), but if there are any problems with a specific control, you must separately identify the location of the control, whether routine maintenance or corrective action is necessary, and in the notes section you must describe the specifics about the problem you observed.

### **Conditions Requiring Routine Maintenance?**

Answer "Yes" if the E&S control requires routine maintenance as defined in footnote 1 of this template. Note that in many cases, "Yes" answers are expected and indicate a project with an active operation and maintenance program. You should also answer "Yes" if work to fix the problem is still ongoing from the previous inspection, though necessary work must be initiated immediately and completed by the end of the next business day or within seven calendar days if documented in accordance with CGP Part 2.1.4.b.

### **If "Yes," How Many Times (Including this Occurrence) Has this Condition Been Identified?**

Indicate how many times the routine maintenance has been required for the same control at the same location.

### **Conditions Requiring Corrective Action?**

Answer "Yes" if you found any of the conditions listed in footnote 2 in this template to be present during your inspection (CGP Part 5.1). If you answer "Yes," you must take corrective action and complete a corrective action log, found at <https://www.epa.gov/npdes/construction-general-permit-resources-tools-and-templates>. You should also answer "Yes" if work to fix the problem from a previous inspection is still ongoing, though the operator must comply with the corrective action deadlines in CGP Part 5.2.

### **Date on Which Condition First Observed (If Applicable)?**

Provide the date on which the condition that triggered the need for routine maintenance or corrective action was first identified. If the condition was just discovered during this inspection, enter the inspection date. If the condition is a carryover from a previous inspection, enter the original date of the condition's discovery.

### **Description of Conditions Observed**

For each E&S control and the area immediately surrounding it, describe whether the control is properly installed and whether it appears to be working to minimize sediment discharge. Indicate also whether a new or modified control is necessary to comply with the permit. Describe any problem condition(s) you observed such as the following:

1. Failure to install or to properly install a required E&S control
2. Damage or destruction to an E&S control caused by vehicles, equipment, or personnel, a storm event, or other event
3. Mud or sediment deposits found downslope from E&S controls, including in receiving waters, or on nearby streets, curbs, or open conveyance channels
4. Sediment tracked out onto paved areas by vehicles leaving construction site
5. Noticeable erosion or sedimentation at discharge outlets or at adjacent streambanks or channels
6. Erosion of the site's sloped areas (e.g., formation of rills or gullies)
7. E&S control is no longer working due to lack of maintenance
8. Other incidents of noncompliance

Describe also why you think the problem condition(s) occurred as well as actions (e.g., routine maintenance or corrective action) you will take or have taken to fix the problem.

For buffer areas, make note of whether they are marked off as required, whether there are signs of construction disturbance within the buffer, which is prohibited under the CGP, and whether there are visible signs of erosion resulting from discharges through the area.

If routine maintenance or corrective action is required, briefly note the reason. If routine maintenance or corrective action has been completed, make a note of the date it was completed and what was done. *If corrective action is required, note that you will need to complete a separate corrective action log describing the condition and your work to fix the problem.*

### **Routine Maintenance Need Has Been Found to be Necessary Three (3) or More Times for the Same Control at the Same Location (Including this Occurrence)**

If routine maintenance has been required three (3) or more times for the same control at the same location, the permit requires (CGP Part 2.1.4.c) you to fix the problem using the corrective action procedures in CGP Part 5 or to document why you believe the reoccurring problem can be addressed as a routine maintenance fix. If you believe the problem can continue to be fixed as routine maintenance, describe why you believe the specific condition should still be addressed as routine maintenance.

### **Instructions for Section C**

#### **Type and Location of Pollution Prevention (P2) Practices and Controls**

Provide a list of all pollution prevention (P2) practices and controls that are implemented at your site. This list must include all P2 practices and controls required by CGP Part 2.3 and those that are described in your SWPPP.

### **Conditions Requiring Routine Maintenance?**

Answer "Yes" if the P2 practice or control requires routine maintenance as defined in footnote 1 of this template. Note that in many cases, "Yes" answers are expected and indicate a project with an active operation and maintenance program. You should also answer "Yes" if work to fix the problem is still ongoing.

DRAFT

from the previous inspection, though necessary work must be initiated immediately and completed by the end of the next business day or within seven calendar days if documented in accordance with CGP Part 2.1.4.b.

**If “Yes,” How Many Times (Including this Occurrence) Has this Condition Been Identified?**

Indicate how many times the routine maintenance has been required for the same practice or control at the same location.

**Conditions Requiring Corrective Action?**

Answer “Yes” if you found any of the conditions listed in footnote 2 in this template to be present during your inspection (CGP Part 5.1). If you answer “Yes,” you must take corrective action and complete a corrective action log, found at <https://www.epa.gov/npdes/construction-general-permit-resources-tools-and-templates>. You should also answer “Yes” if work to fix the problem from a previous inspection is still ongoing, though the operator must comply with the corrective action deadlines in CGP Part 5.2.

**Date on Which Condition First Observed (If Applicable)?**

Provide the date on which the condition that triggered the need for maintenance or corrective action was first identified. If the condition was just discovered during this inspection, enter the inspection date. If the condition is a carryover from a previous inspection, enter the original date of the condition’s discovery.

**Description of Conditions Observed**

For each P2 control and the area immediately surrounding it, describe whether the control is properly installed, and whether it appears to be working to minimize or eliminate pollutant discharges. Indicate also whether a new or modified control is necessary to comply with the permit. Describe any problem condition(s) you observed such as the following:

1. Failure to install or to properly install a required P2 control
2. Damage or destruction to a P2 control caused by vehicles, equipment, or personnel, or a storm event
3. Evidence of a spill, leak, or other type of pollutant discharge, or failure to have properly cleaned up a previous spill, leak, or other type of pollutant discharge
4. Spill response supplies are absent, insufficient, or not where they are supposed to be located
5. Improper storage, handling, or disposal of chemicals, building materials or products, fuels, or wastes
6. P2 control is no longer working due to lack of maintenance
7. Other incidents of noncompliance

Describe also why you think the problem condition(s) occurred as well as actions (e.g., routine maintenance or corrective action) you will take or have taken to fix the problem.

If routine maintenance or corrective action is required, briefly note the reason. If routine maintenance or corrective action has been completed, make a note of the date it was completed and what was done. *If corrective action is required, note that you will need to complete a separate corrective action log describing the condition and your work to fix the problem.*

**Routine Maintenance Need Was Found to be Necessary Three (3) or More Times for the Same Control at the Same Location (Including this Occurrence)**

If routine maintenance has been required three (3) or more times for the same control at the same location, the permit requires (CGP Part 2.1.4.c) you to fix the problem using the corrective action procedures in CGP Part 5 or to document why you believe the reoccurring problem can be addressed as a routine maintenance fix. If you believe the problem can continue to be fixed as routine maintenance, describe why you believe the specific condition should still be addressed as routine maintenance.

**Instructions for Section D**

**Specific Location That Has Been or Will Be Stabilized**

List all areas where soil stabilization is required to begin because construction work in that area has permanently stopped or temporarily stopped (i.e., work will stop for 14 or more days), and all areas where stabilization has been implemented (CGP Part 2.2.14).

**Stabilization Method and Applicable Deadline**

For each area, specify the method of stabilization (e.g., hydroseed, sod, planted vegetation, erosion control blanket, mulch, rock).

Specify also which of the following stabilization deadlines apply to this location:

1. 5 acres or less of land disturbance occurring at any one time at site: Complete no later than 14 calendar days after stabilization initiated.
2. More than 5 acres of land disturbance occurring at any one time at site: Complete no later than 7 calendar days after stabilization initiated.
3. Arid, semi-arid, and drought-stricken areas: See CGP Part 2.2.14.b.i.
4. Unforeseen circumstances: See CGP Part 2.2.14.b.ii.
5. Discharges to a sediment- or nutrient-impaired water or to a water identified as Tier 2, 2.5, or 3 for antidegradation purposes: Complete no later than 7 days after stabilization initiated.

**Stabilization Initiated?**

For each area, indicate whether stabilization has been initiated. If "Yes," then enter the date stabilization was initiated.

**Final Stabilization Criteria Met?**

For each area, indicate whether the final stabilization criteria in CGP Part 2.2.14.c have been met. If "Yes," then enter the date final stabilization criteria were met.

**Final Stabilization Photos Taken?**

Answer "Yes" if you have taken photos before and after meeting the stabilization criteria as required in CGP Part 8.2.1.a.

**Notes**

For each area where stabilization has been initiated, describe the progress that has been made and what additional actions are necessary to complete stabilization. Note the effectiveness of stabilization in preventing erosion. If stabilization has been initiated but not completed, make a note of the date it is to be completed. If stabilization has been completed, make a note of the date it was completed. If stabilization has not yet been initiated, make a note of the date it is to be initiated and the date it is to be completed.

**Instructions for Section E**

You are only required to complete this section if a discharge is occurring at the time of the inspection (CGP Part 4.6.2).

**Was a discharge (not including dewatering) occurring from any part of your site at the time of the inspection?**

During your inspection, examine all points of discharge from your site, and determine whether a discharge is occurring. If a dewatering discharge was occurring, you must conduct a dewatering inspection pursuant to CGP Part 4.3.2. If there is a discharge, answer "Yes" and complete the questions below regarding the specific discharge. If there is not a discharge, answer "No" and skip to the next page.

**Discharge Location** (Repeat as necessary if there are multiple points of discharge.)

Specify the location on your site where the discharge is occurring. The location may be an outlet from a stormwater control or constructed stormwater channel, a discharge into a storm sewer inlet, or a specific point on the site. Be as specific as possible; it is recommended that you refer to a precise point on your site map.

**Observations**

Document the visual quality of the discharge and take note of the characteristics of the stormwater discharge, including color; odor; floating, settled, or suspended solids; foam; oily sheen; and other indicators of stormwater pollutants. Also, document signs of these same pollutant characteristics that are visible from your site and attributable to your discharge in receiving waters or in other constructed or natural site drainage features.

## **Instructions for Section F**

Each inspection report must be signed and certified to be considered complete (CGP Part 4.7.2).

### **Operator or “Duly Authorized Representative” – MANDATORY** (CGP Appendix G Part G.11.2 and CGP Appendix H Section X)

At a minimum, the site inspection report must be signed by either (1) the person who signed the NOI, or (2) a duly authorized representative of that person. The following requirements apply:

If the signatory will be the person who signed the NOI for permit coverage, as a reminder, that person must be one of the following types of individuals:

- *For a corporation:* By a responsible corporate officer. For the purpose of this subsection, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
- *For a partnership or sole proprietorship:* By a general partner or the proprietor, respectively.
- *For a municipality, State, Federal, or other public agency:* By either a principal executive officer or ranking elected official. For purposes of this subsection, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrator of EPA).

If the signatory will be a duly authorized representative, the following requirements must be met:

- The authorization is made in writing by the person who signed the NOI (see above);
- The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position); and
- The signed and dated written authorization is included in the SWPPP. A copy must be submitted to EPA, if requested.

Sign, date and print your name and affiliation.

### **Contractor or Subcontractor - OPTIONAL**

Where you rely on a contractor or subcontractor to complete the site inspection report, you should consider requiring the individual(s) to sign and certify each report. Note that this does not relieve you, the permitted operator, of the requirement to sign and certify the site inspection report as well. If applicable, sign, date, and print your name and affiliation.

### **Note**

While EPA has made every effort to ensure the accuracy of all instructions contained in this template, it is the permit, not this template, that determines the actual obligations of regulated construction stormwater discharges. In the event of a conflict between this template and any corresponding provision of the CGP, you must abide by the requirements in the permit. EPA welcomes comments on this Site Inspection Report Template at any time and will consider those comments in any future revision. You may contact EPA for CGP-related inquiries at [cgp@epa.gov](mailto:cgp@epa.gov)

<b>Section A – Dewatering Discharges (CGP Part 4.6.3)</b> Complete this section within 24 hours of completing the inspection. (If necessary, complete additional inspection reports for each separate inspection location.)	
Inspector Information	
Inspector Name:	Title:
Company Name:	Email:
Address:	Phone Number:
Inspection Details	
Inspection Date:	Inspection Location:
Discharge Start Time:	Discharge End Time:
Rate of Discharge (gallons per day):	Corrective Action Required? <sup>1</sup> <input type="checkbox"/> Yes <input type="checkbox"/> No
Describe Indicators of Pollutant Discharge at Point of Dewatering Discharge: <sup>1</sup>	
<b>Attach Photographs of:</b> <ol style="list-style-type: none"> <li>1. Dewatering water prior to treatment by a dewatering control(s) and the final discharge after treatment; and</li> <li>2. Dewatering control(s); and</li> <li>3. Point of discharge to any receiving waters flowing through or immediately adjacent to the site and/or to constructed or natural site drainage features, storm drain inlets, and other conveyances to receiving waters.</li> </ol>	

<sup>1</sup> If you observe any of the following indicators of pollutant discharge, you are required to take corrective action under Part 5.1.5.b:

- a sediment plume, suspended solids, unusual color, presence of odor, decreased clarity, or presence of foam; or
- a visible sheen on the water surface or visible oily deposits on the bottom or shoreline of the receiving water.

**Section B – Signature and Certification (CGP Part 4.7.2)**

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information contained therein. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information contained is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

## **General Tips for Using This Template**

This Dewatering Inspection Report Template is provided to assist you in preparing dewatering inspection reports for EPA's 2022 Construction General Permit (CGP). If you are covered under the 2022 CGP, you can use this template to create a dewatering inspection report form that complies with the minimum reporting requirements of Part 4.6.3 of the permit. Note that the use of this form is optional; you may use your own inspection report form provided it includes the minimum information required in Part 4.6.3 of the CGP.

This template is for dewatering inspections only. A separate site inspection report template that does not include dewatering inspections and complies with the minimum reporting requirements of Part 4.7 of the permit is available at <https://www.epa.gov/npdes/construction-general-permit-resources-tools-and-templates>.

If you are covered under a State CGP, this template may be helpful in developing a report that can be used for that permit; however, it will need to be modified to meet the specific requirements of that permit. If your permitting authority requires you to use a specific inspection report form, you should not use this form.

The following tips for using this template will help you ensure that the minimum permit requirements are met:

- **Review the inspection requirements.** Before you start developing your inspection report form, read the CGP's Part 4 inspection requirements. This will ensure that you have a working understanding of the permit's underlying inspection requirements.
- **Complete all required blank fields.** Fill out all blank fields. Only by filling out all fields will the template be compliant with the requirements of the permit. (Note: Where you do not need the number of rows provided in the template form for your inspection, you may delete these as you see fit. Or, if you need more space to document your findings, you may insert additional rows in the electronic version of this form or use the bottom of the page in the field version of this form.)
- **Use your site map to document inspection findings.** In several places in the template, you are directed to specify the location of certain features of your site, including where stormwater controls are installed and where you will be stabilizing exposed soil. You are also asked to fill in location information for unsafe conditions and the locations of any discharges occurring during your inspections. Where you are asked for location information, EPA encourages you to reference the point on your SWPPP site map that corresponds to the requested location on the inspection form. Using the site map as a tool in this way will help you conduct efficient inspections, will assist you in evaluating problems found, and will ensure proper documentation.
- **Include the inspection form with your SWPPP.** Once your form is complete, make sure to include a copy of the inspection form in your SWPPP in accordance with Part 7.2.7.e of the CGP.
- **Retain copies of all inspection reports with your records.** You must also retain copies of all inspection reports in your records in accordance with the requirements in Part 4.7.3 of the CGP. These reports must be retained for at least 3 years from the date your permit coverage expires or is terminated in accordance with the requirements in Part 4.7.4 of the CGP.

## **Instructions for Section A**

### **Inspector Name**

Enter the name of the person that conducted the inspection. Include the person's contact information (title, affiliated company name, address, email, and phone number).

### **Inspection Date**

Enter the date you performed the inspection.

### **Inspection Location**

If your project has multiple locations where you conduct separate dewatering inspections, specify the location where this inspection is being conducted. Otherwise, you can enter "dewatering operation."

### **Discharge Start and End Times**

Enter the approximate time the dewatering discharge started and ended on the day of the inspection.

DRAFT

### **Rate of Discharge**

Enter the rate of discharge in gallons per day on the day of inspection.

To estimate the approximate discharge rate on the day of dewatering inspection, one approach is to use the manufacturer's design pump rating for the pump model in use. For example, a pump rated at 164 gpm (gallons per minute) by the manufacturer can be assumed to be discharging at 164 gpm in most cases. To convert to gallons per day, multiply the rate in gpm by the ratio of minutes in one-day (1,440 minutes per day), resulting in a discharge rate of 236,160 gallons per day.

In cases where the dewatering discharge is being pumped over long distances or a substantial distance uphill, which will result in a reduced pump rate relative to manufacturer's specification, the operator may improve the accuracy of the estimate by estimating the time required to fill a container of a known volume. For example, if it takes 60 seconds to fill an empty 55-gallon barrel, the estimated discharge rate is 55 gpm, or 79,200 gallons per day.

### **Indicators of Pollutant Discharge**

For the point of discharge, describe any observed sediment plume, suspended solids, unusual color, presence of odor, decreased clarity, or presence of foam; and/or a visible sheen on the water surface or visible oily deposits on the bottom or shoreline of the receiving water.

### **Corrective Action Required?**

Answer "Yes" if during your inspection you found any of the conditions listed above in the instructions for the Indicators of Pollutant Discharge section. If you answer "Yes," you must take corrective action and complete a corrective action log, found at <https://www.epa.gov/npdes/construction-general-permit-resources-tools-and-templates>. Answer "No" if you did not observe any of the listed pollutant indicators.

### **Photographs**

As required in CGP Part 8.2.1.a, attach photos of: (1) dewatering water prior to treatment by a dewatering control(s) and the final discharge after treatment; (2) the dewatering control(s); and (3) the point of discharge to any receiving waters flowing through or immediately adjacent to the site and/or to constructed or natural site drainage features, storm drain inlets, and other conveyances to receiving waters.

### **Instructions for Section B**

Each inspection report must be signed and certified to be considered complete (CGP Part 4.7.2).

### **Operator or "Duly Authorized Representative" – MANDATORY (CGP Appendix G Part G.11.2 and CGP Appendix H Section X)**

At a minimum, the dewatering inspection report must be signed by either (1) the person who signed the NOI, or (2) a duly authorized representative of that person. The following requirements apply:

If the signatory will be the person who signed the NOI for permit coverage, as a reminder, that person must be one of the following types of individuals:

- *For a corporation:* By a responsible corporate officer. For the purpose of this subsection, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
- *For a partnership or sole proprietorship:* By a general partner or the proprietor, respectively.

- *For a municipality, State, Federal, or other public agency:* By either a principal executive officer or ranking elected official. For purposes of this subsection, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrator of EPA).

If the signatory will be a duly authorized representative, the following requirements must be met:

- The authorization is made in writing by the person who signed the NOI (see above);
- The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position); and
- The signed and dated written authorization is included in the SWPPP. A copy must be submitted to EPA, if requested.

Sign, date and print your name and affiliation.

#### **Contractor or Subcontractor - OPTIONAL**

Where you rely on a contractor or subcontractor to complete the dewatering inspection report, you should consider requiring the individual(s) to sign and certify each report. Note that this does not relieve you, the permitted operator, of the requirement to sign and certify the dewatering inspection report as well. If applicable, sign, date, and print your name and affiliation.

#### **Note**

While EPA has made every effort to ensure the accuracy of all instructions contained in this template, it is the permit, not this template, that determines the actual obligations of regulated construction stormwater discharges. In the event of a conflict between this template and any corresponding provision of the CGP, you must abide by the requirements in the permit. EPA welcomes comments on this Dewatering Inspection Report Template at any time and will consider those comments in any future revision. You may contact EPA for CGP-related inquiries at [cgp@epa.gov](mailto:cgp@epa.gov)

APPENDIX E  
Corrective Action Log

# 2022 CGP Corrective Action Log

Project Name: \_\_\_\_\_

NPDES ID Number: \_\_\_\_\_

Section A – Individual Completing this Log	
Name:	Title:
Company Name:	Email:
Address:	Phone Number:
Section B – Details of the Problem (CGP Part 5.4.1.a)	
Complete this section <u>within 24 hours</u> of discovering the condition that triggered corrective action.	
Date problem was first identified:	Time problem was first identified:
What site conditions triggered this corrective action? <i>(Check the box that applies. See instructions for a description of each triggering condition (1 thru 6).)</i>	
<input type="checkbox"/> 1 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5a <input type="checkbox"/> 5b <input type="checkbox"/> 6	
Specific location where problem identified:	
Provide a description of the specific condition that triggered the need for corrective action and the cause (if identifiable):	
Section C – Corrective Action Completion (CGP Part 5.4.1.b)	
Complete this section <u>within 24 hours</u> after completing the corrective action.	
For site condition # 1, 2, 3, 4, or 6 (those not related to a dewatering discharge) confirm that you met the following deadlines (CGP Part 5.2.1):	
<input type="checkbox"/> Immediately took all reasonable steps to address the condition, including cleaning up any contaminated surfaces so the material will not discharge in subsequent storm events. <b>AND</b>	
<input type="checkbox"/> Completed corrective action by the close of the next business day, unless a new or replacement control, or significant repair, was required. <b>OR</b>	
<input type="checkbox"/> Completed corrective action within seven (7) calendar days from the time of discovery because a new or replacement control, or significant repair, was necessary to complete the installation of the new or modified control or complete the repair. <b>OR</b>	
<input type="checkbox"/> It was infeasible to complete the installation or repair within 7 calendar days from the time of discovery. Provide the following additional information:  Explain why 7 calendar days was infeasible to complete the installation or repair:	

Provide your schedule for installing the stormwater control and making it operational as soon as feasible after the 7 calendar days:

**For site condition # 5a, 5b, or 6 (those related to a dewatering discharge), confirm that you met the following deadlines:**

- Immediately took all reasonable steps to minimize or prevent the discharge of pollutants until a solution could be implemented, including shutting off the dewatering discharge as soon as possible depending on the severity of the condition taking safety considerations into account.
- Determined whether the dewatering controls were operating effectively and whether they were causing the conditions.
- Made any necessary adjustments, repairs, or replacements to the dewatering controls to lower the turbidity levels below the benchmark or remove the visible plume or sheen.

Describe any modification(s) made as part of corrective action: (Insert additional rows below if applicable)	Date of completion:	SWPPP update necessary?	If yes, date SWPPP was updated:
1.		<input type="checkbox"/> Yes <input type="checkbox"/> No	
2.		<input type="checkbox"/> Yes <input type="checkbox"/> No	

**Section D - Signature and Certification (CGP Part 5.4.2)**

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information contained therein. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information contained is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

**MANDATORY: Signature of Operator or "Duly Authorized Representative:"**

<b>Signature:</b>	<b>Date:</b>
<b>Printed Name:</b>	<b>Affiliation:</b>

**OPTIONAL: Signature of Contractor or Subcontractor**

<b>Signature:</b>	<b>Date:</b>
<b>Printed Name:</b>	<b>Affiliation:</b>

## **General Instructions**

This Corrective Action Log Template is provided to assist you creating a corrective action log that complies with the minimum reporting requirements of Part 5.4 of the EPA's Construction General Permit (CGP). For each triggering condition on your site, you will need to fill out a separate corrective action log.

The entire form must be completed to be compliant with the requirements of the permit. (Note: In Section C, if you do not need the number of rows provided in the corrective action log, you may delete these or cross them off. Alternatively, if you need more space to describe any modifications, you may insert additional rows in the electronic version of this form or use the bottom of the page in the field version of this form.)

If you are covered under a State CGP, this template may be helpful in developing a log that can be used for that permit; however, you will likely need to modify this form to meet the specific requirements of any State-issued permit. If your permitting authority requires you to use a specific corrective action log, you should not use this template.

## **Instructions for Section A**

**Individual completing this form** Enter the name of the person completing this log. Include the person's contact information (title, affiliated company name, address, email, and phone number).

## **Instructions for Section B**

You must complete Section B within 24 hours of discovering the condition that triggered corrective action. (CGP Part 5.4)

### **When was the problem first discovered?**

Specify the date and time when the triggering condition was first discovered.

### **What site conditions triggered this corrective action? (CGP Parts 5.1 and 5.3)**

Check the box corresponding to the numbered triggering condition below that applies to your site.

1. A stormwater control needs a significant repair or a new or replacement control is needed, or, in accordance with Part **Error! Reference source not found.**, you find it necessary to repeatedly (i.e., 3 or more times) conduct the same routine maintenance fix to the same control at the same location (unless you document in your inspection report under Part **Error! Reference source not found.** that the specific reoccurrence of this same problem should still be addressed as a routine maintenance fix under Part **Error! Reference source not found.**);
2. A stormwater control necessary to comply with the requirements of this permit was never installed, or was installed incorrectly;
3. Your discharges are not meeting applicable water quality standards;
4. A prohibited discharge has occurred (see Part 1.3);
5. During discharge from site dewatering activities:
  - a. The weekly average of your turbidity monitoring results exceeds the 50 NTU benchmark (or alternate benchmark if approved by EPA pursuant to Part **Error! Reference source not found.**); or
  - b. You observe or you are informed by EPA, State, or local authorities of the presence of any of the following at the point of discharge to a receiving water flowing through or immediately adjacent to your site and/or to constructed or natural site drainage features or storm drain inlets:
    - sediment plume
    - suspended solids
    - unusual color
    - presence of odor
    - decreased clarity
    - presence of foam
    - visible sheen on the water surface or visible oily deposits on the bottom or shoreline of the receiving water
6. EPA requires corrective action as a result of permit violations found during an inspection carried out under Part 4.8.

**Provide a description of the problem** (CGP Part 5.4.1.a)

Provide a summary description of the condition you found that triggered corrective action, the cause of the problem (if identifiable), and the specific location where it was found. Be as specific as possible about the location; it is recommended that you refer to a precise point on your site map.

**Instructions for Section C**

You must complete Section C within 24 hours after completing the correction action. (CGP Part 5.4)

**Deadlines for completing corrective action for condition # 1, 2, 3, 4, or 6 (if not relating to a dewatering discharge)** (CGP Part 5.2.1)

Check the box to confirm that you met the deadlines that apply to each triggering condition. You are always required to check the first box (i.e., Immediately took all reasonable steps to address the condition, including cleaning up any contaminated surfaces so the material will not discharge in subsequent storm events.). Only one of the next three boxes should be checked depending on the situation that applies to this corrective action.

Check the second box if the corrective action for this particular triggering condition does not require a new or replacement control, or a significant repair. These actions must be completed by the close of the next business day from the time of discovery of the condition.

Check the third box if the corrective action for this particular triggering condition requires a new or replacement control, or a significant repair. These actions must be completed by no later than seven calendar days from the time of discover of the condition.

Check the fourth box if the corrective action for this particular triggering condition requires a new or replacement control, or a significant repair, and if it is infeasible to complete the work within seven calendar days. Additionally, you will need to fill out the table below the checkbox that requires:

1. An explanation as to why it was infeasible to complete the installation or repair within seven calendar days of discovering the condition.
2. Provide the schedule you will adhere to for installing the stormwater control and making it operational as soon as feasible after the seventh day following discovery.

Note: Per Part 5.2.1.c, where these actions result in changes to any of the stormwater controls or procedures documented in your SWPPP, you must modify your SWPPP accordingly within seven calendar days of completing this work.

**Deadlines for completing corrective action for condition # 5a, 5b, or 6 related to a dewatering discharge** (CGP Part 5.2.2)

These deadlines apply to conditions relating to construction dewatering activities. Check the box to confirm that you met the deadlines that apply to each triggering condition. You are required to check all of the boxes in this section to indicate your compliance with the corrective action deadlines.

**List of modification(s) to correct problem**

Provide a list of modifications you completed to correct the problem.

**Date of completion**

Enter the date you completed the modification. The work must be completed by the deadline you indicated above.

**SWPPP update necessary?**

Check "Yes" or "No" to indicate if a SWPPP update is necessary consistent with Part 7.4.1.a in order to reflect changes implemented at your site. If "Yes," then enter the date you updated your SWPPP. The SWPPP updates must be made within seven calendar days of completing a corrective action. (CGP Part 5.2.1.c)

**Instructions for Section D**

Each corrective action log entry must be signed and certified following completion of Section D to be considered complete. (CGP Part 5.4.2)

**Operator or "Duly Authorized Representative" – MANDATORY** (CGP Appendix G Part G.11.2 and CGP Appendix H Section X)

At a minimum, the corrective action log must be signed by either (1) the person who signed the NOI, or (2) a duly authorized representative of that person. The following requirements apply:

If the signatory will be the person who signed the NOI for permit coverage, as a reminder, that person must be one of the following types of individuals:

- *For a corporation:* By a responsible corporate officer. For the purpose of this subsection, a responsible corporate officer means: (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
- *For a partnership or sole proprietorship:* By a general partner or the proprietor, respectively.
- *For a municipality, State, Federal, or other public agency:* By either a principal executive officer or ranking elected official. For purposes of this subsection, a principal executive officer of a Federal agency includes (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrator of EPA).

If the signatory will be a duly authorized representative, the following requirements must be met:

- The authorization is made in writing by the person who signed the NOI (see above);
- The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position); and
- The signed and dated written authorization is included in the SWPPP. A copy must be submitted to EPA, if requested.

Sign, date and print your name and affiliation.

#### **Contractor or Subcontractor - OPTIONAL**

Where you rely on a contractor or subcontractor to complete this log and the associated corrective action, you should consider requiring the individual(s) to sign and certify each log entry. Note that this does not relieve you, the permitted operator, of the requirement to sign and certify the log as well. If applicable, sign, date, and print your name and affiliation.

#### **Recordkeeping**

Logs must be retained for at least 3 years from the date your permit coverage expires or is terminated. (CGP Part 5.4.4)

Keep copies of your signed corrective action log entries at the site or at an easily accessible location so that it can be made immediately available at the time of an on-site inspection or upon request by EPA. (CGP Part 5.4.3) Include a copy of the corrective action log in your SWPPP. (CGP Part 7.2.7.e)

#### **Note**

While EPA has made every effort to ensure the accuracy of all instructions contained in this template, it is the permit, not this template, that determines the actual obligations of regulated construction stormwater discharges. In the event of a conflict between this template and any corresponding provision of the CGP, you must abide by the requirements in the permit. EPA welcomes comments on this Corrective Action Log Template at any time and will consider those comments in any future revision. You may contact EPA for CGP-related inquiries at [cgp@epa.gov](mailto:cgp@epa.gov)

DRAFT

APPENDIX F  
SWPPP Amendment Log

**Appendix F –SWPPP Amendment Log**

**Instructions (see CGP Part 7.4):**

- Create a log here of changes and updates to the SWPPP. You may use the table below to track these modifications.
- SWPPP modifications are required pursuant to CGP Part 7.4.1 in the following circumstances:
  - ✓ Whenever new operators become active in construction activities on your site, or you make changes to your construction plans, stormwater controls, or other activities at your site that are no longer accurately reflected in your SWPPP (this includes changes made in response to corrective actions triggered under CGP Part 5);
  - ✓ To reflect areas on your site map where operational control has been transferred (and the date of transfer) since initiating permit coverage;
  - ✓ If inspections or investigations determine that SWPPP modifications are necessary for compliance with this permit;
  - ✓ Where EPA determines it is necessary to install and/or implement additional controls at your site in order to meet requirements of the permit;
  - ✓ To reflect any revisions to applicable Federal, State, Tribal, or local requirements that affect the stormwater control measures implemented at the site; and
  - ✓ If applicable, if a change in chemical treatment systems or chemically-enhanced stormwater control is made, including use of a different treatment chemical, different dosage rate, or different area of application.

**Appendix G – Subcontractor Certifications/Agreements**

SUBCONTRACTOR CERTIFICATION  
STORMWATER POLLUTION PREVENTION PLAN

Project Number: \_\_\_\_\_

Project Title: Wells 2, 3 And 4 Water Treatment Plant

Operator(s): \_\_\_\_\_

As a subcontractor, you are required to comply with the Stormwater Pollution Prevention Plan (SWPPP) for any work that you perform on-site. Any person or group who violates any condition of the SWPPP may be subject to substantial penalties or loss of contract. You are encouraged to advise each of your employees working on this project of the requirements of the SWPPP. A copy of the SWPPP is available for your review at the office trailer.

Each subcontractor engaged in activities at the construction site that could impact stormwater must be identified and sign the following certification statement:

**I certify under the penalty of law that I have read and understand the terms and conditions of the SWPPP for the above designated project and agree to follow the practices described in the SWPPP.**

This certification is hereby signed in reference to the above named project:

Company: \_\_\_\_\_

Address: \_\_\_\_\_

Telephone Number: \_\_\_\_\_

Type of construction service to be provided: \_\_\_\_\_

## APPENDIX I

### Training Documentation

*(Include documentation showing completion of trainings in accordance with Section 1.2 of the SWPPP and section 7.2.2 of the CGP)*

APPENDIX J  
Delegation of Authority

**Appendix J –Delegation of Authority Form**

Delegation of Authority

I, \_\_\_\_\_ (name), hereby designate the person or specifically described position below to be a duly authorized representative for the purpose of overseeing compliance with environmental requirements, including the EPA's Construction General Permit (CGP), at the \_\_\_\_\_ construction site. The designee is authorized to sign any reports, stormwater pollution prevention plans and all other documents required by the permit.

\_\_\_\_\_ (name of person or position)  
\_\_\_\_\_ (company)  
\_\_\_\_\_ (address)  
\_\_\_\_\_ (city, State, zip)  
\_\_\_\_\_ (phone)

By signing this authorization, I confirm that I meet the requirements to make such a designation as set forth in Appendix G of EPA's CGP, and that the designee above meets the definition of a "duly authorized representative" as set forth in Appendix G.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I have no personal knowledge that the information submitted is other than true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Project Name: Sharon Well 4 Treatment System

February 13, 2023

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

*Updated 12/27/2022 - Please review this letter each time you request an Official Species List, we will continue to update it with additional information and links to websites may change.*

### **About Official Species Lists**

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Federal and non-Federal project proponents have responsibilities under the Act to consider effects on listed species.

The enclosed species list identifies threatened, endangered, proposed, and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested by returning to an existing project's page in IPaC.

### **Endangered Species Act Project Review**

Please visit the “**New England Field Office Endangered Species Project Review and Consultation**” website for step-by-step instructions on how to consider effects on listed

DRAFT

species and prepare and submit a project review package if necessary:

<https://www.fws.gov/office/new-england-ecological-services/endangered-species-project-review>

**\*NOTE\*** Please do not use the **Consultation Package Builder** tool in IPaC except in specific situations following coordination with our office. Please follow the project review guidance on our website instead and reference your **Project Code** in all correspondence.

**Northern Long-eared Bat - (Updated 12/27/2022)** Please visit our New England Field Office Project Review webpage at the link above for updated northern long-eared bat consultation guidance. The Service published a final rule to reclassify the northern long-eared bat (NLEB) as endangered on November 30, 2022. The final rule will go into effect on **January 30, 2023**. After that date, the current 4(d) rule for NLEB will no longer be in effect, and the 4(d) determination key will no longer be available. New compliance tools will be available by mid- to late-January, and information will be posted on our New England Field Office Project Review webpage in January, so please check this site often for updates.

Depending on the type of effects a project has on NLEB, the change in the species' status may trigger the need to re-initiate consultation for any actions that are not completed and for which the Federal action agency retains discretion once the new listing determination becomes effective. If your project may result in incidental take of NLEB after the new listing goes into effect, this will need to be addressed in an updated consultation that includes an Incidental Take Statement. Many of these situations will be addressed through the new compliance tools. If your project may require re-initiation of consultation, please wait for information on the new tools to appear on our website or contact our office at **newengland@fws.gov** for additional guidance.

#### *Additional Info About Section 7 of the Act*

Under section 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to determine whether projects may affect threatened and endangered species and/or designated critical habitat. If a Federal agency, or its non-Federal representative, determines that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Federal agency also may need to consider proposed species and proposed critical habitat in the consultation. 50 CFR 402.14(c)(1) specifies the information required for consultation under the Act regardless of the format of the evaluation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

<https://www.fws.gov/service/section-7-consultations>

In addition to consultation requirements under Section 7(a)(2) of the ESA, please note that under sections 7(a)(1) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species. Please contact NEFO if you would like more information.

**Candidate species** that appear on the enclosed species list have no current protections under the

ESA. The species' occurrence on an official species list does not convey a requirement to consider impacts to this species as you would a proposed, threatened, or endangered species. The ESA does not provide for interagency consultations on candidate species under section 7, however, the Service recommends that all project proponents incorporate measures into projects to benefit candidate species and their habitats wherever possible.

### **Migratory Birds**

In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see:

<https://www.fws.gov/program/migratory-bird-permit>

<https://www.fws.gov/library/collections/bald-and-golden-eagle-management>

Please feel free to contact us at **newengland@fws.gov** with your **Project Code** in the subject line if you need more information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat.

## Project Summary

Project Code: 2023-0044951

Project Name: Sharon Well 4 Treatment System

Project Type: Water Supply Facility - New Constr

Project Description: The project includes the construction of a new water treatment facility for PFAS removal at an existing municipal well site in Sharon, MA. The project also includes a water main extension approximately 1-mile in length from a nearby well-site to the proposed treatment facility.

Project Location:

Approximate location of the project can be viewed in Google Maps: <https://www.google.com/maps/@42.1238397,-71.18842996193376,14z>

Counties: Norfolk County, Massachusetts

## Endangered Species Act Species

There is a total of 2 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries<sup>1</sup>, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

- 
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

### Mammals

NAME	STATUS

DRAFT

species and prepare and submit a project review package if necessary:

<https://www.fws.gov/office/new-england-ecological-services/endangered-species-project-review>

**\*NOTE\*** Please do not use the **Consultation Package Builder** tool in IPaC except in specific situations following coordination with our office. Please follow the project review guidance on our website instead and reference your **Project Code** in all correspondence.

**Northern Long-eared Bat - (Updated 4/12/2023)** The Service published a final rule to reclassify the northern long-eared bat (NLEB) as endangered on November 30, 2022. The final rule went into effect on March 31, 2023. You may utilize the **Northern Long-eared Bat Rangewide Determination Key** available in IPaC. More information about this Determination Key and the Interim Consultation Framework are available on the northern long-eared bat species page:

<https://www.fws.gov/species/northern-long-eared-bat-myotis-septentrionalis>

For projects that previously utilized the 4(d) Determination Key, the change in the species' status may trigger the need to re-initiate consultation for any actions that are not completed and for which the Federal action agency retains discretion once the new listing determination becomes effective. If your project was not completed by March 31, 2023, and may result in incidental take of NLEB, please reach out to our office at [newengland@fws.gov](mailto:newengland@fws.gov) to see if reinitiation is necessary.

#### *Additional Info About Section 7 of the Act*

Under section 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to determine whether projects may affect threatened and endangered species and/or designated critical habitat. If a Federal agency, or its non-Federal representative, determines that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Federal agency also may need to consider proposed species and proposed critical habitat in the consultation. 50 CFR 402.14(c)(1) specifies the information required for consultation under the Act regardless of the format of the evaluation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

<https://www.fws.gov/service/section-7-consultations>

In addition to consultation requirements under Section 7(a)(2) of the ESA, please note that under sections 7(a)(1) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species. Please contact NEFO if you would like more information.

**Candidate species** that appear on the enclosed species list have no current protections under the ESA. The species' occurrence on an official species list does not convey a requirement to

consider impacts to this species as you would a proposed, threatened, or endangered species. The ESA does not provide for interagency consultations on candidate species under section 7, however, the Service recommends that all project proponents incorporate measures into projects to benefit candidate species and their habitats wherever possible.

### **Migratory Birds**

In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see:

<https://www.fws.gov/program/migratory-bird-permit>

<https://www.fws.gov/library/collections/bald-and-golden-eagle-management>

Please feel free to contact us at **newengland@fws.gov** with your **Project Code** in the subject line if you need more information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat.

**Criterion C Eligibility Requirements**

**C** **Discharges not likely to result in any short- or long-term adverse effects to ESA-listed species and/or designated critical habitat.** ESA-listed species and/or designated critical habitat(s) under the jurisdiction of the USFWS and/or NMFS are likely to occur in or near your site's "action area," and you certify to EPA that your site's discharges and discharge-related activities are not likely to result in any short- or long-term adverse effects to ESA-listed threatened or endangered species and/or designated critical habitat. This certification may include consideration of any stormwater controls and/or management practices you will adopt to ensure that your discharges and discharge-related activities are not likely to result in any short- or long-term adverse effects to ESA-listed species and/or designated critical habitat. To certify your eligibility under this criterion, you must indicate below 1) the ESA-listed species and/or designated habitat located in your "action area" using the process outlined in this Appendix; 2) the distance between the site and the listed species and/or designated critical habitat in the action area (in miles); and 3) a rationale describing specifically how short- or long-term adverse effects to ESA-listed species will be avoided from the discharges and discharge-related activities. You must also include a copy of your site map from your SWPPP showing the upland and in-water extent of your "action area" with your NOI.

**C1.** I confirm that both ESA-listed species and designated critical habitat under the jurisdiction of the USFWS and/or NMFS were considered in my evaluation. Yes

**C2.** Provide the USFWS information resources and expertise used to arrive at this criterion selection:

**C3.** Provide the NMFS information resources and expertise used to arrive at this criterion selection:

**C4.** What ESA-listed species and/or designated critical habitat are located in your “action area?” (or attach a printout of the species’ list(s))

**C5.** What is the distance between your site and the ESA-listed species and/or designated critical habitat within the action area (in miles, state “on site” if the ESA-listed species and/or designated critical habitat is within the area to be disturbed)? \_\_\_\_\_

**C6.** Provide the rationale describing specifically how any short- or long-term adverse effects to ESA-listed species will be avoided from the discharge and discharge-related activities.

**C7.** I confirm that a site map from my SWPPP showing the upland and in-water extent of my “action area” is attached. Yes

**C8.** Check to confirm you have provided documentation in your SWPPP supporting your eligibility under Criterion C. Yes

**Instructions**

- > **If you selected Criterion C above and answered questions C1-C8, you are done with this worksheet. If you are not filing electronically, you must submit this worksheet with your NOI.**
- > If not, please proceed to step 4.

Agency license or funding for the project (list all licenses, permits, approvals, grants or other entitlements being sought from state and federal agencies).

*XC: MAJOR PROJECT, DEP. STATE HISTORICAL COMMISSION, ENVIRONMENTAL PARTNERS*

Agency Name

Type of License or funding (specify)

Refer to the Attached License/Funding List

Project Description (narrative):

The project consists of the construction of a water treatment plant at the 15 Tree Lane site, the existing site of Well 4. Site improvements include the construction of an access road, a building (7,500 square feet), infiltration basins to attenuate stormwater, and new water main piping to connect the well sites to the new treatment facility.

Does the project include demolition? If so, specify nature of demolition and describe the building(s) which are proposed for demolition.

This project includes the possible demolition of the existing chemical building located south of the proposed WTP, as the building will no longer be needed following construction of the proposed facility.

Does the project include rehabilitation of any existing buildings? If so, specify nature of rehabilitation and describe the building(s) which are proposed for rehabilitation.

Yes, the project includes rehabilitation of existing water treatment equipment and support systems. The existing chemical equipment will be removed at all well sites. Hazardous material assessments will also be conducted to determine whether additional rehabilitation is needed.

Does the project include new construction? If so, describe (attach plans and elevations if necessary).

Yes, the project includes the construction of a new water treatment plant. Refer to Figure 3 for a preliminary design plan.

950 CMR: OFFICE OF THE SECRETARY OF THE COMMONWEALTH

APPENDIX A (continued)

To the best of your knowledge, are any historic or archaeological properties known to exist within the project's area of potential impact? If so, specify.

No.

What is the total acreage of the project area?

Woodland ±3.1 acres  
Wetland ±0.9 acres  
Floodplain ±1.6 acres  
Open space 0 acres  
Developed ±0.7 acres

Productive Resources:  
Agriculture \_\_\_\_\_ acres  
Forestry \_\_\_\_\_ acres  
Mining/Extraction \_\_\_\_\_ acres  
Total Project Acreage 6.3 acres

What is the acreage of the proposed new construction? 0.17 acres (building only)

What is the present land use of the project area?

The project area is adjacent to an existing paved right-of-way and is currently undeveloped (wooded).

Please attach a copy of the section of the USGS quadrangle map which clearly marks the project location.

Please refer to the attached Figure 1 and Figure 2.

APPENDIX N  
Turbidity Meter Manual and Manufacturer's Instructions

This SWPPP does not list the Beaver Brook as “sensitive waters” (which are (1) receiving waters listed as impaired for sediment or a sediment-related parameter per Appendix A of the CGP and (2) receiving waters designated as a Tier 2, 2.5, or 3).

The EPA’s Stormwater Discharge Mapping Tools found at <https://www.epa.gov/npdes/epas-stormwater-discharge-mapping-tools> have been used to confirm the point of discharge and designation of the sediment receiving water.

FOR CONSTRUCTION

# GENERAL NOTES

- BASEMAP INFORMATION PROVIDED IS FROM A SURVEY PERFORMED BY ZENITH LAND SURVEYORS, LLC IN 2022 AND 2023 SUPPLEMENTED BY RECORD INFORMATION PROVIDED BY THE TOWN OF SHARON DEPARTMENT OF PUBLIC WORKS. THE BASIS OF BEARING FOR ALL SURVEYS IS AN APPROXIMATED NORTH AMERICAN VERTICAL DATUM OF 1988 (NAV88) AND THE HORIZONTAL DATUM USED IS THE NORTH AMERICAN DATUM OF 1983 (NAD83).
- BASEMAP INFORMATION ON SHEETS W-4 AND W-5 ARE FROM MASSGIS AND LIDAR AND NOT FIELD SURVEYED. WETLAND DELINEATION IS FROM MASSGIS.
- EXISTING GAS, ELECTRIC, TELEPHONE, AND CABLE/TELEVISION UTILITY INFORMATION SHOWN ON ALL SHEETS IS TAKEN FROM RECORD INFORMATION SUPPLIED BY THE UTILITY PROVIDER. IT IS NOTED THAT ADDITIONAL UTILITY PIPES, WIRES, AND STRUCTURES MAY EXIST.
- WETLAND RESOURCE AREA DELINEATION FLAGGED BY ENVIRONMENTAL CONSULTING & RESTORATION, LLC ON APRIL 27, 2022 AND FIELD LOCATED BY ZENITH LAND SURVEYORS, LLC AS PART OF THE SITE SURVEY.
- IN AREAS WHERE CONSTRUCTION ACTIVITIES ARE ANTICIPATED TO OCCUR ADJACENT TO PRIVATE PROPERTY, PROPERTY LINE LOCATIONS ARE TO BE REVIEWED WITH THE TOWN OF SHARON PRIOR TO COMMENCING CONSTRUCTION ACTIVITIES.
- THE CONTRACTOR SHALL NOT STORE ANY APPARATUS, MATERIALS, SUPPLIES, OR EQUIPMENT ON DRAINAGE STRUCTURES, PRIVATE PROPERTY OR WITHIN 100 FEET OF WETLANDS OR 200 FEET OF MEAN HIGH WATER, UNLESS DIRECTED TO DO SO BY THE CONTRACT DOCUMENTS.
- NORTH DIRECTION SHOWN IS APPROXIMATE.
- THE CONTRACTOR SHALL RESTORE ALL PUBLIC AND PRIVATE PROPERTY TO ITS PRE-CONSTRUCTION CONDITION AT NO ADDITIONAL COST TO THE OWNER.
- THE CONTRACTOR SHALL PROVIDE ALL MATERIAL, LABOR, EQUIPMENT, AND APPURTENANCES NECESSARY TO COMPLETE ALL THE WORK OF THIS CONTRACT. AS OUTLINED ON THESE PLANS, AND FURNISH A COMPLETE JOB, IN ACCORDANCE WITH ALL LOCAL, STATE AND FEDERAL GOVERNING AUTHORITIES HAVING LAWFUL JURISDICTION OVER THE WORK. ADEQUATE PROTECTION OF PERSONS AND PROPERTY SHALL BE PROVIDED AT ALL TIMES AND THE WORK SHALL BE EXECUTED IN SUCH A WAY AS TO AVOID HAZARD TO PERSONS AND PROPERTY.
- ALL STRUCTURES AND PIPELINES LOCATED ADJACENT TO THE TRENCH EXCAVATION SHALL BE PROTECTED AND FIRMLY SUPPORTED BY THE CONTRACTOR UNTIL THE TRENCH IS BACKFILLED. INJURY TO ANY SUCH STRUCTURE CAUSED BY, OR RESULTING FROM, THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED AT THE CONTRACTOR'S EXPENSE. ALL UTILITIES REQUIRING REPAIR, RELOCATION, OR ADJUSTMENT AS A RESULT OF THE PROJECT SHALL BE COORDINATED THROUGH THE RESPECTIVE UTILITY AND THE TOWN.
- ALL DEMOLISHED MATERIALS SHALL BE REMOVED FROM THE SITE AND LEGALLY DISPOSED.
- THE CONTRACTOR IS TO TAKE SPECIAL CARE NOT TO DAMAGE TREES, BUSHES, PLANTS, FLOWERS, STONEWALLS, FENCES, ETC. WITHIN THE CONSTRUCTION AREA UNLESS THEY ARE NOTED TO BE REMOVED. CONTRACTOR SHALL REPLACE ALL DAMAGED ITEMS AT NO COST TO OWNER.
- THE CONTRACTOR SHALL REMOVE AND LEGALLY DISPOSE OF ALL CONSTRUCTION AND DEMOLITION MATERIALS, EQUIPMENT, AND OTHER DEBRIS AS A RESULT OF CONSTRUCTION WORK, AND SHALL RESTORE THE SITE TO A NEAT AND ORDERLY CONDITION.
- THE CONTRACTOR SHALL INSTALL AND MAINTAIN TRAFFIC CONTROL DEVICES AS NECESSARY AND IN ACCORDANCE WITH THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES. CONTRACTOR SHALL REMOVE AND REPLACE, OR REPAIR, ALL CURBS, SIDEWALKS, PAVEMENT AND OTHER ITEMS DAMAGED BY HIS CONSTRUCTION ACTIVITIES TO AT LEAST THEIR ORIGINAL CONDITION, AND TO THE SATISFACTION OF THE TOWN OF SHARON AND ENGINEER.
- ANY TRAFFIC SIGNAL EQUIPMENT (LIGHTS, CONDUITS, LOOP DETECTORS) DISTURBED SHALL BE REPAIRED OR REPLACED BY THE CONTRACTOR AS DIRECTED BY THE TOWN AT THE CONTRACTOR'S EXPENSE.
- THE CONTRACTOR IS RESPONSIBLE FOR SECURING SITE STORAGE AND LAYDOWN AREAS FOR PIPES, SUPPLIES, MATERIALS, AND EQUIPMENTS. THE LOCATION AND LIMITS OF ALL ON-SITE WORK AND STORAGE AREAS SHALL BE REVIEWED/COORDINATED WITH, AND ACCEPTABLE TO, THE TOWN OF SHARON. THE CONTRACTOR SHALL LIMIT THEIR ACTIVITIES TO THESE AREAS.
- AT THE WELL STATION 4 AND WATER TREATMENT PLANT SITE, INGRESS AND EGRESS SHALL BE LIMITED TO TREE LANE; NO INGRESS OR EGRESS FROM PINE GROVE AVENUE SHALL BE ALLOWED.
- ELEVATIONS OF EXISTING STRUCTURES ARE BASED ON INFORMATION OBTAINED FROM AVAILABLE DRAWINGS AND RECORDS. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING ALL ELEVATIONS, DIMENSIONS, ANGLES AND EXISTING CONDITIONS AT THE WORK SITE PRIOR TO FABRICATION AND/OR INSTALLATION OF ANY WORK IN THE CONTRACT AREA.
- THE CONTRACTOR SHALL HANDLE GROUNDWATER, WHERE ENCOUNTERED, IN AN APPROVED MANNER. DURING ANY DEWATERING, THE CONTRACTOR SHALL USE STONE AROUND THE SUCTION END TO MINIMIZE DISCHARGE OF TRENCH MATERIALS. THE DISCHARGED WATER SHALL PASS THROUGH A DEWATERING BAG.
- ALL EXISTING UTILITIES SHOWN ARE APPROXIMATE, THE CONTRACTOR SHALL VERIFY THE LOCATION OF ALL EXISTING UTILITIES PRIOR TO THE START OF WORK. CONTRACTOR SHALL NOTIFY DIG SAFE AT LEAST 72 HOURS IN ADVANCE, EXCLUDING WEEKENDS AND HOLIDAYS, PRIOR TO ANY EXCAVATION. TEST PITS TO LOCATE EXISTING UTILITIES MAY BE ORDERED BY THE ENGINEER.
- THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE SUPPORT OF ALL UTILITIES AND STRUCTURES DURING CONSTRUCTION.

- THE CONTRACTOR IS ADVISED TO TAKE ALL PRECAUTIONS AND MAKE ALL INVESTIGATIONS NECESSARY TO PERFORM THE WORK. THE OWNER WILL NOT CONSIDER CONTRACTOR'S UNFAMILIARITY WITH THE PROJECT OR SITE CONDITIONS AT THE TIME OF BID AS A BASIS FOR ADDITIONAL COMPENSATION.
- IN THOSE INSTANCES WHERE POWER OR TELEPHONE POLE SUPPORT IS REQUIRED, THE CONTRACTOR SHALL PROVIDE A MINIMUM 48-HOUR NOTIFICATION TO THE RESPECTIVE UTILITY COMPANY. NO ADDITIONAL PAYMENT WILL BE PROVIDED FOR TEMPORARY BRACING OF UTILITIES.
- THE CONTRACTOR SHALL MAKE ALL REQUIRED FIELD MEASUREMENTS TO VERIFY EXISTING AND CONTRACT INTERFACE DIMENSIONS, LOCATIONS, AND OTHER CONDITIONS.
- ALL DIMENSIONS AND QUANTITIES SHALL BE DETERMINED OR VERIFIED BY THE CONTRACTOR.
- DO NOT SCALE DRAWINGS UNLESS OTHERWISE NOTED. WRITTEN DIMENSION AND STATIONING SHALL PREVAIL. REPORT ANY DISCREPANCIES TO THE ENGINEER IMMEDIATELY.
- THE TOWN OF SHARON REQUIRES ONE WEEK ADVANCED NOTICE TO PROVIDE UTILITY LOCATION SERVICES.
- ALL OPEN TRENCHES MUST BE BACK FILLED AT THE END OF THE WORKDAY OR COVERED AND SECURED WITH STEEL PLATES, RAMPED AS APPROVED BY THE ENGINEER AND TOWN. STEEL PLATES MAY ONLY BE USED FOR 24-HOUR INCREMENTS AT THE SAME LOCATION. STEEL PLATES SHALL NOT BE USED DURING WEEKENDS OR HOLIDAYS. NO EXCEPTIONS SHALL BE PERMITTED.
- ALL AREAS DISTURBED BY THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED IN KIND AT NO COST TO THE OWNER, TO THE SATISFACTION OF THE OWNER/ENGINEER.
- THE CONTRACTOR SHALL RESTORE ALL AREAS DISTURBED BY THE CONTRACTOR'S WORK, INCLUDING ON PRIVATE PROPERTY, TO ITS PRE-CONSTRUCTION CONDITION.
- THE CONTRACTOR SHALL BE REQUIRED TO FURNISH AND MAINTAIN A TELEPHONE NUMBER WHERE THE CONTRACTOR CAN BE REACHED 24 HOURS A DAY, 7 DAYS A WEEK, UNTIL THE PROJECT HAS REACHED SUBSTANTIAL COMPLETION.
- THE CONTRACTOR SHALL PROVIDE ALL MATERIAL, LABOR AND EQUIPMENT NECESSARY TO COMPLETE WORK ON THIS CONTRACT AS OUTLINED IN THE CONTRACT DOCUMENTS (PLANS AND SPECIFICATIONS) AND FURNISH A COMPLETE JOB.
- THE CONTRACTOR SHALL OBTAIN AND PAY FOR ALL PERMITS AND INSPECTIONS REQUIRED FOR THE EXECUTION OF THIS WORK AND SHALL OBTAIN NECESSARY APPROVAL FROM THE AUTHORITIES THAT HAVE JURISDICTION.
- THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE COMPLETE ADHERENCE TO ALL PROVISIONS AND REQUIREMENTS OF THE CONTRACT DOCUMENTS INCLUDING, BUT NOT LIMITED TO, THE CONTRACT DRAWINGS, THE CONTRACT GENERAL REQUIREMENTS, SPECIAL CONDITIONS AND TECHNICAL SPECIFICATIONS, AND TO ALL PERMITS APPENDED THERETO.
- THE CONTRACTOR SHALL COMPLY WITH ALL APPLICABLE REGULATIONS OF THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA).
- ANY ALTERATIONS REQUIRED ON THESE DRAWINGS DURING CONSTRUCTION SHALL BE APPROVED BY THE ENGINEER PRIOR TO CONSTRUCTION AND RECORDED ON THE AS-BUILT DRAWINGS.
- ANY REQUIRED HAZARDOUS WASTE ABATEMENT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. THE CONTRACTOR SHALL MAKE ARRANGEMENTS FOR LEGAL DISPOSAL OF ALL HAZARDOUS WASTE.
- ALL EQUIPMENT SHALL BE REMOVED FROM THE PROJECT AREA AT THE COMPLETION OF EACH WORK DAY AND STORED IN THE DESIGNATED STAGING AREA OR OTHER APPROVED AREA NEAR BY.
- THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING, SETTING UP, AND REMOVING ALL SIGNAGE, CONES, BARRICADES, BARRELS, AND OTHER TRAFFIC CONTROL DEVICES ON A DAILY BASIS.
- CONTRACTOR SHALL HANDLE, STORE, REMOVE, TRANSPORT AND LEGALLY DISPOSE OF ANY ASBESTOS-CEMENT PIPE AS SHOWN ON THE PLANS IN ACCORDANCE WITH ALL LOCAL, STATE, AND FEDERAL REGULATIONS. ASBESTOS NOTIFICATION FORMS SHALL BE COMPLETED AND SUBMITTED TO THE APPROPRIATE AGENCY/AGENCIES AND COPIES SHALL BE PROVIDED TO THE ENGINEER.
- ALL LEAD SERVICE LINES REQUIRING REPLACEMENT AS PART OF THE CONTRACT MAY NOT BE SHOWN ON THE PLANS. THE WORK WILL BE PAYABLE THROUGH THE APPLICABLE CONTRACT ITEM(S). ANY ENCOUNTERED LEAD SERVICE LINES ON MOOSE HILL PARKWAY MUST BE REPLACED. A LIST OF THE KNOWN LEAD SERVICE LINES TO BE REPLACED IN THE VICINITY OF THE PROJECT AREA ARE AS FOLLOWS:

#16 MOOSE HILL PARKWAY	#41 PINE GROVE AVE
#63 MOOSE HILL PARKWAY	#24 UPLAND ROAD
#67 MOOSE HILL PARKWAY	#42 UPLAND ROAD
#85 MOOSE HILL PARKWAY	#43 UPLAND ROAD
#32 PINE GROVE AVE	#49 UPLAND ROAD
#36 PINE GROVE AVE	#52 UPLAND ROAD
#37 PINE GROVE AVE	

# WATER MAIN NOTES:

- MINIMUM COVER OVER THE PROPOSED WATER MAIN, SERVICES, AND APPURTENANCES SHALL BE 5'-0" UNLESS OTHERWISE NOTED OR DIRECTED BY ENGINEER. WHERE NECESSARY, NEW WATER MAINS SHALL BE INSTALLED AT A GREATER DEPTH TO CLEAR OBSTACLES SHOWN ON THE DRAWINGS AT NO ADDITIONAL COST TO THE OWNER. MINIMUM CLEARANCES TO UTILITIES, AS SHOWN ON THE DRAWINGS, SHALL BE MAINTAINED.
- EXCEPT WHERE OTHERWISE DIRECTED, 12" MINIMUM CLEARANCE SHALL BE PROVIDED BETWEEN THE NEW WATER UTILITY AND OTHER EXISTING UTILITIES WHERE THEY CROSS. WHERE NEW WATER UTILITY PASSES UNDER EXISTING UTILITIES, IT SHALL CROSS WITHOUT THE USE OF BENDS UNLESS OTHERWISE NOTED ON THE PLANS. TYPICAL EXISTING UTILITIES INCLUDE GAS, TELECOM, WATER, STORM DRAIN, ELECTRIC, AND FIBER-OPTIC.
- WATER AND SANITARY SEWER LINES SHALL HAVE A MINIMUM HORIZONTAL SEPARATION OF THEN (10) FEET, A TEN (10) FOOT SEPARATION IS NOT POSSIBLE TO BE PROVIDED THERE MUST BE AT LEAST EIGHTEEN (18) INCHES OF VERTICAL SEPARATION, IT IS PREFERRED THAT WATER MAINS CROSS ABOVE SEWER LINES.
- ALL HYDRANT BRANCHES SHALL HAVE VALVES AS SHOWN ON THE HYDRANT DETAIL.
- THE CONTRACTOR SHALL STAKE OUT ALL HYDRANT LOCATIONS AT LEAST 3 DAYS IN ADVANCE OF INSTALLATION. LOCATION OF ALL HYDRANTS SHALL BE VERIFIED BY THE SHARON FIRE DEPARTMENT, ENGINEER, AND OWNER PRIOR TO DIGGING FOR INSTALLATION.
- TEST PITS TO LOCATE EXISTING UTILITIES MAY BE ORDERED BY THE ENGINEER TO DETERMINE WHETHER TO RAISE OR LOWER THE PROPOSED WATER MAIN TO CLEAR EXISTING UTILITIES OR MEET EXISTING WATER MAINS.
- EXISTING WATER MAINS OR SERVICES SHALL NOT BE ABANDONED WITHOUT THE APPROVAL OF THE OWNER.
- WATER SERVICE SHALL NOT BE INTERRUPTED MORE THAN 4 HOURS WITHOUT PRIOR APPROVAL OF THE OWNER.
- ANY HYDRANT WHICH IS NOT IN SERVICE SHALL BE COVERED WITH A SECURELY FASTENED BURLAP BAG (OR EQUAL).
- THE CONTRACTOR SHALL NOT OPEN OR CLOSE ANY VALVES OR HYDRANTS WHICH HOLD WATER IN THE SYSTEM. THE OWNER WILL, ON 24 HOURS NOTICE FROM THE CONTRACTOR, OPEN AND/OR CLOSE ANY VALVES OR HYDRANTS REQUIRED FOR DRAINING OR ADMITTING WATER TO THE VARIOUS SECTIONS OF THE WATER MAINS.
- SOME WATER SERVICE CONNECTIONS MAY NOT BE SHOWN ON THE DRAWINGS. THE OWNER WILL MARK THE LOCATION OF SUCH CONNECTIONS, PROVIDED THE CONTRACTOR GIVES THE OWNER AT LEAST ONE WEEK ADVANCE NOTICE.
- THE CONTRACTOR IS REQUIRED TO NOTIFY AND COORDINATE WITH THE RESIDENTS ALL WATER MAIN SHUT DOWNS 24 HOURS IN ADVANCE.
- CONCRETE THRUST BLOCKS AND "MEGA-LUG" (OR APPROVED EQUAL) MECHANICAL RESTRAINTS ARE REQUIRED AT FITTINGS, PLUGS, AND HYDRANTS.
- WATER SERVICES SHALL BE INSULATED IN AREAS WHERE CONNECTION TO EXISTING WATER SERVICE IS LESS THAN 4 FEET DEEP.
- VALVE DECOMMISSIONING - CLOSE VALVE, REMOVE AND LEGALLY DISPOSE OF GATE BOX, FILL HOLE, AND PAVE ACCORDING TO TYPICAL TRENCH DETAIL.
- SLEEVES, NIPPLES, AND ACCESSORIES NECESSARY FOR CONNECTIONS BETWEEN EXISTING AND NEW PIPES MAY NOT BE SHOWN IN DETAIL. FURNISH AND INSTALL ITEMS NECESSARY FOR CONNECTING TO EXISTING MAINS AND AS INDICATED ON THE CONTRACT DOCUMENTS.
- HYDRANT DECOMMISSIONING - CUT AND CAP HYDRANT LATERAL, REMOVE EXISTING HYDRANT ASSEMBLY AND DELIVER TO THE SHARON WATER DEPARTMENT. FILL HOLE AND PAVE ACCORDING TO TYPICAL TRENCH DETAIL OR RESTORE LANDSCAPING TO MATCH ADJACENT AREAS AT NO EXPENSE TO THE OWNER.
- CONTRACTOR SHALL REMOVE AND LEGALLY DISPOSE OF ALL MATERIAL REMOVED FROM TRENCH DURING CUTTING AND CAPPING OF EXISTING WATER MAINS.
- ALL HYDRANT LATERALS SHALL CROSS UNDER EXISTING UTILITIES AND WATER MAINS. HYDRANT EXTENSIONS SHALL BE INSTALLED, AS NECESSARY, AT NO ADDITIONAL COST TO THE OWNER.
- PRIOR TO DEMOBILIZATION THE CONTRACTOR SHALL OPERATE EVERY VALVE, HYDRANT, WITH THE RESIDENT PROJECT REPRESENTATIVE PRESENT TO ENSURE PROPER OPERATION.
- ALL WATER MAINS, HYDRANT LATERALS AND SERVICES SHALL BE COVERED WITH PRINTED, DETECTABLE WARNING TAPE INSTALLED AS SHOWN ON THE TRENCH DETAIL AND HYDRANT DETAIL.
- TRENCHES MAY BE SAW CUT OR ZIPPED.
- THE WORK AREA SHALL BE LEFT CLEAN AT THE END OF EACH WORK DAY, INCLUDING BUT NOT LIMITED TO MOTORIZED SWEEPING TO REMOVE LOOSE SOIL, MATERIALS AND ALL OTHER DEBRIS ACCUMULATED ON PAVED SURFACES FROM CONSTRUCTION ACTIVITIES.
- DUST CONTROL SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR.

- TRENCH PAVING SHALL OCCUR EACH FRIDAY AT A MINIMUM, OR PRIOR TO EACH WEEKEND. PAVEMENT SHALL BE PLACED IN ADVANCE OF INCLEMENT CONDITIONS.
- ALL WATER MAIN SHALL BE POLYETHYLENE V-BIO ENCASED.

# CONSERVATION NOTES

- PRIOR TO START OF WORK, AND IF THE PROJECT INVOLVES WORK ADJACENT TO BORDERING VEGETATED WETLAND, THE BOUNDARY OF THE WETLAND IN THE VICINITY OF THE PROPOSED WORK AREA SHALL BE MARKED BY WOODEN STAKES OR FLAGGING. ONCE IN PLACE, THE WETLAND BOUNDARY MARKERS SHALL BE MAINTAINED UNTIL A CERTIFICATE OF COMPLIANCE HAS BEEN ISSUED BY CONSERVATION COMMISSION.
- EROSION CONTROL MEASURES SHALL BE INSTALLED AND INSPECTED BY THE CONSERVATION ADMINISTRATOR PRIOR TO THE START OF WORK.
- THE CONSERVATION OFFICE SHALL BE NOTIFIED AT LEAST TWO BUSINESS DAYS PRIOR TO THE START OF THE HORIZONTAL DIRECTIONAL DRILLING.
- ALL SEDIMENTATION BARRIERS SHALL BE MAINTAINED IN GOOD REPAIR UNTIL ALL DISTURBED AREAS HAVE BEEN FULLY STABILIZED AS APPROVED BY THE ENGINEER/OWNER. THE GENERAL CONTRACTOR SHALL INSPECT EROSION CONTROLS ON A DAILY BASIS AND REMOVE ACCUMULATED SEDIMENTS AS NEEDED. THE ENGINEER/OWNER RESERVES THE RIGHT TO REQUIRE ADDITIONAL EROSION CONTROLS AND/OR DAMAGE PREVENTION CONTROLS AT NO ADDITIONAL COST TO THE OWNER.
- CONTRACTOR SHALL IMMEDIATELY CONTROL ANY EROSION PROBLEMS THAT OCCUR AT THE SITE AND SHALL ALSO IMMEDIATELY NOTIFY THE CONSERVATION COMMISSION, WHICH RESERVES RIGHT TO REQUIRE ADDITIONAL EROSION AND/OR DAMAGE PREVENTION CONTROLS IT MAY DEEM NECESSARY.
- A MASSDEP SIGN NOT LESS THAN TWO SQUARE FEET OR MORE THAN THREE SQUARE FEET IN SIZE SHALL BE POSTED ON SITE IN ACCORDANCE WITH THE CONTRACT SPECIFICATIONS. THE SIGN SHALL BEAR THE WORDS "MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION" [OR, "MASSDEP"] "FILE NUMBER: SE280-0653". NO WORK IS TO COMMENCE UNTIL A DEP NUMBER SIGN IS DISPLAYED AT THE SITE.
- THE CONTRACTOR SHALL FURNISH AND INSTALL SILT SACKS IN ALL CATCH BASINS ASSOCIATED WITH THE WORK AREA AND AS DIRECTED BY THE ENGINEER.
- SILT SACKS AND OTHER EROSION AND SEDIMENT CONTROL MEASURES/DEVICES SHALL BE INSPECTED, CLEANED, REPLACED AND/OR REPAIRED AS NECESSARY, AND AFTER EACH SIGNIFICANT RAINFALL.
- THE CONTRACTOR SHALL STOCKPILE SUFFICIENT SOIL EROSION AND SEDIMENT CONTROL MATERIALS ONSITE TO REPAIR ANY DAMAGED SOIL EROSION AND SEDIMENT CONTROLS.
- THE CONTRACTOR SHALL NOT DISCHARGE WATER FROM DEWATERING OPERATIONS DIRECTLY INTO A WETLAND, SURFACE WATER, OR ANY STORM SEWER.
- GROUNDWATER FROM DEWATERING OPERATIONS SHALL BE TREATED TO REDUCE THE AMOUNT OF SEDIMENT CONTAINED IN THE WATER TO ALLOWABLE LEVELS.
- ALL DEWATERING DISCHARGES SHALL ALSO INCLUDE ENERGY DISSIPATION TO PREVENT SCOURING.
- REFER TO ORDER OF CONDITIONS IN APPENDIX F OF SPECIFICATIONS FOR REQUIREMENTS. CONTRACTOR IS REQUIRED TO COMPLY WITH ALL CONDITIONS.
- ANY FILL USED IN THE CONNECTION WITH THIS PROJECT SHALL BE CLEAN FILL. ANY FILL SHALL CONTAIN NO TRASH, REFUSE, RUBBISH, OR DEBRIS, INCLUDING BUT NOT LIMITED TO LUMBER, BRICKS, PLASTER, WIRE, LATH, PAPER, CARDBOARD, PIPE, TIRES, ASHES, REFRIGERATORS, MOTOR VEHICLES, OR PARTS OF ANY OF THE FOREGOING.

**CONSTRUCTION DETAILS I**

FOR CONSTRUCTION

Sheet No.

**WD-1**

- NOTES:**
- CONFIRM HYDRANT LOCATION WITH OWNER PRIOR TO EXCAVATION.
  - ALL HYDRANT, VALVE, AND TEE JOINTS SHALL HAVE RESTRAINED MECHANICAL JOINTS.
  - DEPTH OF HYDRANT BURY SHALL SUIT INSTALLED DEPTH OF COVER OVER WATER MAIN. INSTALL RISERS AS NECESSARY AT NO ADDITIONAL COST TO THE OWNER.
  - HYDRANTS SHALL OPEN RIGHT (CLOCKWISE TO OPEN).

**HYDRANT ASSEMBLY DETAIL**  
SCALE: N.T.S.

- NOTES:**
- ALL CONCRETE SHALL BE 3000 PSI @ 28 DAYS (CLASS 'A' CONCRETE).
  - DIMENSIONS SHOWN ARE MINIMUM AND ARE BASED UPON SOIL PRESSURE OF 1500 PSF AND TOTAL PRESSURE OF 250 PSI. TOTAL PRESSURE IS WORKING PRESSURE PLUS SURGE PRESSURE.
  - THRUST BLOCKS SHALL BEAR AGAINST UNDISTURBED EARTH.

TABLE OF DIMENSIONS						
D (in.)	4	6	8	10	12	14
J (in.)	6	6	7	9	10	12
K (in.)	16	16	20	26	32	36

SCALE: N.T.S.

- NOTES:**
- ALL SERVICE TUBING SHALL BE TYPE K COPPER.
  - ALL JOINTS SHALL BE COMPRESSION TYPE.
  - COPPER WIRE SERVICE LINE SHALL BE BACKFILLED WITH SAND BY HAND TO 12" ABOVE TUBING AND SHALL HAVE A SAND BEDDING OF 6".
  - WATER SERVICES SHALL BE INSULATED IN AREAS WHERE CONNECTION TO EXISTING WATER SERVICE IS LESS THAN 4 FEET.
  - ALL WATER SERVICE PLUMBING MATERIALS SHALL BE "LEAD FREE" IN ACCORDANCE WITH SECTION 1417 OF THE SAFE DRINKING WATER ACT AND SECTION 9 OF NSF STANDARD 61.

**TYPICAL SERVICE TRANSFER EXISTING WATER MAINS**  
SCALE: N.T.S.

- NOTES:**
- DEWATERING BAG SIZE AND QUANTITY SHALL BE AS NEEDED TO ADEQUATELY FILTER ALL PUMP EFFLUENT FROM DEWATERING ACTIVITIES. CONTRACTOR SHALL PROVIDE A REDUNDANT BAG ON SITE AT ALL TIMES.
  - EACH BAG SHALL HANDLE A 2", 3", OR 4" DISCHARGE HOSE.
  - DISCHARGE HOSES CAN BE PLACED ALONG ANY EDGE BY MAKING A SMALL INCISION INTO THE FABRIC, INSERTING THE HOSE, AND THEN CLAMPING THE FABRIC TO THE HOSE VIA WIRE, TIES, CLAMP, ROPE OR SIMILAR TO CREATE A GOOD SEAL.
  - CONTRACTOR SHALL AVOID DISCHARGING MULTIPLE PIPES INTO ONE BAG.

**DEWATERING BAGS**  
SCALE: N.T.S.

- NOTES:**
- ALL SERVICE TUBING SHALL BE TYPE K COPPER.
  - ALL JOINTS SHALL BE COMPRESSION TYPE.
  - COPPER WIRE SERVICE LINE SHALL BE BACKFILLED WITH SAND BY HAND TO 12" ABOVE TUBING AND SHALL HAVE A SAND BEDDING OF 6".
  - WATER SERVICES SHALL BE INSULATED IN AREAS WHERE CONNECTION TO EXISTING WATER SERVICE IS LESS THAN 4 FEET.
  - ALL WATER SERVICE PLUMBING MATERIALS SHALL BE "LEAD FREE" IN ACCORDANCE WITH SECTION 1417 OF THE SAFE DRINKING WATER ACT AND SECTION 9 OF NSF STANDARD 61.

**TYPICAL SERVICE TRANSFER TREE LANE**  
SCALE: N.T.S.

- NOTES:**
- ALL CONCRETE SHALL BE 3000 P.S.I. @ 28 DAYS (CLASS "A" CONCRETE).
  - DIMENSIONS SHOWN ARE MINIMUM AND ARE BASED UPON SOIL PRESSURE OF 1500 P.S.F. AND TOTAL PRESSURE OF 250 P.S.I. TOTAL PRESSURE IS WORKING PRESSURE PLUS SURGE PRESSURE.
  - THRUST BLOCKS SHALL BEAR AGAINST UNDISTURBED EARTH.

TABLE OF DIMENSIONS																			
DIMENSION	90° BEND				45° BEND				22 1/2° BEND				11 1/4° BEND

**CONSTRUCTION DETAILS III**

FOR CONSTRUCTION

Sheet No.

**WD-3**

**GENERAL TRAFFIC MANAGEMENT NOTES:**

- ONE LANE OF TRAVEL WILL BE MAINTAINED IN CONSTRUCTION LOCATIONS WHERE ADEQUATE WIDTH CAN BE PROVIDED FOR VEHICULAR ACCESS. (SEE TYPICAL LANE CLOSURE DETAIL.)
- AT THE END OF EACH CONSTRUCTION DAY NO TRAFFIC CONTROL DEVICES SHALL REMAIN IN THE ROADWAY; ROADWAYS WILL BE PATCHED OR PLATED AND OPEN TO TRAVEL AT THE END OF EACH WORK DAY,
- THE CONTRACTOR MUST MAINTAIN ACCESS AND EGRESS AT ALL TIMES TO ALL PROPERTIES AND ROADWAYS ABUTTING THE WORK ZONE UNLESS OTHERWISE APPROVED BY THE OWNER AND/OR ENGINEER.
- ALL DISTANCES MAY BE ADJUSTED TO FIT FIELD CONDITIONS, AS DIRECTED BY THE OWNER AND OR ENGINEER. MINIMUM DISTANCES HOWEVER SHOULD BE MAINTAINED WHERE INDICATED.
- MINIMUM LANE WIDTHS CONSIST OF THE CLEARANCE BETWEEN CHANNELIZING DEVICES SUCH AS DRUMS AND SHALL BE PROVIDED AT ALL TIMES.
- EXISTING PEDESTRIAN WALKWAYS WILL REMAIN OPEN AND CLEAR OF DEBRIS. IN LOCATIONS WHERE EXISTING PEDESTRIAN WALKWAYS HAVE BEEN IMPACTED BY CONSTRUCTION, THE ENTIRE WIDTH OF THE PEDESTRIAN WALKWAY IS TO BE RECONSTRUCTED IN KIND WITH A MINIMUM WIDTH OF 5 FEET EXCLUDING CURBING.
- MAXIMUM SPACING OF CHANNELIZING DEVICES IS EQUAL (IN FEET) TO THE SPEED LIMIT (MPH).
- CHANNELIZATION WILL BE ACCOMPLISHED THROUGH THE USE OF REFLECTORIZED PLASTIC DRUMS. PLASTIC DRUMS WITH ANY FORM OF LIGHTING DEVICE MOUNTED ON THEM MUST PASS THE CRITERIA AS SET FORTH IN NCHRP 350 "RECOMMENDED PROCEDURES FOR THE SAFETY PERFORMANCE EVALUATION OF HIGHWAY FEATURES."
- FLASHING WARNING LIGHTS AND/OR FLAGS MAY BE USED ON ADVANCE WARNING SIGNS AS DIRECTED BY THE OWNER AND/OR ENGINEER. FLAGS SHALL BE A MINIMUM OF 16" X 16".
- ALL SIGNS SHALL BE MOUNTED ON THEIR OWN STANDARD SIGN SUPPORT.
- ALL TEMPORARY TRAFFIC CONTROL DEVICES AND ADVANCE WARNING SIGNS SHALL BE REMOVED IMMEDIATELY WHEN NO LONGER NEEDED.
- PAVEMENT MARKINGS CONFLICTING WITH TRAFFIC PATTERNS SHALL BE REMOVED FROM THE TRAVEL PATH WITHIN THE LIMITS OF PROPOSED TEMPORARY PAVEMENT MARKINGS AS REQUIRED. UPON COMPLETION OF THE STAGE OF CONSTRUCTION, TEMPORARY MARKINGS SHALL BE REMOVED AND PERMANENT PAVEMENT MARKINGS SHALL BE INSTALLED IN THEIR ORIGINAL LOCATION.
- WRITTEN PERMISSION MUST BE OBTAINED FROM THE SHARON POLICE DEPARTMENT BEFORE THE CLOSING OF ANY ROADS WITHIN THE LIMITS OF THE PROJECT AREA.
- THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROVIDING, SETTING UP, AND REMOVING ALL SIGNAGE, CONES, BARRICADES, BARRELS, AND OTHER TRAFFIC CONTROL DEVICES ON A DAILY BASIS.
- THESE TRAFFIC MANAGEMENT PLANS ARE INCLUDED FOR INFORMATIONAL AND PLANNING PURPOSES ONLY. THE CONTRACTOR SHALL SUBMIT A TRAFFIC MANAGEMENT PLAN TO THE SHARON POLICE DEPARTMENT FOR APPROVAL PRIOR TO CONSTRUCTION.

## APPENDIX U

### Supplemental Water Quality Data

Wells 2, 3, and 4 Water Treatment Plant  
Sharon, MA  
Appendix U - Supplemental Water Quality Data

Description	Units	Influent Water			
		Min	Avg	Max	
Operational Flow Rate	gpm	590.0	889.0	1285.0	
Operational Schedule	hour/day	24.0	24.0	16.0	
Daily Volume (average)	Gallons	849600	1280160	1280277	
Sulfate	mg/L	12.7	14.2	16.9	
Nitrate (as NO <sub>3</sub> )	mg/L as NO <sub>3</sub>	3.8	4.4	7.0	
Alkalinity (as CaCO <sub>3</sub> )	mg/L	45.5	65.4	93.0	
Chloride	mg/L	78.3	114.8	204.0	
Fluoride	mg/L	0.10	0.40	0.69	
Perchlorate	ppb	0.14	0.24	0.36	
Calcium (as Ca)	mg/L	18.8	26.9	38.6	
Magnesium (as CaCO <sub>3</sub> )	mg/L	7.2	10.65	14.0	
Sodium	mg/L	25.1	57.0	110.0	
Potassium	mg/L	1.3	19.9	40.1	
Iron	mg/L	0.01	0.09	0.12	
Manganese	mg/L	0.001	0.019	0.032	
pH		6.9	7.6	8.2	
TDS	mg/L	295.0	342.3	338.4	
Total Organic Carbon	TOC	mg/L	1.3	1.6	1.9
Perfluoroheptanoic acid	PFHpA	ng/L (ppt)	2.5	3.0	3.7
Perfluorooctanoic acid	PFOA	ng/L (ppt)	6.9	9.1	12.9
Perfluorononanoic acid	PFNA	ng/L (ppt)		2.0	
Perfluorododecanoic acid	PFDoDA	ng/L (ppt)		2.0	
Perfluorohexanesulfonic acid	PFHxS	ng/L (ppt)	18.1	23.6	31.8
Perfluorooctanesulfonic acid	PFOS	ng/L (ppt)	15.7	21.3	33.0
PFAS6		ng/L (ppt)	43.2	59.0	81.4
Volatile Organic Compounds	VOC	ppb	See Below for List of Detected VOCs		

**List of Detected VOCs:**

Well 4 - Acetone - 16.9 ug/L 8/17/2021

Well 4 - 124-48-1 Chlorodibromomethane - 3.2 ug/L 7/23/2020

Well 2 & 3 - 124-48-1 Chlorodibromomethane - 2.8 ug/L 7/23/2020
